Sacramento River Improvement

Proposed new channel of Sacramento River for 15 miles above its mouth. Copied from map furnished by California Debris Commission. The new channel shown by the heavy dotted lines will have a uniform width of 3000 feet. The work now contemplated will increase the flood discharge by more than 50 per cent; when fully developed by dredging the flood capacity will be 3½ times that of the present channel.

2000 WHITE LEGHORN HENS, $10 PER DOZEN

RIGHT NOW

We have 2000 White Leghorn hens and pullets contracted for. Most of them are 10 months old; as long as they last we offer them at $10 per dozen in dozen lots and we pack and ship them anywhere. Cocks are $2 each.

These hens and pullets are all young and are standard stock, all are pure white and healthy. If you need hens or pullets of the White Leghorn, right now is the time to get them. By September they will be selling at $1 each or more and will be practically impossible to obtain.

We are selling three-months-old Buff Orpington pullets and Rhode Island Red pullets at $9 per dozen. Write us for any kind of grown poultry. FREE 32-page book mailed on request. We are still selling 10,000 chicks per week.

Pioneer Hatchery Co., 112 E. 8th, Los Angeles

Wholesale 360 Acres Retail

Smyrna Park Nurseries

Ceres, California

A complete line of Nursery Stock. Special prices on Peach, Plum and Apricots. It will pay you to let us figure with you before placing your order for Spring planting. All stock guaranteed true to name.

Smyrna Park Nurseries

Campin & Moffet, Prop's.

MELON SEED

We have taken great care in procuring the best grades of Melon Seeds. The principal varieties we have grown under our personal supervision.

Water Melons—We offer the leading varieties of tested merit. We especially recommend our Black Seeded Chilean at $1.25 per pound and the Pasadena at $2.00 per pound.

Musk Melon—We have the Model at $2.50 a pound and Gautier's Pineapple at $1.25 a pound. These are both of proven qualities, being the best varieties for market purposes. Try some of our Red Rover at 15c an ounce, $2.00 per pound.

EUCALYPTUS

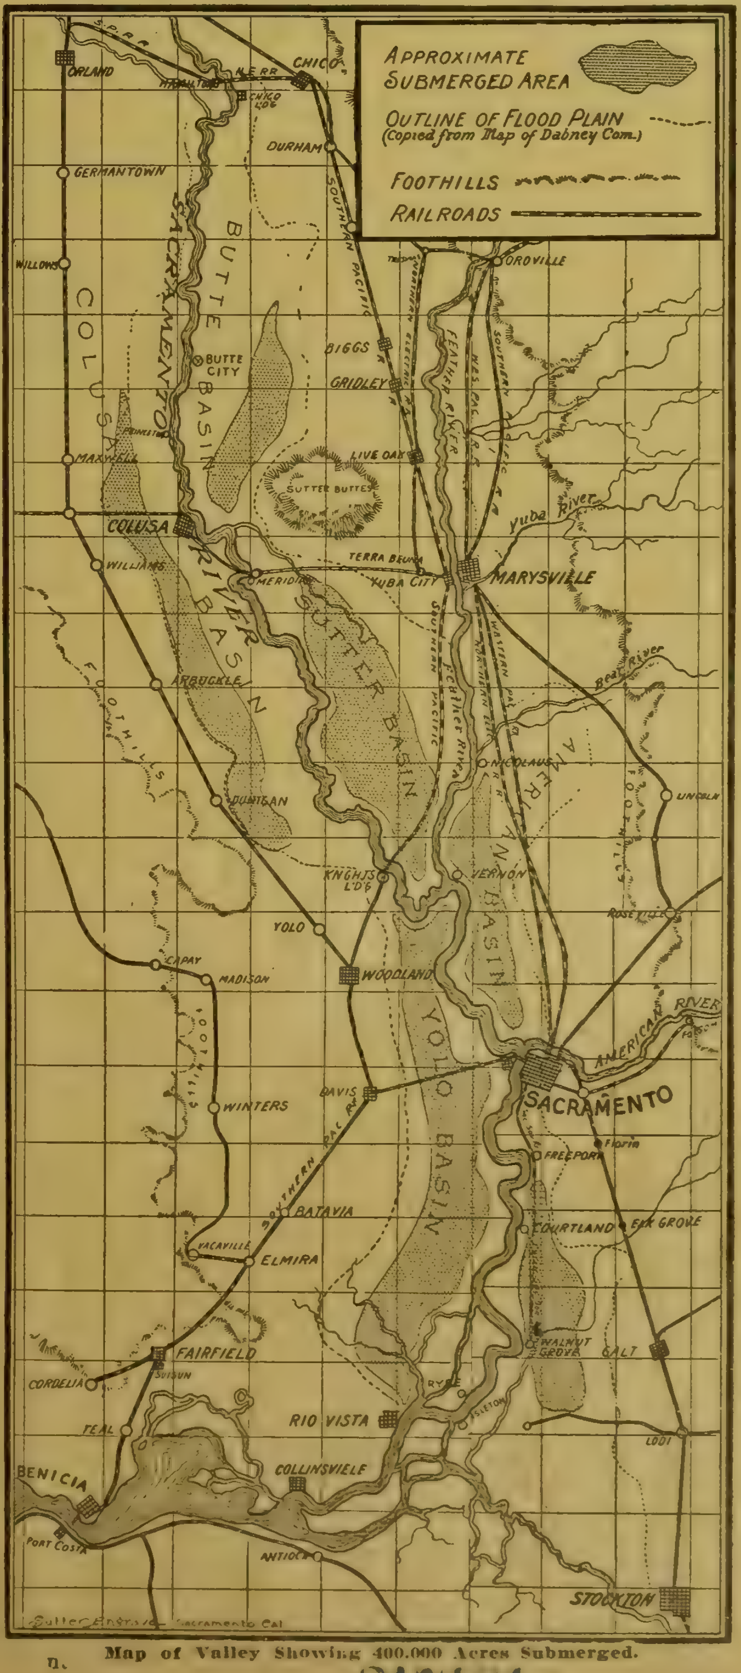
Where the Three Rivers Meet Near Rio Vista.

Sacramento River Improvement Proposed

Nearly a million will be spent on the lower Sacramento river within the next few years. It will save vast damage to lands above and it will add vastly to productive power of those lands. It is a step which will lead to greater ones and calls for hearty congratulations to the people of the Sacramento Valley. The map on the cover page gives a clear idea of the contemplated improvements.



Map of Valley Showing 400,000 Acres Submerged.

THE State of California has appropriated $400,000, the Congress of the United States is about to appropriate $400,000, making a total of $800,000 which will soon be available for the improvement of the Sacramento river, "Provided all rights of way needed for levees and spoil banks have been furnished the United States free of cost."

These rights of way, which must be furnished by persons, corporations and municipalities interested, will cost about $225,000, making a total of one million dollars to be expended in widening and dredging the mouth of the Sacramento river.

The present channel of this stream for a distance of 15 miles above its mouth is very narrow and affords an insufficient outlet for the waters that accumulate in the river and adjacent basins during flood periods. The improvement contemplated is designed to facilitate movement of the flood waters to Suisun bay by providing a flood channel of adequate capacity. With this object in view the channel from Rio Vista to Collinsville, which is now only about 700 feet in width at the narrowest places, is to be given a uniform width for the 15 miles of, about 3,000 feet. This will give an immediate increase of fifty per cent in flood capacity, and afford opportunity for further increase by dredging to more than three times the present capacity.

This work has been proposed by the California Debris Commission, composed of Engineers of the United States War Department, and it is a part of a great plan designed to effect the control of the Sacramento floods. This plan has been in preparation for some time and will be submitted to the Chief of Engineers in the early future. It contemplates the progressive improvement of the entire river system from the mouth at Collinsville to the heads of navigation at Red Bluff and Marysville.

No pen can adequately describe the manifold advantages of the improved lands of the California delta. One of the most delightful excursions in California is afforded by the river steamers which ply these streams. Orchards border the river in almost unbroken line, and beyond these are vast tracts devoted to vegetables of many kinds, alfalfa and other farm crops. The river is lined with handsome homes.

It is of the greatest importance to the entire Sacramento Valley that this project for the improvement of the mouth of the stream be undertaken and pushed to completion. An enlarged outlet at the river's mouth will open the way for enlargement of flood channels up stream.

It is of especial importance to the city of Sacramento, situated on the bank of the river, in the heart of the vast fertile territory to be benefited, and itself within the flood zone. It must be borne in mind that the great basins lying on either side of the river, which now afford vast storage capacity and to an extent equalize the flood flow, are about to be reclaimed and that as this reclamation progresses some adequate provision for passing the floods must become an imperative need of this city. These basin lands are among the most productive in the state, and their reclamation is very much to be desired, especially by the city of Sacramento, of which they will become a chief asset. The loss of storage space involved in their reclamation entails a greater problem which must be met either by enlarging the river channels or by raising the city levees.

About one-half of the amount necessary for the purchase of rights of way needed for the improvement now contemplated has been subscribed, and

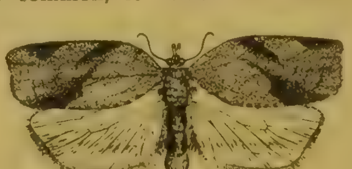
Citrus and Sub-Tropical Fruits

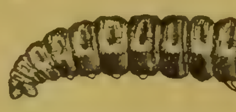
The ORANGE TORTRIX.

By Prof. A. J. Cook.

IN 1901, my attention was called to the work of a tiny caterpillar on the orange, in the orchard of Mr. Davenport, one and a half miles south of Claremont. Examination showed that the mischief was wrought by a small larva, one of the leafrollers, related to the well known codling moth. It was found that the caterpillar worked on the fruit and also on the foliage. Close examination proved that only about one orange in 100 was attacked, and as the late Alexander Craw reported to me that he had known the insect for twenty years, and so far it had not done any serious damage, I was thus led to believe that unless the insect changed its habits, or became much more common, it was no serious menace to our favorite Southern California industry. Almost every year since I have known of this little moth, and have not supposed it was a matter of any great importance, though I was a little anxious, as we may never know when the balance of nature in such cases may be interfered with, and a comparatively innoxious insect become a serious pest.



Early this season, I received a communication from a county commissioner, with the report of an orchardist in Los Angeles county, in which it was stated that this insect was doing great injury, and that this was the second year of very serious loss. I at once wrote the party, and received several boxes of the injured fruit. From this we have reared the moths, and are prepared to advise as to treatment.



The moth is known to science as Tortrix citrana Fernald. The imago, or mature moth is well shown in figure, which is magnfied 2½ times. It is yellowish brown in color, with dark markings as seen in the figure. The posterior wings are white, the palpi, head and thorax are the same color as the front wings, yellowish brown, while the abdomen is the color of the spots. The palpi are porrect, that is they extend straight forward from the head. The peculiar Tortrix form of wing, and the venation characteristic of this family of moths is well shown in the figure, which was drawn by one of my students, Mr. K. L. Carver.

The eggs are laid on the leaves or the fruit, and are very minute. The larva or caterpillar is very similar to the apple worm, Carpocapsa pomonella, which is familiar to all. It is well shown in the figure, five times magnified, also drawn by Mr. Carver. It is whitish, and when fully grown, leaves the fruit as does the apple caterpillar, to pupate in some crevice or other place of concealment. Like the apple worm, it spins a delicate cocoon. The pupa is not especially different from other pupae of tortricides.

The larva works in a small cavity eaten in the fruit, and the opening is concealed by a thin web. As with the apple or codling moth, there are two or three broods a year. As Dr. Fernald states in his description of this moth, that it works on golden rod and cherry, it would seem that it may be a native of California, and to have taken to the orange in preference to its native food. It may be, however, that both these conjectures are untrue and that it has been introduced on the orange from some other region, and that its old time food plant is the orange.

Remedy.

In case this continues to work havoc, especially if the mischief spread, then we must fight it just as we fight the codling moth. In this case we had better use the lead arsenate, 2 pounds to 50 gallons of water as a spray. In case the red mite (so called red spider) is doing us harm at the same time, which is very likely to be true, then we may mix the poison with the sulphur liquid used to destroy the mites and secure a double benefit. The lead arsenate is as effective as Paris green and never burns the foliage. Of course the spray must be thoroughly applied or it would not reach all leaves and fruit, and so would not be effective. The best time to apply it is yet to be determined, though it would be likely to be in the early spring. It might be thought to be dangerous to recommend this poison on fruit, yet I think the danger would be very slight. The amount on any single fruit would be very little, and that is on the peel, and would not remain long.

ADVANTAGES OF DEEP CULTIVATION.

W. F. Sutherst, Ph. D., F. I. C., Bishop, Cal.

A NUMBER of root diseases of farm crops can be attributed to bad soil aeration, due to imperfect cultivation; this is especially the case with some root crops such as beets. The surface soil is generally porous and consequently contains an ever changing supply of air, and being the only portion receiving manure, is swarming with bacteria, consequently the surface crops will grow well under ordinary conditions, but if encouraged to penetrate deeper into the soil, usually some of the roots are destroyed. It is peculiar that some plants such as alfalfa and trees can send their roots over 30 feet into a soil and flourish, yet others must keep to the surface. There must be some material difference in the structure of these roots to allow one to live where the other would perish.

One learns in the schools that carbonic acid gas is absolutely essential for plant growth, but it is rarely impressed on people that oxygen is also quite as necessary; every growing part of either animal or vegetable, requires this gas. True, in the latter case a very small quantity is essential as compared with the former. Since both leaves and roots are growing, both will need oxygen; leaves can get what they require from the air, but the roots have to depend upon what

they can get out of the soil, which in any case is very small compared with the quantities above ground. The amount of air in surface soil is about 35 per cent of the soil volume, but only one-fifth of this is oxygen, in normal conditions, but owing to the absorption of this gas by decaying vegetable and animal matter, it sometimes falls to one-tenth of the whole. Subsoil naturally contains less as the pressure of the top layers compresses it, then water is more liable to collect and fill up the air spaces, consequently the proportion of air to soil is frequently one to ten.

Roots have a natural instinct for food search, and will wander first for water, next for mineral matter, but all the time these growing root ends need air-oxygen, and if they reach a place where no oxygen exists, decay takes place. The tap roots will cease to work, and the side roots take up their work, consequently a spreading in a horizontal direction is the result. This prevents planting the ground to its full extent and possible loss. If the soil is cultivated deeply, air penetrates into the subsoil and the roots find a suitable place for growth. Depth of soil is included in the area, and should be utilized to its full extent, but area is limited and everything should be done to make profitable the space at one's disposal.

In addition to the growing parts of a plant needing air, other soil inhabitants of vital importance to the farmer need it. There are the different kinds of bacteria which exist in such enormous quantities near the surface. The fact of them existing in that part of the soil, is obviously due to their need of air and a small quantity of moisture. The deeper one penetrates the soil, the less the number of microbes and the amount of air, but the greater the amount of water. Once the ground is opened up, there are two ways by which the air is carried down; one is by diffusion, that is a process of gas mixture taking place without external agencies when two different gases are in contact, the particles penetrating each other till complete mixture is obtained; so if fresh air can be brought in contact with the bad air of the subsoil, an involuntary renewal is bound to take place. The other means of air renewal is by rain or irrigating; the seeping water drags after it a supply of fresh air.

It is not only the root system which depends upon an oxygen supply for plant growth, but the fertilizing matter in the soil, which, with free access of air is converted into easily assimilable plant food, as its decomposition only takes place when air is present. The complicated organic matter of barnyard manure, corn stalks, roots, etc., must be converted into very simple substances before the roots of growing plants can absorb it.

A loose subsoil is essential for growth of root crops. We know that potatoes grow best in such soil, which sometimes occurs naturally and can be equally well produced by artificial means.

Plowing the first few inches means that the subsoil becomes year after year more impervious and less productive, and even the surface soil does not get the benefit it should, as the top layer is turned over just when it is getting into a good condition as to weathering and bacterial life, and a raw unfertile layer then takes its place. By deep cultivation alone, the air is taken down and the microbes will follow it. In this way we get a thick stratum of fertile soil, and weathering will liberate mineral plant food, so altogether the full power of the soil is utilized.

UNIVERSITY WORK IN SOUTHERN CALIFORNIA.

TO care for the diverse needs of California agriculturists the State Experiment Station working under the University of California, has established stations in different sections. Citrus conditions in the south long called for solution of problems which could only be studied on the ground. A few years ago urgent request was made of the State University and pushed especially by Mr. J. H. Reid and others of Riverside, which resulted in the establishment of the Southern California Pathological Laboratory which was ultimately located at Whittier. To meet the more immediate needs of growers in the great citrus section of Riverside, that was chosen as the location for experiment grounds to be conducted under the direction of the pathological station. These grounds have been put in charge of Prof. J. H. Norton, while Prof. Ralph E. Smith is in charge of the entire work in Southern California.

The regents of the university are required to adopt a general plan of work before the beginning of each fiscal year, which shall describe investigations and experiments to be pursued during the year. It is their duty to receive and consider written statements from individuals and associates interested in branches of horticulture, conveying plans or suggestions for investigations which they may approve or desire. Acting under this plan as fixed by the law establishing the Southern California station, Prof. E. J. Wickson recently submitted to the board of regents the following general plan and schedule for the year beginning July 1st:

The effort to circumvent the walnut blight will continue with studies of immune varieties which have been gathered and planted in the vicinity of the Plant Disease Laboratory at Whittier—including careful explorations for trees which are productive in spite of the blight in various parts of the state. Scions are taken from such trees and grafted into various stocks on our own ground so that systematic observations can be made, and are also grafted into trees in other regions so that practical tests of value under commercial handling can be had. We are also testing a large number of wild walnut species and hybrids to determine suitability for root stocks of the English walnut in various soils and moisture conditions.

Investigations in orange growing will be extended. Particular study will be made of "brown spot" which has caused great losses in shipping Preliminary work with this disease has yielded encouraging results and commanded the interest of growers who will cooperate with us by testing preventive measures in their packing houses. Gum disease and "yellowing" of citrus trees will be continued. Fertilization will be studied through field experiments and laboratory tests under conditions determined by analysis. All features of this effort will be extended to demonstrate tentative results already attained.

THIS BOOK FREE

52 pages of vital importance on how to save money by buying from the Largest Mail Order House in the West. The Secret of Better Buying is a matter of vital value to every household; to know where every dollar goes to bring the best results is a protection to the home. Our Grocery Catalog is the messenger of wholesale prices, heralding what goods are actually worth. It delivers you from high prices.

OUR PRICES are one-fourth to one half less than your local dealer's. If his price is $10 for an article, you can buy the same thing of us through our catalog for $7.50 and less. This applies to all classes of goods. Because of this enormous saving, most of our customers buy all their supplies of us. They consult our catalog every time for any goods they use. It is a reference book on low prices. They save at least 25c on every dollar's worth of goods they buy from us. It's worth while to save 25c on every dollar's worth of goods you buy. The 25c saved is just like you had worked hard to earn it.

IT WILL PAY you big to buy all or as much of your goods as possible through our catalog. Besides the great saving you can make through trading by mail with us, it's the easiest and most satisfactory way of buying goods. there is no hurry or confusion, no worry that you are taking up a salesman's time if you are a bit slow in making a selection, and in the seclusion of you home, surrounded by your family you can select the goods you need from our big catalog with best judgment and greatest economy. The United States mails will speedily bring us your orders and flying express, mail or freight trains will carry the goods to you with the greatest dispatch and perfect safety.

OUR GUARANTEE is to safeguard your interest to every extent that we will give the service you have a right to expect, we stand back of every statement we make and your money, together with transportation charges and any further expense you may have incurred, will be promptly returned to you if you are not satisfied. Every article in this catalog is, therefore, offered with the understanding and agreement that it must satisfy you perfectly, and if there is the slightest dissatisfaction because of quality, style, size, color or any other reason, we expect you to return the purchase to us at our expense. Does the retailer make you this offer? Ask him! REMEMBER THAT THE RISK IS ALL OURS.

HORTICULTURAL COMMISSIONERS AND COUNTY SUPERVISORS MEETING.

FOR sometime State Horticultural Commissioner Jeffrey has felt that there was not the harmony existing between the county commissioners and the state office, and between the county commissioners and the county boards of supervisors, that there should be to accomplish best results. In some counties in which horticultural interests are predominant, the board of supervisors has often treated the horticultural commission as a plum with which to pay political debts. The law passed by the last legislature was inspired by a desire to forestall political action in this important office, but through lobbying, amendments were added so that the desired point was largely obliterated before the bill reached the governor. Commissioner Jeffrey thinking the result might be secured by bringing together supervisors and horticultural commissioners, called a meeting at Sacramento June 24th and 25th. Nearly all sections of the state were represented by horticultural commissioners present but the supervisors were less in evidence. These were the ones which have the lesser need of this interest for those not represented are amongst the number who give less attention to the greatest industry of the state. We give below comments on the meeting by the Cultivator representative attending.

By John T. Bramhall.

Mr. Jeffrey explained the purposes of the conference as designed to secure a better and more effective co-operation between the county horticultural commissioners and the county supervisors. Special efforts had been made to secure the attendance of the supervisors so that views might be exchanged and a better understanding arrived at. He regretted that the attendance in this particular was so small, only six counties being represented, but those who were present would be treated as representatives of the rest. Mr. Jeffrey explained that the objects for which the horticultural commissioners were working were not selfish, or political, but were state-wide and indeed included the general agricultural interests as well as those of the fruit grower. The county horticultural commissioner labored for the grain farmer, the alfalfa growers, the beet growers, the hop men, the truck growers and all the varied interests of agriculture. As these producers sold their crops, as had been pointed out, for upwards of two hundred million dollars and paid out large sums for supplies, for labor and for freight, it would seem that their interests were not limited by occupation or section. He said that the policy pursued by some of the counties in ignoring and restricting the work of the horticultural commissioners was short-sighted and could only result in loss to the agricultural interests. Where one county in the south cheerfully appropriated $30,000 to the work of the horticultural commissioner, another reluctantly doled out a hundred dollars. And both counties got the worth of their money. Mr. Jeffrey called for heart to heart talks without any playing of politics or grinding of axes.

A resolution introduced by Roy K. Bishop, horticultural commissioner of Orange county, was passed, advocating the attendance by horticultural commissioners upon the farmers' institutes, granges and state and local fruit growers' meetings. In this way information can be given in answer to questions by growers and an opportunity will be offered to show what the horticultural commissioners are doing.

Prof. Elmore Chase, deputy horticultural commissioner of Sacramento county, cited instances where hundreds of acres of the best land of the state had been rendered unproductive by Johnson grass, wild morning glory, thistle and other weeds, with instances of reclamation through the aid of the horticultural commissioner.

Prof. Chase was appointed by the chair to prepare a resolution outlining a scheme to enlarge the influence and usefulness of the commissioners, but this plan of making them professors in a traveling university was too utopian to suit the general taste, and an amendment offered by Frank T. Swett, of Contra Costa, was adopted after long debate, recognizing the work of the county commissioners in instructing the growers and disseminating useful information but at the same time reminding them that they are to see that the law is obeyed.

Powers of Commissioners.

During the discussion an interesting and important point was brought out relating to the powers of the horticultural commissioners in compelling the destruction of weeds. In one of the southern counties the Russian thistle had appeared in threatening numbers on lands contiguous to another county where no effort had been made to clean up. Farmers argued that it was useless to attempt to clean up when the main trouble came from the other county. Now what authority had the horticultural commissioner in his own county, and could he invoke state aid as regards the neighbor county? "Go ahead and clean up in your own county," replied Commissioner Jeffrey, "you have full discretion and power; and then invite co-operation from your neighbor."

Judge N. P. Chipman, of Tehama county, spoke on the legal aspects of the horticultural commissioner's work and outlined the duty of the commissioners in going about the county policing the orchards and fields to see that moth nor rust do not corrupt nor pests break in and steal. It is the duty of the supervisors, he declared, to back up the action of the commissioners and uphold the administration of their office. They are county officers charged with a special and delicate duty for which they are peculiarly fitted. In the discharge of their duty they may cause considerable expenditure of money on the part of the county or of individuals, but it is for the public good, and in accordance with the laws which have been enacted and they should be sustained.

Commissioner Jeffrey asked the appellate court justice if it is a sound principle of law to force a man to clean up his orchard or do it and charge him with the cost. The judge replied that it certainly was, on the principle that a man must not use his property in a way to injure his neighbor. The public must be protected against the careless ones who create a nuisance.

Saving at the Spigot.

Eben Boalt, of Butte county, showed how the county supervisors might save at the spigot and waste at the bung. In his county some years ago, the yellow scale and the white fly managed to get control because the supervisors would not give a hundred and fifty dollars to carry on the necessary work of eradication. But the scale and the fly have done incalculable injury. The scale was located on one tree that had been brought into Oroville, and was allowed to spread over the city and into surrounding orchards.

Commissioner Jeffrey further explained that the "saving" of this $150 cost $5,000 in a fumigation bill alone and tnat spraying and other work ran the cost above $15,000. Every dollar paid o t for prevention is a good investment. Lack of co-operation means an expensive bill to the taxpayer.

Mr. George E. King, of Fair Oaks, presented a resolution which was adopted urging the boards of supervisors to post themselves on the horticultural interests and the necessity of their protection, and recommending the horticultural commissioners to make frequent reports and to hold conferences with the supervisors so as to get a better understanding on the work in which they are engaged.

The Plague and the Squirrel.

As an instance of the broadness of the conference and showing that the horticulturists do not limit their activities to narrow lines, Dr. W. F. Snow, secretary of the state board of health, was given the floor to present the status of the bubonic plague problem and the relation of squirrels thereto. Dr. Snow said the squirrel is not only the original plague carrier, communicating the disease to rats and so to man, but he is also the enemy of the orchardist, and so cooperation is asked, if protection of life is not a sufficient argument. The department of agriculture has no funds that can be devoted to a squirrel campaign, as he learned on his recent trip to Washington. The public health and marine hospital service is expending $14,000 per month in fighting the plague, and the state board of health, on behalf of the people more directly concerned, can spare but $1,500 per month to protect California from a plague.

Resolutions were passed endorsing the methods of squirrel extermination as suggested and urging the co-operation of county authorities.

For a County Office.

The closing session of the conference was occupied in discussion c the equipment of the county horticultural commissioners' offices, and the problem of securing more economy and effectiveness in their administration. On the first head it was urged that the horticultural commissioners were county officers, entrusted with great responsibilities and wide powers and should be, to use the military language, "obeyed and respected" accordingly. He should provide himself with a library of reference books and bulletins, for his own use and for the public, and should have in a suitable case a collection of the harmful insects of his county, properly labeled, with the parasites employed for their extermination. Such an exhibit would be of great value to the farmers and fruit growers and would go far, in the estimation of the public, to justify the expenditures of his office.

"Clean up."

James Mills, of Arlington, Riverside county, made an eloquent appeal to fruit growers to "clean up." He pointed out that notices had been given by Oregon, Washington and British Columbia that no oranges or lemons would be accepted unless entirely free from scale. Soon the interdict would be general, and the citrus fruit would be thrown back upon the grower or burned, if at all infected with scale. Eight years ago, he said, the orchards in his county were in very bad shape and ruin was threatened, but the protection afforded by intelligent horticultural commissioners supported by a wide-awake board of supervisors, had been the salvation of five thousand acres of orchard. Enforcement of the law by the county commissioners, with the hearty support of the county supervisors, was the thing urgently needed.

The conference spent Friday evening at the state insectary, where attendants were pleasantly entertained by the office force. Mr. Frederick Maskew, in charge of the insectary, explained the beneficial labors of the vedalia, the hemencytus, anastatus, aphelinus, and others of the orchardists' friends, and said that for the past twenty-five weeks he had been sending out these soldiers of the pest crusade at the rate of a million and a quarter a week.

Horticultural Commissioners Organize.

On Saturday the last day of the session the horticultural commissioners met and organized as a state association. Roy K. Bishop, of Orange county, was elected president, and Earl L. Morris, of Santa Clara county, was chosen vice-president. Harry P. Stabler, of Yuba county, who had previously declined the nomination of president, was made secretary. An executive committee was appointed by the chair to map out work for the association. Santa Rosa was selected as the next place of meeting, and the second Monday in October as the time.

Bartletts are now amongst the heaviest shippers in green fruits.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

FEEDING COTTONSEED MEAL.

Editorial in Experiment Station Record.

THE injurious effect which often follows the feeding of cotton-seed meal to certain kinds of live stock has been a subject commanding much attention from the experiment stations almost from their establishment. The loss which has followed cotton-seed meal feeding, especially with pigs and calves, has detracted greatly from the use whih could be made of this exceptionally rich material, and has made a better understanding of its physiological effect a matter of the greatest importance. For obvious reasons it has been recognized as one of the live problems of the stations in the Southern States, and the desirability of a wider and more safe utilization of this home product has lent a special zeal to the investigation. It has been made a prominent project under the Adams fund at a number of places.

These studies have been pursued from the standpoint of the chemist, the veterinarian, and the animal feeder. Chemical investigations have been made to discover if possible the character of the toxic body, and extracts of various kinds have been examined as to their composition and their toxicity. The symptoms of affected animals have been extensively observed; and a great variety of feeding experiments have been made with different mixtures and methods of feeding, in the attempt to get a clue to the nature of the difficulty and the practical means of avoiding or overcoming it. It has been variously ascribed to the lint, the oil, the high protein content, to a toxalbumin or toxic alkaloid, to cholin and betain, to resin present in the meal, and to decomposition products.

But despite the amount and diversity of the study, the cause and nature of the toxicity have continued to baffle investigators, and the problem has been greatly confused by variations in the toxicity or an entire absence of it, difficult to account for on the ground of individuality of the experimental animals. At an interesting stage in the study it would be found that the animals did not seem to be seriously affected by eating the meal in considerable quantities, and in certain localities injury was far less prevalent than in others. These things have served to interrupt the investigations, to make the point of attack more difficult to discern, and to lend complexity to the whole problem.

It is a matter for congratulation, therefore, that the cause of the poisoning and the reason for the variation in this respect now appear to be explained by studies which have been going on in the Bureau of Animal Industry of this Department, under Dr. John R. Mohler, and are now announced in a preliminary way. The laboratory and pharmacalogical studies have been conducted by Dr. Albert C. Crawford, who in an article which has just appeared describes the method of procedure which was followed in studying this problem, and presents his deductions as to the causative agent.

To the surprise of many, Dr. Crawford finds the poisonous principle not to be an alkaloid, and probably an inorganic rather than organic body—a salt of pyrophosphoric acid. Phosphoric acid has long been known to be present in cotton-seed meal in considerable quantity, and has been suggested as having a possible relation to its toxicity; but the methods of study followed have not been such as to bring out this relationship or lend support to the hypothesis.

Dr. Crawford's results seem conclusive, and are supported by a large amount of data from a systematic series of laboratory studies and physiological tests. The findings have been confirmed by feeding experiments with pigs, carried out by the Bureau, which are not presented in the preliminary paper. These feeding and pathological studies, together with the laboratory investigations, are to be published later as a bulletin of the Bureau. The preliminary notice is issued at this time because of the interest in the progress of the work which has been manifested by several of the experiment stations now engaged in studying the problem. The present account is sufficiently detailed and comprehensive to indicate the character and scope of the investigation, and it will make it possible for other investigators in this field to redirect their studies and to co-ordinate them with those of the Bureau.

Starting with the product which would be digested by the animals, that is, the extract prepared by digesting cotton seed with pepsin and pancreatin, the extract was concentrated and studied in its toxic effects on rabbits. Whole cotton seed of known origin was used in a number of cases, which was first ground and extracted to remove the fat. The same variations in toxicity which had been noticed in other experiments were encountered. It was found that while the seed from Upland cotton was quite generally poisonous to animals, that from certain Sea Island cotton contained so small a quantity of the poisonous principle as to be practically harmless. The toxic effect of the Sea Island seed, however, was greatly increased by heating, indicating that if in the treatment of the seed at the oil mills the temperature rises high the poisonous principle is developed. This is due to a conversion of part of the orthophosphoric acid into the pyro form, a reaction familiar to chemists.

This explains in an interesting way the differences which have been observed in the meal from different mills. Several experiment station workers have expressed the belief that the process of manufacture often has an important relation to the poisonous properties of the seed. At one station pigs were fed continuously and heavily on cotton-seed meal from a nearby mill without the slightest injury being apparent, but when

a change was made to a lot of meal shipped in from an adjoining state cases of poisoning soon followed. Less easily explained is the observation of Dr. Crawford that Sea Island seed grown in Florida proved poisonous even without heating, approaching in this respect certain varieties of the Upland cotton. This remains for further investigation.

In the study of the extract containing the digestive products, it was found that lead and copper acetates precipitated a toxic agent which gave the usual symptoms of cotton-seed meal poisoning when fed to rabbits, while the filtrate from this precipitate remained inactive. On decomposing the lead precipitate with sulphuretted hydrogen and concentrating in vacuo, a red gummy material was obtained which fed to rabbits produced an intense gastro-enteritis and induced death in about an hour. From this material crystalline needles were obtained after standing about eight weeks, but these crystals proved physiologically inactive, while the gummy matrix continued to produce the poisonous effects, suggesting that the active principle was an amorphous body One after another suspected compounds were eliminated from consideration and the active principle was shown not to be a toxalbumin, a glucosid, and probably not an alkaloid. But it yielded precipitates with ammonium molybdate, magnesia mixtures, and the acetates of such metals as lead, mercury, and cadmium, indicating the presence of some form of phosphoric acid, which ultimately proved to be the case. The substance responded to reactions for pyrophosphoric acid, which is known to have poisonous properties, and is a soft glassy mass crystallizing only at low temperature and after months of standing.

(Concluded next Week.)

. A CORRECTION.

In the illustrated article on Dutch Belted Cattle which appeared in last week's Cultivator we described particularly three young animals just brought to this state by A. M. Mitchell and Sons of Redlands. This stock was brought from New Jersey by Mr. Mitchell and he proposes to secure some of the finest of this striking breed to be had in the East. The illustration and some of the facts given were very striking and indicated the worth of this breed, but in the article in question we made the mistake after naming Mr. Mitchell and Sons, of referring to them as the "Millers" and again referring to "Mr. Miller." This, of course, was a typographical error, the name Mitchell being made "Miller," which some might have taken to mean that there were two different breeders referred to by the article. Another point which might have been misunderstood was that made in referring to the capacity of one Dutch Belted cow exhibited at the World's Fair at Chicago, as being "sixteen quarts every day in the year for six years." Strictly, of course, such a statement could not be true, but we take it for granted that readers understood that sentence to mean that the average of this great cow was sixteen quarts daily.

Over 200 acres of grain were burned in a field fire near Hamilton City last week.

SAN DIMAS CITRUS NURSERIES **R. M. Teague, San Dimas, Cal.**

Small Fruits and Vegetables

THIS MONTH.

THIS is a difficult month to grow plants from small seeds. Some gardeners will plant lettuce, radishes and other small plants in soil which has not been mulched or fertilized with coarse manure for years, and expect the seeds to come through the crust which forms after sprinkling and do well. Best results cannot be secured by such a plan. If a fine mulch can be had or well rotted manure be spaded into the soil, it is possible that seed may be started now, but that will require care and shade given by muslin cover or frames on which old sacks have been tacked so as to prevent crust from forming.

Sow radishes, lettuce, beets, onions, cauliflower and cabbage seed, and plant green and lima beans. Tomato seed for winter crop may be planted now. Of course, it goes without saying that a patch of green corn should be planted almost every week for some time yet. In addition, the corn planted earlier should be given plenty of water until the roasting ears are off.

Fight the aphis and the bugs persistently. They quickly accomplish the ruin of young plants.

GROWING SQUASH.

THE principal reason for getting a good stand of squashes is in the rapid growth of the young plants to aid in combating the squash borer and beetle. At least a dozen seeds should be placed in one hill, so as to be sure of a good stand and afterward thinned to at least three plants after the beetle season is passed, and more room is demanded by the young plants for growth. The seeds should be planted not over three-fourths to an inch in depth, and distributed about the hill, and covered with finely pulverized soil.

The field adjacent to the rows of plants should be cultivated deeply and the centers between the rows should be harrowed well to keep down the weeds until the vines cover the surface. They should be cultivated deep and often, and the surface about the hills raked over well with a garden rake.

At the last cultivation, which is made after the vines have a good start, a good quantity of soil is drawn with the hoe well up over the roots and stems of the plants, preventing materially the destruction from borers, which work in the root and stem of the plants. Frequent dustings of stove soot, air-slacked lime and plaster of Paris mixed, is a good preventive for the attacks of the beetle. This mixture should be lightly sprinkled when the dew is on. The large gray squash bug must be picked off to prevent further destruction.

Additional fertilizer in the form of nitrogen can be added profitably by applications of nitrate of soda worked in for several inches adjacent to each hill during the summer cultivation. One-third of a pound at each application is about right, and may be made at the time of thinning, at the time the plants are budding, and when small fruits are setting. This will insure fuller matured specimens, dry and sweet, and with hard, thin shells, indicating better keeping qualities.—Southern Fruit Grower.

HOW TO FERTILIZE STRAWBERRIES.

Strawberries delight in a rich soil, and respond readily to liberal application of fertilizer. While paying crops can be grown on good ground without any fertilizer, a liberal use of fertilizer will greatly lessen the tendency of the fruit to run down in size—a desideratum greatly to be desired by the grower.

Stable manure is an excellent and complete fertilizer, but few growers have it, or can procure it in sufficient quantity. It is best applied the year before and the ground planted to corn or potatoes, and kept well cultivated and rigidly clean.

The first essential is the proper selection of soil. The kind of soil is not so important as the fact that it should be free from insect pests and reasonably free from weed seed. To this end, select a piece of ground that was in cultivated crop last year, and which received good attention. It should be reasonably level so as to retain its fertility, but it may slope in any direction, but an eastern or southern exposure will ripen the crop a few days earlier. If you have plenty of stable manure and can get it on the ground and turned under without making the setting of the plants too late, put it on. Should you not have enough manure to make a liberal application, put it on thinner so as to cover as much ground as possible, because stable manure is an excellent medium for the life of bacteria which render plant food available in the soil. Put a jointer on the plow and turn the manure under well.

It is well to remember that stable manure is organic fertilizer and, excepting that part which liquifies by means of soaking rains, it is not immediately available as plant food until the weather gets quite warm and decay sets in; until then it is too raw and indigestible for the use of the plant. But this difficulty can be easily overcome by the use of a high grade commercial fertilizer.—Green's Fruit Grower.

IRRIGATING SUGAR BEETS.

The U. S. Department of Agriculture, through the Irrigation Investigations, has recently issued a practical bulletin on Irrigation of Sugar Beets, by F. W. Roeding. It is compiled from data gathered from all parts of the West where sugar beets are grown, and describes in detail the preparation of the land, methods of irrigating, culture, crop rotation, cost, etc.

This bulletin is known as Farmers' Bulletin No. 392, and may be had free of charge upon application to the U. S. Irrigation Investigations, Berkeley, Cal., as the Department is anxious to place it in the hands of as many California irrigators as possible.

The success attained in the growing of sugar beets in Colorado, Utah, Idaho, and California, where the irrigation of beets is practiced, leads to the conclusion that large areas can be devoted to the culture of the sugar beet and that this industry will help greatly in the development of the immense tracts now being brought under irrigation. This development can be greatly promoted by the adoption of the best methods of applying water to the beet fields, and this bulletin is prepared for the purpose of supplying information as to these methods.

The Ornamental Garden

THIS MONTH.

THOSE who like large crysanthemum blooms should watch closely at this time. Suckers should be kept off and large side branches removed so as to leave only a limited number of buds. Of course many prefer the slender stalks with a larger number of flowers and are not particular as to size. These need not be so particular in the removal of side branches. The rose garden which is not in a prominent place may be deprived of the usual irrigation in order to force a heavy bloom later in the fall. Further treatment in order to secure these magnificent fall blooms will be given in the first issue in August.

The seed of eucalyptus and acacias and many other ornamental trees, may be sown this month. Owing to their rapid growth, it is yet a little early to start bluegums; they would become too large before time for planting in the open ground next spring, but varieties which are not so strong growing may now be put in seed-bed flats. Pansies and stocks for winter bloom may be sown; also sweet peas for the late flower season.

Later planted gladiolus are now in bloom, but the earlier have seeded and are anything but handsome with their dry stalks. The seed stalks should be cut off and the soil be allowed to dry somewhat so as to ripen the bulbs. These may be taken up the last of the month and stored for fall or early winter planting. Those which are still blooming should be given abundance of water. Shasta daisies likewise require a large amount of water if they are to be kept up to their finest bloom. To make long stems with large flowers requires plenty of water and a little fertilizer.

Bermuda grass is now spreading rapidly and should be raked with short rake and cut to prevent rooting in the lawn.

Callas and iris may be dug and sub-divided and planted in beds. Carnation and hydrangea cuttings may be made at this season or later. Partially ripened shoots are best for this. Amaryllis belladonna are now dormant but the time is approaching when they should be mulched and the soil kept fairly moist.

In California there seems to be little use for potted plants though more are used than formerly. This is a good season to consider the beauty of these plants and by cuttings or seeding plants provide for the future. A lath house is easy of construction and in it a few pots and hanging baskets may be filled so as to add a world of beauty to the porch. A bright colored geranium, common as it is, makes a handsome ornament when in bloom on porch rail or pedestal.

In the matter of irrigating the lawn and shrubbery, it must be borne in mind that it has been a long time since a heavy rain. This means a long distance down to permanent soil water. A light sprinkle does not begin to reach to this deeper moisture, and lack of thrift is manifested in the plants. It is a good plan to make a deep furrow around plants one wishes to especially favor, and let the hose trickle here for an hour or two and in some soils for several hours, and then deep culture with mulch later will do the rest.

GARDEN NOTES.

The grass should be kept neatly trimmed, whether the lawn be large or small. The lawn is more attractive if all shrubbery be planted at the side or in the rear.

The beauty of a place is enhanced if all fences are covered with vines. Or, if possible, replace the fences with hedges.

All unavoidable unsightly places, such as wood or barn lot or chicken yard should be screened by vines or shrubbery, burning bush being excellent for this purpose.

Before barns or other out-buildings trees make a beautiful screen.

Walks should be kept in repair and should be preferably of cement.

Waste papers should never be thrown outside, but should be burned. Tin cans and other refuse that cannot be burned should be kept in barrels and later hauled away. Nothing is so unsightly as a litter of tin cans in back yard or alley.

Wood ashes make an excellent fertilizer, and can be sifted on the lawn every few days. The grass receives the benefit and the back yard is spared the unsightly ash pile. All table and kitchen refuse, except what is fed to pigs or chickens, should be burned in the stove.

Special effort should be made to keep barns and outside closets in sanitary condition, as the deadly fly breeds in both places.

Alleys and streets should be kept clean and all weeds and grass cut several times during the season.

Curbings add to the appearance of the street and should be put in whereever possible.

Streets should be kept in better condition.

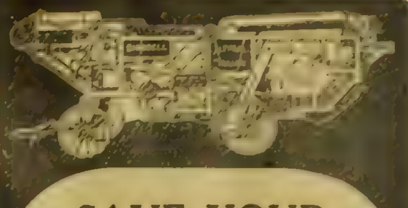
Never throw a paper, envelope or sack down when walking along the street. This should be impressed upon children.

Where fences have been removed, pedestrians should be careful to keep to the walk. Cutting across lawns or walking on grass plots between curb and walk makes unsightly paths that mar the beauty of well-kept lawns.—Coleman's Rural.

TO DESTROY CUTWORMS AROUND SWEET PEAS.

Make a rather strong suds with laundry-soap. Pour suds along row of peas, watch the ground closely while the suds soak in and you will be astonished to see how quickly the worms will come to the surface. Gather them into a small pan of the suds and they will soon die. Repeat this every morning or as often as you can and the worms will soon be destroyed. Soap-suds will not injure the sweet peas. Any suds left from the wash will do, providing no washing compound has been used in the water—Woman's Home Companion.

To preserve cut flowers, at the same time save changing the water, fill the vase two-thirds full of clean sand. Stick your roses or other flowers so they will remain just as you put them; then add water and see how much longer they will keep fresh. Sometimes the stems of roses and carnations will root in the sand.



SAVE YOUR ALFALFA SEED

We continue to warn Farmers that 25 per cent. of their Alfalfa Seed is wasted when the ordinary grain separator is used for threshing.

IT IS VALUABLE

Alfalfa Seed is being imported into this country every year because the Western Farmer does not produce enough seed to supply the demand. With the prevailing high prices of seed you cannot afford to have your seed wasted in threshing. We build the only machine in the world constructed especially for hulling Alfalfa Seed. If your thresherman does not have a "Birdsell" Alfalfa Huller give us his name and address and we will send him our Catalog and you shall have our 1910 and 1911 calendar in colors.

OUR ALFALFA BOOKLET—FREE

This booklet contains 48 pages and was written by an Alfalfa Specialist. If you are not raising Alfalfa send for this book. He tells you how to start a crop, raise and harvest it. Every man should have this booklet. Write today.

Drainage of the Sacramento.

This issue of the Cultivator gives attention to the great work contemplated in the lower Sacramento river. Those who have taken the steamship ride from San Francisco up either the Sacramento or San Joaquin have been impressed with the thousands upon thousands of acres of rich land useless because of the winter overflow. Some of these lands have been reclaimed, and in their reclamation the channels of the rivers have been narrowed until the overflow on other lands and upon the upper river sections has caused vast damage to fertile acres. The need of correcting these conditions has been appreciated for years, and the best engineers of the country have studied the problem. Some years ago it was suggested that the work be taken up by the government, but as the land in question had been transferred by the government to the state of California, it was felt by many that the state should shoulder the burden. A compromise has been finally effected whereby the preliminary work is to be joined in by both state and nation.

In addition to this initial work which is described and illustrated by maps, other projects are contemplated. One feature of the great Valley development is the Orland project in Glenn county; another is the Iron Canyon project which will give water to thousands of acres in the vicinity of Red Bluff. This latter is a second unit of the plan which was encouraged by former Secretary of the Interior Garfield. It was placed by Mr. Garfield on the waiting list and it was declared to be the purpose of the Service to take up the development as soon as funds became available. The preliminary work, however, has been discontinued by Secretary Ballinger. While there will be delays and possibly many years will elapse before this great work will be completed, it is started and means much for the welfare of our state.

Learning to Do Things.

A novel feature of college work is being carried on by the Department of Biology of Pomona College located at Claremont, Los Angeles county. This is not a part of the regular college course or rather gives no credit to the student carrying it, and being only a side issue, does not have general attention from the students, but those who have taken it—we note there are fourteen in the first year's course—are those who have felt the need of such training as is given by practical work in the breeding and care of plants. The college is in the center of one of the most highly developed horticultural regions, and yet in that section there is no other opportunity for training such as is offered by this department. The principal element in the course is the manual training which comes through the actual handling of the plants, mixing of soil, planting of seed, making of cuttings, resetting of young plants, grafting, and all kinds of practical work connected with plant life. We note one of the mottoes of the department as follows: "A man cannot most intelligently and efficiently direct others in any great industrial work, without understanding to a finish the basic scientific principles underlying that work, and without being able to do the things himself."

Recreation.

This is the season when a few people whose homes are in the country and nearly all people whose homes are in the city, take a few days off for a change of scene and for a rest to gather strength for the remainder of the year. We say a few of the rural people and many of the city people because, from our observation, such is the case. The farmer of today realizes more than the farmer of 25 years ago that the privileges and rights of the city people belong to him, but there are still many who believe that from 300 to 365 days in the year belong to the daily grind of farm work. Many such have little patience with vacations. This belief is so strongly intrenched that one of the great churches of this country has taken steps to impress upon the farmers the need of giving to their young people occasional rest days and holidays. Young people observe these privileges which are usually taken by city people, and that is one of the attractions which they look at when they think of city life. The farmer lives in the open air which is what the city people usually choose when they take their recreation. This makes some farmers think that they are having what the city people consider a vacation. This is true, but rest is not simply loafing and allowing the muscles to rest, but in its highest and best sense is securing a change of scene, and a mental simulus which will aid one to take up the ordinary daily labors with more vim and vigor.

California offers so many magnificent outing opportunities that the farmer should see that his family is given the privilege of their enjoyment. All will return more tired possibly than on leaving home, but with greater appreciation of the home life and a determination to do better work.

Twenty Millions for Reclamation.

The signing of the irrigation measure passed by the recently adjourned congress, which authorizes a $20,000,000 bond issue, funds from which are to be used in completing various reclamation schemes, will mean much to arid sections of the West. Those in charge of the Reclamation Service built large, and the fund from the sale of public lands which was to carry on the work was not up to expectations and was insufficient to carry out these great plans. It is fitting and exhibits good financial sense for the Service to complete this work. There has been complaint that some of the schemes have not worked out according to the dreams of those who planned them. This may be true. In fact, it would be marvelous if every dream of the bigger thinkers of the country should be realized to its fullest, but every industry the country over, manufacturing as well as agricultural, will be benefited by the development of these great stretches of arid land, and we hope continued extension of these systems will be maintained.

Eighteenth National Irrigation Congress.

The official call for the Eighteenth National Irrigation Congress announces that the meeting will be held in Pueblo, Colorado, September 26th to 30th, 1910. The call outlines the personnel of the attendants, number of delegates from different bodies, the program, scope of the National Irrigation Exposition held in connection, and general information. The program will include addresses by experts on irrigation and forestry, by foreign delegates, governors of states, industrial leaders, officials of large irrigation enterprises, and others. The exposition held in connection with the congress has much wider scope than any former exposition of the kind. There will be exhibited machines and devices for developing power used for irrigation and drainage, metho of transmission of power, all kinds of devices for raising water, distributing water and cultivating irrigated lands, plans and models of existing or contemplated irrigation or drainage systems, products of irrigated lands, and other exhibits interesting to irrigators. R. H. Faxon is secretary of the local board of control.

Lemon Freight Rate.

The fight before the Interstate Commerce Commission by lemon growers of California to retain the former dollar lemon rate, is succesful, and the decision of the commission sustains the contentions of the growers. It will be recalled that immediately after the increase of the lemon tariff by the Payne-Aldrich bill, the railways combined on an increase of the freight rate on lemons of fifteen cents per hundred pounds. This taking advantage of the tariff by the railways created indignation the country over and precipitated the fight which has just been won by the growers.

Two New Stars.

The forty-six stars in the American flag will be increased by two representing Arizona and New Mexico, on the flags floated above government buildings after July 4th, 1911, although it is possible that the convening of constitutional conventions and the adopting of constitutions satisfactory to the majority of the people, will delay actual statehood until 1912. The enactment which makes states of these two territories has been duly signed by President Taft, and the fight for statehood which has covered a period of years is now won.

The farm is the basis of all industry. For many years this country has made the mistake of unduly assisting manufacturing, commerce and other activities that center in the cities, at the expense of the farm.

Agricultural News Notes of the Pacific Coast

Northern California

Oroville's Water Carnival held last Friday and Saturday proved a complete success.

Ferndale is getting ready for the agricultural fair which will be held in September.

Bartlett pears are now going forward from many shiping points of the Sacramento Valley.

The first load of 1910 barley delivered to the warehouse at Gridley, Butte county, was on Saturday, June 11th.

The Department of Agriculture is spending from $15,000 to $20,000 per year on the plant introduction work at Chico.

The ferry service between Vina and Corning has become congested by the large amount of business and more complete service is demanded.

The Maywood Packing Co. at Corning, Tehama county, was unable to secure help to cut and dry all its apricots, and some were shipped to Red Bluff.

P. H. Dorset who was formerly connected with the government plant introduction garden at Chico, is giving a month's inspection to the work at the garden.

The fruit growers near Forestville, Sonoma county, recently met and made plans to enter a winning exhibit at the Apple Show to be held at Sebastopol in August.

Sacramento Valley Irrigation Co. has let the contract for the mammoth siphon which will conduct the irrigating water under Willow creek near Willows, Glenn county.

In spite of certain withdrawals from the fruit alliance of Eldorado county, the standardizing scheme is winning new friends there and the arrangement will be carried through.

A fruit growers association has been formed at Lincoln, Placer county, and the following are directors for the first year: A. Isaak, Fred Clark, S. W. Hinkley, F. H. Fowler and N. Labrie.

Dr. William H. Boynton, a veterinarian formerly with the University of California, has gone to the Philippines to find if possible a cure for rinderpest, a serious disease affecting cattle of the Islands.

The campaign against glanders at Anderson, Shasta county, has been most vigorous and it is now reported that the place is freed of any possibility of infection. All public watering troughs were disinfected and kept dry for two weeks.

The barley fields of Sutter county are turning out remarkably well this year, some showing as high as twenty sacks to the acre, ranging from that down to twelve sacks. Some exceptional lands along the river have yielded thirty sacks.

The government experiments in rice culture near Red Bluff, Tehama county, on land which is underlaid with hardpan, have proved the adaptability of the section to rice. Twenty-seven varieties have been planted and nearly all are making vigorous growth.

Central California

Santa Clara Valley apricots brought better prices in the Eastern markets than for years.

The Farmers Union of Santa Clara Valley is very active, and new members are being secured.

The raisin market has been somewhat stimulated by the injury to the crop caused by hot weather.

Turlock Melon Day is the latest festival announcement, and some day in August is to witness the feast.

The Santa Clara County Poultry and Pet Stock Association is planning big things for its fall show beginning October 4th.

Sunflower Creamery at Porterville paid for May 28 cents for butterfat, while for June the price ran close to 31 cents.

The horticultural commissioner of San Joaquin country has liberated a large number of parasites of the apricot brown scale.

The Fresno Republican estimates that the damage to growing grapes by the heat wave late in May will be at least ten per cent.

Recent heavy purchases in prunes have greatly reduced the holdover crop. It is reported that future California prunes are strong at 4¼ to 4½.

An orchardist at Porterville, Tulare county, claims he has the largest single irrigation plant in the state. It lifts sufficient water for 120 acres.

The Pajaronian estimates that Newton pippins will be full crop, bellflowers 15 per cent short, apricots half crop, cherries half crop, all berries big crop.

Owing to a break in the Turlock Irrigation District canals, $25,000 worth of repairs were necessary, and some farmers were without irrigating water for four weeks.

A fire started amongst the leaves in a field near Porterville in the hope of destroying a horde of grasshoppers, escaped from control and destroyed thousands of acres of pasture.

Stock growers of Stanislaus county report ravages of lung worm in young calves three to four weeks old. It has been especialy bad on calves pastured on marshy or swampy land.

A convention of California Mutual Fire Insurance Companies was recently held in San Jose. These companies, which are organized by farmers, are now carrying over $14,000,000 of insurance.

A tract of 22,000 acres west of the river and near Dos Palos, will be subdivided, irrigated and colonized by the same company which is handling the Kerman lands. The tract will be supplied from the canals of the San Joaquin and Kings River Canal and Irrigation Co.

A rancher at Terra Bella, Tulare county, has had excellent results in poisoning squirrels by use of small cans of water which are exposed for a number of days until the squirrels form the habit of coming to them to drink, then they are filled with poisoned liquid.

Southern California

Ventura county apricot dryers paid 12½ cents per box for pitting.

Coachella Valley has shipped between 40 and 50 cars of cantaloupes.

Ventura county dried apricots will be ready for packing about July 15th.

A Riverside alfalfa grower has just cut 76 tons of hay from one 40-acre field.

Some growers are manifesting faith by planting almonds in Coachella Valley.

The Yucaipe Valley is now harvesting a large quantity of red astrachan apples.

The biggest threshing machine in Ventura county has just been built at Oxnard.

The Colorado River was discharging at Yuma on June 18th 47,700 second-feet.

Elks from Ventura county will distribute 500 sacks of walnuts at the Detroit convention.

Hay balers are busy at Moorpark, Ventura county, and a big amount of hay is being put up.

The Hemet Cannery ran day and night on apricots, putting up nearly 10,000 quart cans daily.

The Imperial Valley may exhibit a car of its finest cotton at various southern state fairs this season.

With lemons selling in the eastern markets at $7.00 and $8.00 lemon growers are wearing a broad smile.

The Lompoc Valley, Ventura county, produces 90 per cent of the mustard consumed in the United States.

Irwindale, Los Angeles county, orange growers are discussing the formation of a new orange growers association.

The farmers club at Mound, Ventura county, is one of the live ones of the state and held an interesting meeting last week.

Some packing houses have been compelled to put Valencia oranges "through the sweat" in order to secure return of good color.

The first shipment of Malaga grapes from Coachella Valley this year was on June 17th, two days earlier than the first shipments of last year.

Articles of incorporation have been filed for the Call Lemon Association. The membership is composed of lemon growers at Corona, Riverside county.

County horticultural commissioner Wilsie of Imperial county is serving notices calling for the eradication of Johnson grass, wild asparagus, cockle bur, sunflower, dodder and morning glory.

The Imperial Valley water situation seems to be cleared somewhat by the action of Congress in granting to President Taft $1,000,000 with which to begin control measures for the Colorado river.

The Orange County Dried Fruit Association has determined to hold the bulk of its fruit at 11 cents, though members who may wish to sell at 10 cents per pound are permitted to sell at that price. The same association is hoping for a $30 price per ton on pits.

The Coast

Wool growers at Asotin, Washington, are holding at fifteen cents.

Farmers at Walla Walla, Washington, are losing much because of lack of labor.

Preparations are under way for the Cherry Fair to be held this month in Salem, Oregon.

Two hundred acres of unimproved land at La Grande, Oregon, recently sold for $20,500.

An exceedingly large pack of salmon will be made at the canneries at Astoria, Oregon.

A herder with a band of 2,000 sheep has been lost in the mountains near Trinidad, Washington.

The benefit of reforesting is beginning to be seen in some of the forests of Washington.

A careful canvass of the apple orchards in the Hood River section indicates a bumper crop.

Steady rains from the middle of last June were of great advantage to farmers in eastern Washington.

North Yakima, Washington, is now shipping thousands of pounds of large cherries to all sections of the East.

The fourth annual demonstration trip over the Northern Pacific left Pullman, Washington, July 5th.

Thirty thousand acres will be reclaimed at North Yakima by the drainage of the Yakima Indian Reservation.

Wool growers at Pendleton have in storage 500,000 pounds of wool. A little of the finest has been sold for 17⅛ cents.

Ranchers near Casa Grande, Arizona, are now running five gasoline traction plows and planting grain and sorghum at the rate of 40 acres per day.

A large tract of land is being reclaimed near Tucson, Arizona, by an immense pumping plant. Alfalfa and garden truck are to be the principal crops raised.

Farmers at Athena, Oregon, are making a united campaign on the "Jim Hill" mustard. It is feared this pest will take the grain fields of the state if not brought under control.

Walla Walla, Washington, has a well which is flowing with such strength that it throws an eight-inch column of water 112 feet into the air. The flow aggregates about 2,224 gallons a minute.

Farmers near Vancouver, Washington, are organizing to protect their lands from delinquent tax sales made before they acquired the land when they were the property of the Northern Pacific Railway.

The alfalfa growers of Yuma Valley, Arizona, have formed an association looking to the best interests of the alfalfa fields, the first move to be made toward the destroying of dodder which is infesting the fields.

A big irrigation scheme which has long lain dormant in the Methow-Columbia Valley section, has been revived and it is rumored capitalists will furnish funds to complete the canal which will reclaim about 11,000 acres.

Coulson's
EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying power and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

THE CHICK'S "LAYETTE."

By Mrs. Frank Metcalf.

WHEN a human baby is looked for what a dainty "layette" is made ready for its reception; softest of flannels, the daintiest of laces and embroideries are purchased and made up into the most fetching little garments for the rosy limbs of the darling to come, and every mother knows that even the very best does not seem half fine and soft enough for the tender blossom, so loved and so frail. Do we realize that we should give some of this care to the tender baby chicks our greed for gold brings, un-mothered, into this harsh, cold world? Sometimes we do, but often we seem indifferent to their most crying needs, and they suffer and die, simply for the want of just the simplest necessities, when a little forethought, might have given them comfort, and ourselves profit. O! the pity of the helpless little downy chicks, smothered in stuffy hot brooders, or shivering in cold and filthy, lice infested ones! What a cry of misery goes up from millions of these every year! Better never to have been hatched at all, than to be so tortured. If they cry and peep for a fresh drink or a crumb to stay their hunger, how often they are met with the impatient remark: "O! You little yelping torments, there, take that and shut up!" and a little sour dough, or stale water is carelessly thrown at them, and the door slammed without even looking to see whether a prowling cat or dog, or larger chick, crowd them away, or not. This way of caring (?) for chicks is all too common, and is one of the reasons so many declare that "chickens don't pay." They do if they have even half a chance, but cannot live and thrive upon even California air, without a little encouragement.

But this is not what I started out to write about, getting ready for the clutch to come from the incubator, in the hope that I might help some little chicks to a better time during their short lives. It doesn't take much to make a clutch of baby chicks comfortable and happy in this favored clime. Back east, where we have to guard against rains, hail and snow it is something of a task to get ready for a hatch of early chickens, but here, and now, at this time of the year especially, all we need to do is very simple. Suppose we expect 100 chicks. We may make us a long box with a lid hinged on, out of a packing case, maybe twenty inches or two feet wide, and at least six feet long, for every 50 chicks. Eighteen inches deep will do nicely, and a square may be cut out near the center of one side for a door, for which a wire screen door may be made on a frame, to open from the outside. Eight inches square is convenient, but a smaller one will do for a while, and a second opening cut for a window which may be used for a door later if one wishes.

Now, nail a strip of half-inch stuff, one inch wide and twenty-four inches long, six inches from the floor at each side of one end. For the hover, make a frame that will drop onto these cleats loosely, out of light lumber, say one inch stuff, and onto this frame tack a cloth with a pleat in each corner, so it will sag down in the center touching the chicks' backs. This cloth may be of almost anything, and I find the bottom parts of old outing flannel night dresses about as good as anything, as it is soft and sleazy, and allows the insect powder I like to use, to sift through nicely, being better than new material in this respect. A cushion of the same material may be loosely filled with straw for the covering, or old feathers may be used, not a thick, heavy pad, but just a soft, loose one, that will not weigh down on the tiny backs. A strip of the cloth should be left to hang down in front of the frame, and a good-sized crack left along the back for air as the cleats stop that up along the sides, unless a strip is hollowed out for that purpose before they are nailed on, which would be a good thing to do (by the way this strip makes such a fine hiding place for mites, that it should be hollowed out, by rights, so as to be more easily sprayed.) A board to fit up in front of the frame should be used for a week, so as to keep the chicks in at night, until they learn the way themselves. I prop this board up with a brick, usually, and leave it on a slant for them to run up and down on afterwards.

Now go to the barn and gather up the fine alfalfa leaves and put a layer all over the floor of your box about two inches deep, and make a flat nest of soft straw under the frame hover, hollowing it slightly in the middle, like a nest. Put in a drinking fountain (not in the nest, but in the box) which may be a pound baking powder can, with a nail hole or two near the edge, inverted over a tin lard pail lid, for the first few days. This should be set up a little, or they will scratch it full of chaff first thing. Take an old pie pan and fill it partly full of chick grit, or gravel, and sprinkle the feed used on this. I use cracked wheat, with a ground onion, hard boiled egg and dry bread mixture, as for turkeys, the first few days sometimes, and sometimes bird seed, with fresh green stuff like lettuce or Swiss chard in abundance always. The chicks are taken from the incubator when twenty-four hours old, in the heat of the day, and placed in the box where the sun can shine on the lid. This keeps them warm enough, as a rule, but if they seem chilly, I put them all into the straw nest and cover them snugly for a couple of hours, then let them out to eat again before nightfall.

A box like this will accommodate 50 chicks nicely, and for 100 two or three may be provided, as many maintain that 50 is too many to keep in one. Keep the chicks in the boxes for three or four days, then make a wire run for them so they may learn to go out and into their own box, and after they are three weeks old they will always come back to their own coop, no matter how far away they wander during the day. Soon we will find them roosting on the top of the hover, and then they may be either moved to larger coops, or the frames removed and small roosts put in place of them. I do not move them into larger coops until they are quite well feathered, and consider this the nicest and easiest way of raising chickens I have ever tried. Keep cracked wheat in the pie pans always and water in a shady nook near by.

Now, all the above applies to new brooders, but many times we have old ones on hand which we wish to use; in this case, we must proceed just as though that particular old brooder had been exposed to all the diseases that chicks fall heir to. Take a good big pan of wood ashes, if you have them, and throw into the floor of the old brooder, then pour on a kettle of boiling water and scrub, and scrub. Every crack and cranny must be cleaned, and then well rinsed out, after which it should be simply soaked in distillate, top, bottom and sides, outside as well as inside. This must be done a day or two before the chicks arrive, and it should be left open to the sun and air, meantime. It wouldn't hurt to just pour a little more distillate into the corners after it has gotten thoroughly dry, for luck. Now, proceed just as with a new brooder, but watch it a little closer for mites. If hens are used for brooding, clean the coops used for them exactly the same way and burn all straw nests, and soak the nest boxes between each hatch with distillate besides spraying the house where the hens set once a week, at the same time dusting the setters, of course covering, or removing them while the spraying is going on. To put a hen and chicks into a last year's coop without a thorough cleaning is to condemn the innocent chicks to a slow death of torture 99 times out of 100. Don't do it! Dust the hen when you take her off the nest, and grease the heads of the baby chicks and pick off the large gray lice you will surely find on most of them. Care for them kindly and lovingly, and they will pay.

POULTRY QUERIES.

Incubator Turks.

Several weeks ago Mrs. Metcalf told the readers of the Cultivator not to set turkey eggs in an incubator. I must give you my experience with the same in Antelope Valley. On May 6th of last year I bought 100 turkey eggs, which were transferred three times in shipping. I hatched in the Cyphers Incubator 70 per cent of them. This year I have purchased 50 breeding hens and from the first 173 eggs laid by them I hatched 155 good, strong poults, of which I have raised in the brooder to two months old 140. Have now 700 young turkeys and more than half were hatched by the incubator, I find it more successful here than by hen turkeys for they kill many of their young by stepping on them. I have also hatched 400 chicks and lost but six. I have not had any sickness nor mites amongst my fowls since coming here two years ago. The place is ideal for poultry and we have a good market, being near the gold mines. I trust this will help some one.—Alice E. Lynn, Rosamond.

Unfertile eggs are preferred for the kitchen because they are supposed to retain their freshness longer than fertile ones.

ARTIFICIALLY INCUBATING TURKEY AND DUCK EGGS.

I saw Mrs. Metcalf's article in the California Cultivator on artificially incubating turkey eggs, and while I did not follow her advice, about dipping the eggs, I will give my experience, as it may be beneficial to some one else. I was operating my machine at the time her article appeared, and it very much discouraged me, but as it was my first attempt I continued just the same as for chicken eggs. After testing out I had 61 turkey and 16 duck eggs, and I hatched 55 turkeys and 12 ducks. I am very well satisfied with the results.

Now I operated my machine exactly the same as for chicken eggs, only continued 28 days instead of stopping at 21. I do not know why so many make failures unless it is because they do not air the eggs enough. I am a great advocate of plenty of fresh air. I commence airing the eggs five minutes the fourth day of incubation and gradually increase to thirty-five minutes at the last of the hatch, that is the twenty-sixth day, as I did not turn them after that.

I use no moisture in my machine, I think there are more chicks drowned in the shell by too much moisture than die from lack of moisture. Where too much moisture is supplied the air space will be very small and the chicks die in the shell for want of room and air. If the air cell is watched in an egg that is incubating under a hen, it will be seen that about one-third of the egg is an air cell at the time of hatching. That is one thing I watch very closely, to be sure to have a good large air cell, and I turn the eggs carefully by hand so as not to jar and tear any of the minute blood vessels loose. It is a mistaken idea some people have that because a turkey egg is larger than a chicken egg it does not require as high a degree of heat to hatch it, but it takes 103 degrees, the same as for chicken eggs. I have never tried raising the little poults in brooders, but I think I shall next year. There is one thing sure, the turkey hens on this farm are going to lose some of the pleasure of breaking eggs and leaving their nests, as I shall use the wooden hen hereafter.—Mrs. G. W. Halstead, Visalia.

BREEDING UP.

Undoubtedly the poultry industry of the state will, at the next meeting of the legislature, receive an appropriation for the purpose of promoting it We hope this will be the case, and that a good share of this appropriation will be given to the poultry department of Iowa State College to be invested in stock of the best quality obtainable, from which eggs and stock will be sold to farmers at nominal prices. Unless the farmer is able to purchase stock which represents the best utility quality of the breed, he would better put enough into pure bred to furnish a thoroughly good pre-potent male, to be mated with eight to ten of his best females, rather than to buy a trio of birds whose only merit is that they have no alien blood. A good high-grade bird is better than a pure-bred cull. With from five to seven crosses of a pre-potent male bird of the same breed and variety on the best of the farm flock each year, we have a flock practically pure bred, a flock which will breed true to type, with more vigor than we would have had from a flock of cheap pure breds. It is most encouraging to have a flock improving with each generation, and to gradually grow into the pure-bred business is better than to jump into it with small working capital. In grading up, however, one must resolutely resist the temptation to use his own best males. Use the best pure-bred male you can possibly afford each season; the same bird should be vigorous enough to use two seasons if mated to vigorous hens. What we want on the farm is tested breeders. Our State College would do more to improve the quality of farm poultry by selling to the farmers birds kept through one breeding season, and known to be pre-potent along utility lines, than by sending out hundreds of bulletins. The value of any breed rests absolutely on its utility qualities; the fancier only takes up a breed when its value has been demonstrated as a producer.—Wallace's Farmer.

GARGLING A FOWL'S THROAT.

A subscriber wishes to know how to gargle a fowl's throat, having been told that a remedy for roup was to gargle the throat of the fowl with equal parts of peroxide of hydrogen and water. To "gargle a fowl's throat" for roup, inject either peroxide of hydrogen or kerosene into the nostrils with a medicine dropper and hold the throat so the bird is unable to swallow. Let the medicine remain in the throat long enough to penetrate, then turn the bird head down to throw out the wash.—Wallace's.

Concrete floors are not to be recommended for the poultry house unless they are covered to a depth of four to six inches with dry soil or sand. In the first place, they are cold in winter, and in the second place, a fowl flying from the roost and lighting on a hard concrete floor is liable to injure its feet and bumble-foot is almost sure to ensue. Even a board floor should be coyered with dirt or sand or deep litter.—Commercial Poultry.

People who use an incubator, says the Minnesota Experiment station, should not remove chicks from the machine until they are thoroughly dry. Colds at this time are likely to result in pneumonia and death. The brooder should be heated to ninety or a hundred degrees before the chicks are placed in it, and kept at about that temperature for a week at least, when the temperature may be gradually lowered to a degree that barely renders comfort.

Grain and other hard food may be scattered on the ground, but soft food should be given on boards, or better still, in troughs or vessels in which the fowls cannot place their feet, and which can be cleaned easily at frequent intervals.

See that each bird that is to be used in the breeding pens is in the best of health, with bright eye and red comb. It is a waste of time and effort to try to breed strong chicks from emaciated breeding stock.

Stuffing, poultrymen assert, never did make hens lay, as it makes them fat, and lazy birds never were noted for their laying qualities.

Big, heavy, slow-going hens ought not to be kept in the same pen with the quick, nervous ones. The hens that get around lively will eat the others out of house and home.

How Much Is Water Worth?

Water is very expensive if you are buying a disinfectant that is half water.

Coulson's CRESOLENE

is a powerful disinfectant and germicide made from coal tar. You add the water yourself to make the disinfectant desired strength. COULSON'S CRESOLENE must be diluted from 20 to 100 times its own bulk. It is not poisonous—more powerful than copperas, cloride of lime and other well-known disinfectants. It forms a milky emulsion that only costs 1 1-4 cents a gallon. It is the cheapest disinfectant on the market and at the same time the best. Use it on stock—poultry—dogs or as a general disinfectant and insecticide.

If your dealer does not keep it, order direct from us. Quart cans—50c. Gallon cans—$1.25. Freight free on gallon orders.

SACRAMENTO IMPROVEMENT.

(Continued from Page 3.)

Views Along the River

lands to the value of $75,018.50 have been bought and paid for. The city of Sacramento is expected to furnish the sum of $75,000, and it is understood that the Board of Trustees will submit a proposition for a bond issue of this amount.

The map on the cover shows in a very clear and effective manner the work to be performed with the million dollars which the engineers of the United States War Department expect to expend on the Sacramento river below Rio Vista. The map shows the present very narrow channel of the Sacramento river for about fifteen miles above its mouth, and the broad flood channel to be provided by the work contemplated. It shows also the broader channel of the San Joaquin river, and affords a comparison that demonstrates the inadequate width of the present channel of the Sacramento.

The map shows three streams converging above Rio Vista. These are the Sacramento (old river), Steamboat slough and Cache slough. The two stream first named are channels of the main Sacramento river; the third is the outlet of the Yolo Basin, through which passes the greater part of the flood water originating above the mouth of the American river. These deliver into the single channel at Rio Vista all of the waters of the Sacramento river system. A simple comparison of their combined channel width with the channel width below that point, as shown by the map, is sufficient to demonstrate the necessity of the work now proposed.

The utter inadequacy of the present channel below Cache slough is perhaps most conclusively shown by a comparison of the actual flood capacity with the volume of water to be handled in this portion of the river. The present capacity, upon the basis of the flood of 1909, is 165,000 cubic feet per second. The Debris Commission estimates that had the waters of this flood been confined above, the flow would have exceeded 500,000 cubic feet per second. In other words, the flood of 1909, if confined to channels above Rio Vista, would have necessitated a channel three times larger than that now existing below that point.

Obviously, an enlarged outlet channel must be provided before the river above Rio Vista can be successfully controlled.

A progressive improvement of the entire river looking to ultimate complete control of flood stages is the aim of the engineers of the War Department, who have proposed this as the initial unit. This greater project, plans and estimates for which are now nearing completion, will be recommended to the Chief of Engineers about July 15th next. It contemplates the ultimate enlargement of the river below Cache slough to care for a maximum discharge of 600,000 cubic feet per second. The river from Cache slough to the mouth of the Feather will be enlarged to carry 100,000 cubic feet per second. All flood waters above the American River will be carried through a by-pass in Yolo Basin, thereby enabling the Sacramento to carry with safety the floods of the American river.

This great project is the final result of studies of the Sacramento river problem extending over a long period of years. Since the great floods of March, 1907, and January, 1909, the best authorities have agreed that a by-pass channel through the Yolo Basin must be a part of any effective river control project that is practically feasible.

It may be that some will still believe that the channel of the river proper should be enlarged to carry the floods and a by-pass channel eliminated from the plan. Any controversy on this point would affect in no way the project for the widening of the river's mouth, for, whatever may be the means employed to carry the flood waters to Rio Vista, an enlarged channel capacity must be provided below that point.

The American river at maximum flood, delivers into the Sacramento more water than the Sacramento channel below Sacramento will carry in its present condition. The American river at high flood has carried 120,000 second feet for a period of one day, and the flood capacity of the Sacramento river below this city is only 80,000 cubic feet per second. It is evident, therefore, that before the flood waters of the American river can be passed through the Sacramento to Suisun bay one of two things must be done: The levees must be raised or the channel enlarged.

Under the present conditions the surplus waters of the American at high flood, flow into the American and Yolo Basins. The reclamation of these basins will add hundreds of millions of dollars to the wealth of the territory immediately tributary to the city of Sacramento. Such reclamation will render it necessary that adequate provision be made for taking care of the American river flood, and this river widening project offers the most natural and the most economical method of proceeding to do it.

As already explained, it is the intention to follow the Rio Vista improvement with a progressive upstream development of the channel, designed to solve the problem of the American river flood.

The work to be performed on the lower river is designed to increase the flood capacity three and one-half times. The present channel, which carries at high flood 165,000 second feet, is to be enlarged ultimately to carry 600,000 second feet. It is not the intention to provide the maximum channel at this time; necessary lands will be acquired and the levees moved back, and critical points will be dredged to an extent that will afford an immediate increase in flood discharge to about 250,000 second feet with a flood level at Rio Vista about two feet below that of January, 1909. Further flood capacity will be provided by dredging as the progress on improvements to the river above may require.

The present channel below Cache slough has a width at the narrowest places of from 700 to 800 feet. Bakers Point, where a part of Sherman Island projects into the stream, is the critical point, the distance between levees at this place being only about 700 feet. This projection is to be cut off, the levees moved back. This and similar treatment at other points, will correct the alignment and increase the width. The channel to be formed will have a uniform width from Cache slough to Suisun bay of about 3,000 feet; when fully developed by dredging, it will have at flood stage a uniform depth of about 35 feet.—Great West.

The co-operative winery at Lodi will be enlarged this year at an expense of over $5,000.

"Beats 'Em All for Making Money"

"I have run.................... and many other machines, but the **Wolverine** beats them all for making money. I have put 216 pounds of dry straw in a bale and 175 pounds of hay." (Abstract from letter received. Name and address of party furnished on request.)

From "stem to stern" the **Wolverine Hay Press** is RIGHT. There isn't a dishonest or careless spot in its whole make-up. We have the biggest plant in the country devoted exclusively to making Hay Presses. The **Wolverine** has made an enviable reputation—and it is **maintaining** that reputation and increasing its facilities every year to take care of the growing demand.

A smooth, even, heavy bale comes from the **Wolverine Hay Press.** It is a fact that dealers will often pay more for hay put up in nice bales. It eats hay as fast as it can be handled by four men in a mow. It can be **depended upon** to work every hour in the day without a repair man constantly "tinkering" around. It is built for hard, long service.

Wolverine Hay Press

WOLVERINE CONSTRUCTION DEFIES DESTRUCTION

The Wolverine is built both with steel and wood frames, four different sizes, all with double gears, with various equipments to suit the requirements of purchasers. It isn't the cheapest Hay Press made, if first cost is considered, but it is the **cheapest baler** in the long run because there is an absence of repair bills.

Bees and Their Care

LESSONS IN BEE-KEEPING FOR BEGINNERS.

By J. G. Gilstrap, Inspector of Apiaries, Stanislaus County.

Second Article.

I IMAGINE the occasional farmer who may have tried some of the hints which appeared in the Cultivator of June 16th, may have decided opinions as to the kind intentions of the bees he has been working with. I imagine some may be saying: "Those bees are the crossest creatures I ever saw. They seem to be busy but I can't fool around them much. Sting? Well, yes. They are as vicious as the old colony they came from over there in that old barrel. That barrel has had bees in it for well nigh five years, but I thought when the bees got in a new movable frame hive they would not be so cross. Are all bees that cross?"

Now, there is a great difference in bees, as there is in chickens, cattle, or even people. The beginner will notice that his bees which have been so active in defending their own hives, are usually dark and rather small. They are more irritable than many other varieties except possibly Cyprians. The gentlest bees to handle are the Italians. Of these there are three distinct strains; the golden which are very yellow, the three banded, and the leather colored. Each strain has its advocates, but in my experience I find little difference. There are many varieties, which I will not now consider.

As to bees which have been kept in an old barrel or makeshift hive, I will say that they should be transferred to a regular frame hive and be re-queened. This will make them more gentle and far better workers and in such condition that you may expect a fair margin of profit if well cared for.

To Transfer.

There are two general plans of transferring, but of course circumstances will govern the details of working them out. Procure a good movable frame hive and have it ready for the first pleasant warm day when the wind is not blowing. Bees are less liable to be cross on such a day. Remove old barrel or makeshift hive from its stand and place the new one on stand. Before beginning work with the bees, smoke gently to keep them quiet. Now open the hive or box at the top and blow smoke freely from above. Continue until bees have been largely driven out of hive, and scrape and brush in the top of the new hive or in front of it. The frames may be lifted out of the new so as to attach the old comb to them. Now lay the lid or cover on the new hive and remove side of old hive or barrel so as to expose comb. Then cut out combs carefully, one at a time, and lay on smooth board, laying frame over combs to measure, cutting so as to fit frames, using only straight worker comb. Do not use drone comb which will be readily distinguished by the cells being much larger than that of the worker comb—we will in future paper speak more particularly about drones and drone comb. Also use care in transferring these combs, that very little honey is transferred. I usually put all or nearly all honey in a vessel to be taken away—always bearing in mind that transferring should only be done when there is a fair honey flow.

When the comb is cut so as to fit the frames it may be temporarily held in place by coarse thread or even wrapping twine wrapped around the comb and frame several times. Then lift the frame with comb suspended in it and put in place in the new hive. Continue this until the good comb has been used, filling each frame neatly. Be sure not to leave scraps and waste honey lying around.

The other plan which will give two swarms is to drive out bees with smoke as above until they are well out of old box. But few need remain, and after getting them into the new hive carry old hive away and close all exits except room for about two bees at one time. Everything working favorably, the young bees in the hive may be transferred later when all old brood is hatched and the young queen they are supposed to be raising is laying usually in about three weeks.

Again, you may remove the bottom board from the old box hive when you have the bees all drummed out into the new. Use queen excluding zinc on the top of the new hive, closely fit and set old box with combs and brood on this zinc. The queen is now held below and the brood will be better hatched. In either case, I would advise placing one or two frames of brood in the new hive. If you have succeeded in getting the queen into the new hive, the swarm will almost surely remain though sometimes they will leave.

Arrange to have the new hive in partial shade, with little sun. It is also most desirable that this work be done when there is a honey flow.

Introducing New Queen.

Some difficulty may attend your efforts to make two swarms out of one, especially if the bees in the old hive have lately swarmed. In that case, the number of bees is small, and of course there is a bare possibility that they have not raised their young queen, or she may have been lost in the mating. If you have transferred the bees according to the second plan and wish to re-queen with Italian, proceed as follows:

About seven to ten days after driving bees out of old hive, introduce the young queen by releasing in the entrance of the old hive, following her with a little smoke for a few minutes, which plan very seldom fails, or if preferred you may place the usual mailing cage, after removing the perforated metal at the end, in such a way between the combs or frames at top of hive, that the bees in the hive will remove the "good candy" and release the queen—usually in one to three days.

If your queen is not in a mailing cage, you may cut a piece of wire screen four inches square, ravel out wires from all four sides three-fourths inch or a little over, turn these raveled ends all down in such manner as to form a box or lid. Select a frame or comb of sealed brood with a little honey. Turn this screen cap over your new queen, sealed brood and a little honey, and gently press the protruding ends of the screen wire into the comb, just leaving free room for the queen and hatching bees to crawl around under the screen.

(Continued on Page 23.)

The Luitwieler Non-Pulsating Pumping System

BEST FOR DEEP WELLS AND IRRIGATION WORK

Operate with Less Power, Less Atttention and Fewer Repairs than any other method

The cut shown is the Luitwieler Heart-shaped Cam, and the only reciprocating pumping mechanism with uniform application of power throughout the full stroke and uniform speed of the water pistons or plungers.

This enables successful direct geared drive, which we furnish, and particularly, our self-contained electric pumps fill a long-felt want.

We also furnish direct geared steam and distillate drive when desired.

The uniform application of power also insures long life of working parts; freedom from break-downs; continuous flow; no jar; no noise; no pit; no bother.

Pumping against a steady pressure:

Thirty-two years experience in Los Angeles with pumps and irrigation.

Is the title of a booklet (briefly put) that I have written and just published. If, in the past, your hens have not laid well during the winter time, when prices of eggs were high, and you can welcome bona-fide, practical information and instructions that will tell you honestly just how to feed and care for your hens at less expense, that will positively induce them to lay eggs during the winter months, send One Dollar P. O. Money Order to me and I will mail to you, postpaid, one copy of the above mentioned booklet. L. D. HADLEY, 123 South Los Angeles St., Los Angeles, Cal.

HOW TO MAKE MONEY—MRS. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1.00. Address Mrs. A. Basley, Box 77, Venice, Cal. Send postal.

SEND US ADDRESSES OF 5 PERsons who have fowls and we will send you, postpaid, our Biddy Booklet and an Anchor Egg Separator. And if you will send us 20 addresses we will also send, postpaid, the Poultry Manual, a book well worth 50 cents. WEST COAST MILL, office 115 Winston St., Los Angeles, Cal.

POULTRY WANTED—WE PAY THE highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. ALLAWAY & LAYTON CO., 607 E. 3rd St., Los Angeles, Cal.

BUFF ORPINGTONS AND BUFF MINorcas, males. Buckeye (Reds). both male and female. Cheap if taken at once. Must have room. Wanted, a few S. C. Buff Minorca pullets. MRS. A. V. COX, San Luis Obispo, Cal. Lock Box 302.

FOR SALE—PURE BRED BARRED Plymouth Rock chickens. Crane and McClanahan strains. March hatch. $10.00 a dozen, $1.00 each. Mated pens. MINNEWAWA VINEYARD, Fresno, Cal.

LOVELL'S BLACK MINORCAS
California's
greatest egg producers
Pedigreed, trapnested, scientifically bred. Free circular. DAVID J. LOVELL, 5720 So. Park Ave., Los Angeles, Cal.

BONNELL'S S. C. BLACK MINORCAS win every time, the best that can be secured at any price. Eggs reduced to $1.50 per setting. A few cockerels for sale. C. C. BONNELL, State Vice President American Black Minorca Club, 2919 Brighton Ave., Los Angeles.

EGGS FOR HATCHING—BLACK MINorcas, Barred Plymouth Rocks, and Rhode Island Reds, $1.00 per 15, $5.00 per 100. L. W. NEILSEN, R. R. 2, Petaluma, Cal.

FOR SALE—50 TOULOUSE GEESE, four months old, from my prize stock. $2.00 apiece. E. WISEMAN, West Ocean Ave., Long Beach, Cal.

FOR SALE—EGGS FOR HATCHING from thoroughbred Mammoth Pekin and Indian Runner ducks, 75c per 12. $5.00 per 100. A. E. NELSON, El Monte, Cal.

THEY LAY AND WIN. ROSE COMB Black Minorcas. ELEANORE MINORCA FARM, Route 1, Los Angeles, Cal. Stock for sale.

BLACK MINORCAS OF QUALITY—Eggs $5.00 per 100. Ask for club catalog. S. D. BICKFORD, Gardena, Cal.

RABBITS.

FOR SALE—EUREKA RABBIT WARren Co., 928 Valverde St., Los Angeles, Cal., Wright and King, props. 150 fine bred New Zealand hares and 200 fine bred Belgian brood does and stud bucks from $1.00 up. Your correspondence is solicited.

FARM LANDS FOR SALE.

FOR SALE—815 ACRES IN SAN LUIS Obispo County. A typical dairy ranch. Plenty of wood, water, irrigable land, buildings, fenced and cross fenced. Orchards, vineyards, oranges, lemons and walnuts do exceedingly well here. 40 acres of land suitable for these. Price $21 per acre. For further particulars apply to MRS. F. A. CLINK, Pozo, Cal.

2285 ACRES CHOICE, DEEP, SANDY loam. Ideal for subdivision or Eucalyptus growing. Can be cultivated any day in the year. Southern Pacific Railroad runs through the ranch. Also close to deep water for shipping. Free from wind and frost. Now all planted to grain. Price $100,000.00 for limited time. GEO. W. SILL & CO., Watsonville, Cal.

FOR SALE—BEST POULTRY AND dairy 20-acre ranch, 6 miles west of Fresno. New cottage, fine water, best soil, turkeys, chickens, geese, ducks, pigeons, Berkshire pigs, fenced; flag station; healthy location for nice home; money-maker; terms. SMITH DAIRY RANCH, R. F. D. No. 3, Box 47, Fresno, Cal.

ORANGE GROVES—ALL SORTS, AGES, conditions and prices. Groves in best districts. Six year's experience. References all banks in Claremont and Pomona. A. W. RICHARDS, Claremont, Cal.

APPLE ORCHARDS, LARGE AND small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. GEO. W. SILL & CO., Watsonville, Cal.

FOR SALE—EL CAJON GRANT LAND. In the heart of El Cajon Valley, 80 acres of choice vineyard, large house, cottage and barn; trays, boxes, etc. Close to proposed electric line. S. B. HAWLEY, 1548 D. St., San Diego, Cal.

$2.25 PER ACRE BUYS LAND IN IMperial Valley (some of which is near Cawston Ostrich Farm), San Jacinto, Hemet and Antelope Valley. Have several good sections can sell for above price. E. WISEMAN, West Ocean Ave., Long Beach. Mention Cultivator.

FOR SALE—PERRIS VALLEY, 640 acres choice alfalfa land, close to railroad, water guaranteed, $50, big snap. STACY REALTY CO., 531 So. Spring St., Los Angeles, Cal., F 2115; or Stacy-Wagner Co., Riverside.

FOR SALE—$5000, 25 ACRES CORN, alfalfa, or fruit land. House, barn, chicken house, windmill and tank. Address W. J. COLE, R. F. D. 1, Box 25, Anaheim, Cal.

FOR EXCHANGE.

FOR EXCHANGE—I CAN EXCHANGE your ranch for good Los Angeles property. Send description and see HERBERT F. CLARK, 731 H. W. Hellman Bldg., Los Angeles.

MISCELLANEOUS.

HAVING OPENED A DAIRY SUPPLY house, would be glad to see all my friends and former customers. When in need of dairy supplies, milk coolers, cream separators, milk cans, milk bottles, etc., write or call GUY F. KELSEY, 108 East 8th St., Los Angeles.

FOR SALE—1160 FEET SURFACE IRrigating pipe, 8 in., good as new, $150, f. o. b. Richfield or Anaheim. Address J. L. DAVEE, Olive, Orange Co., Cal.

LIVE STOCK.

BERKSHIRE HOGS — POPULAR strains. Pigs. Young brood sows bred to Kingsclere Duke 3rd 111812. G. B. REEVES, Mountain View, Cal.

REGISTERED SHORTHORN BULLS and Poland China Hogs for sale. Best breeding. P. H. MURPHY, Perkins, Cal.

RARE PLANTS.

WILD PLANT IMPROVEMENT GARdens, Santa Ana, California. NEWTON B. PIERCE, Proprietor. Rare choice ornamentals and new fruits from all lands.

PIONEER ROOFING FOR SCHOOL BUILDINGS.

The "Manual Training Schools"—a group of five buildings—located on Vermont Avenue, between 42nd and 43rd Streets, Los Angeles, are being covered with Pioneer Specification Roofing.

The Hollywood Union High School buildings are also being covered with the same material. The Manual Training Schools require 100,000 square feet of Roofing, and the Hollywood Union High School, 40,000 square feet.

Pioneer Roofing is manufactured by the Pioneer Paper Company of Los Angeles, California. Roofing Booklet and samples of Roofing, will be sent by the Company upon request.

DIVIDEND NOTICE. THE SAVINGS AND LOAN SOCIETY.

(Member Associated Savings Banks of San Francisco.)

101 Montgomery St., Cor. Sutter St.,
San Francisco.

For the half year ending June 30th, 1910, a dividend has been declared at the rate of four (4) per cent per annum on all deposits, free of taxes, payable on and after Friday, July 1st, 1910.

Dividends not drawn become part of deposit accounts and earn dividends from July 1st.

Money deposited on or before July 11th will earn interest from July 1st.

WM. A. BOSTON, Cashier.

For Work or Play

The backbone of our business is the manufacturing of Tents, Awnings, Irrigation Hose, and of heavy canvas construction in general. However, we serve the public in many ways: We supply you with hunting, fishing and camping goods, with outing apparel, storm clothing, sweaters, bathing suits, with flags, bicycles and kodaks.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Pruning Orange Trees.

Will it be injurious to prune orange trees seven years old at this time or two months later? They have been somewhat neglected and have some suckers and smaller branches near the ground which should be removed. —Subscriber, San Bernardino.

We would not wait two months to do this work, but remove suckers and any dead wood and projecting or useless branches at once. The sap of the summer flow which is strongest at this period of the year should be diverted into fruit bearing wood. Every day of a sucker's growth at this season takes from the vitality of the tree. In addition, some young fruit will be removed by cutting off side branches, and these should be taken off before they have acquired size.

Sub-irrigation.

How can I use porous drain tile for sub-irrigation? Wish to use them in strawberry patch. Would like to conduct from 200 to 300 feet. The fall is from ten to twenty feet. Will the water escape from the lower end? How much does it cost per acre? Is cement good?—Subscriber, Arroyo Grande.

We do not know of any successfully sub-irrigated orchards or gardens in California. Many attempts have been made and abandoned. The expense is very heavy, ranging well up to $300 per acre, and the life of the plant has always been exceedingly short. The trouble is caused by the filling of pipes or tile with rootlets of the growing plants. It would probably be longer lived where annual crops are grown, but with trees, two or three years sees its finish. We do not think our subscriber will be able to make it work, but if any others have had successful experience, we will be glad to hear from them through the Cultivator. Presumably the lower end will be closed so there can be no waste there.

Warts on Udder.

Can some reader tell me how to remove warts from udder and teats of cow and not diminish flow of milk?—I. D., Sultana.

The simplest remedy we have seen was given by Mrs. Sherman in a former Cultivator as follows:

"Use cold-pressed castor oil on the warts night and morning after milking. If there are some that hang by a small neck that can be clipped with sharp scissors, cut them off, one each day on each teat and touch the spot with lunar caustic."

Flavor in Pork.

We have pork which tastes of the barrel. The brine has been changed but does not seem to help. Meat is solid and of fine appearance. What will take out the undesirable flavor? —Subscriber, Conejo.

The query is of the class which only those who have had experience can answer. We would suggest as a preventive of a similar result with the next batch of pork that the barrels be thoroughly scalded out with live steam or with boiling lime water. Of course care should be taken to select a barrel which has not been used for substances which will impart flavor to the pork. The only remedy we can suggest is the possible help of soaking the pork for a short time in boiling water before using.

Winter Rhubarb.

If I. L. S., Porterville, will write giving us full name, we will be glad to mail the information asked. We cannot answer anonymous communications.

On Shares.

I rent a piece of land to renter who agrees to sow, cut, and haul four-fifths crop. I agree to haul my share and help him haul his. I am to have the pasture. The place is partly fenced. Who should herd the stock off it?—Subscriber, Hemet.

If the subscriber means estray stock which may roam upon the land, would advise him that the state law prohibits ranging of stock, and it will not be necessary for anyone to herd stock off the growing crop, but ask the proper authorities to care for it.

What To Plant.

My brother and I are new in California and wish to know what to plant at this time to mature for feed for man and beast.—J. E., Perris.

The garden page of this week's issue of the Cultivator will give an idea as to garden calendar. For stock feed it will be hard to say not knowing kind of soil or whether or not irrigation is possible. Sorghums pumpkins, or even Indian corn, beets, or other crops will be possible. If you can irrigate, run water enough to thoroughly soak the land, then give cultivation, and it is likely that one irrigation will be sufficient for pumpkins or sorghum. However, far better results will be secured by future irrigations.

Jimson Weed.

A subscriber has written to us asking as to any possible disposal of jimson weed for drug production. We know of no market for it, and ask subscribers who may have had experience to inform us.

Pruning Logans.

My loganberries are done fruiting. I will cut out the old canes. What shall I do with the long new canes? Vines are on a low trellis.—H. R. T., Pasadena.

One method would be to allow the new canes to grow as long as they will by the end of the season and in January cut them back to about a length equal to the distance apart between the plants. That is if the plants are six feet apart in the row, cut the canes back to six feet in length. Another method that will give more fruit bearing wood, is to cut them back as mentioned above, about the middle of July, which will cause them to throw out laterals which should be allowed to grow at will until fall. In January cut these laterals back to about twelve inches. The fruit will be borne upon these laterals next season.—Q. A. L.

Pear Scab.

Am sending badly scarred pears. Can anything be done to prevent further damage, or may damage already done be remedied? Will it affect price? Will canners buy such fruit?—Subscriber, San Francisco.

This was referred to the Pathological Laboratory and Mr. Clayton O. Smith writes: "This is a case of pear scab. See Bulletin No. 163, California Experiment Station.

The remedy for this disease is spraying with Bordeaux mixture, 5-7-50. The work to be most effective should be done before the individual flowers can be detected, but while the buds are unfolding. Two sprayings at this time, about 10 days apart, give very satisfactory results."

The fruit will certainly not be as saleable as the fair fruit.

Poultry in California
Written by Geo. H. Lee

I have traveled in every state in the Union, in Canada and Mexico, studying poultry raising, observing local conditions involving success or failure. No one section has every advantage, none is handicapped by inevitable failure; yet, taking it all in all, there is no spot on the western hemisphere so especially and generally favored as Southern and Central California for success with poultry.

I have been at it for twenty-five years as a breeder; as a manufacturer fifteen years, and for easy money in poultry culture this section is a top-notcher. Not for the invalid transient who expects a comfortable livelihood from a few chickens without work; not for the inexperienced city dweller, operating a country ranch with incompetent help, but for the lover of poultry, who uses his head and his hands, there is no possible failure.

Always a good market and high prices, with demand always exceeding the supply; with a superb climate and all-the-year-round natural breeding season; no wintry blasts to devitalize the stock and curtail the egg yield; with no vermin that cannot easily be kept under control; all that is needed for success is proper stock, houses, food and utensils, a few simple rules for guidance and a lot of good horse sense.

I think so much of California and of its future as a poultry state that I have just opened at Los Angeles a branch of our Omaha house and before fall will establish also a factory for the manufacture of Mandy Lee Incubators and Brooders, now sold all over the world. Later I expect to make it my permanent home.

Anyone calling at our Los Angeles office will receive courteous treatment and gratuitous advice on poultry subjects. Ask for card entitled "Pointers for Californians." Also free poultry books.

Geo. H. Lee Company

Makers of Lee's Lice Killer, Lee's Egg Maker, Germozone, etc. Also Mandy Lee Incubators and Brooders, the kind that makes not only the biggest hatches, but brings the healthiest, hardiest chicks.

The Tee Irrigating Valve

Simple in design and construction, costs less and will last longer than any other on the market.

The Tee Irrigating Valve is made of an ordinary malleable iron T with a brass plug. It is designed for those who want an inexpensive irrigating valve, especially where such valves are needed in large quantities. There is nothing to get out of order. It is so simple you will wonder why it was never thought of before.

A ½-inch valve sent post paid upon receipt of 40 cents. Quantity price, circular and full information upon request.

THE RURAL TELEPHONE.

The neighborhood not far from here,
Put in a telephone last year;
Farmers built a rural line.
Instruments all "talked up" fine
All you had to do was ring,
Every bell went ting-a-ling;
One for Swanson, two for Boggs,
Long and a short for Mrs. Scroggs,
Every neighbor had his call,
Twist the crank and that was all.
Mighty nice when work was through,
To gossip for an hour or two
With your neighbors, one by one.
Somehow in a week or two
Troubles dark began to brew.
Farmer Jones got fighting hot,
Heard Scroggs calling him a sot;
Scroggs also got angry, too,
Heard Smith telling what he knew.
Smith heard Jonson telling lies,
Paid him off with two black eyes;
Johnson heard young Ezra Boggs
Underbid him on his hogs;
Every time the signal rang
To the 'phone each farmer sprang.
Slyly grinned and softly took
The receiver from the hook;
Boggs overheard a sneaking churl
Making love to his best girl.
Women, too, were in the muss,
Raised a most tremendous fuss.
Everyone from Scroggs to Jones
In glass houses throwing stones.
Now the line has silent grown,
Wires rusted, poles o'erthrown.
Twenty friends are deadly foes,
Each one full of griefs and woes,
Each too mad to speak a word,
'Cause the things they overheard.

—Chicago Inter Ocean.

THE NOTORIOUS JUMPING FROG OF CALAVERAS COUNTY.

IN compliance with the request of a friend of mine, who wrote me from the East, I called on good-natured, garrulous old Simon Wheeler, and inquired after my friend's friend, Leonidas W. Smiley, as requested to do, and I hereunto append the result. I have a lurking suspicion that Leonidas W. Smiley is a myth; that my friend never knew such a personage; and that he only conjectured that if I asked old Wheeler about him it would remind him of his infamous Jim Smiley, and he would go to work and bore me to death with some exasperating reminiscence of him as long and as tedious as it should be useless to me. If that was the design, it succeeded.

I found Simon Wheeler dozing comfortably by the barroom stove of the dilapidated tavern in the decayed mining camp of Angels, and I noticed that he was fat and bald-headed, and had an expression of winning gentleness and simplicity upon his tranquil countenance. He roused up and gave me "Good Day." I told him a friend of mine had commissioned me to make some inquiries about a cherished companion of his boyhood, named Leonidas W. Smiley—Rev. Leonidas W. Smiley—a young minister of the gospel, who he had heard was at one time a resident of Angels Camp. I added that if Mr. Wheeler could tell me anything about this Rev. Leonidas W. Smiley, I would feel under many obligations to him.

Simon Wheeler backed me into a corner and blockaded me there with his chair, and then sat down and reeled off the monotonous narrative which follows this paragraph. He never smiled, he never frowned, he never changed his voice from the gentle-flowing key to which he tuned his initial sentence, he never betrayed the slightest suspicion of enthusiasm; but all through the interminable narrative there ran a vein of impressive earnestness and sincerity which showed me plainly that, so far from his imagining that there was anything ridiculous or funny about his story, he regarded it as a really important matter, and admired its two heroes as men of transcendent genius in finesse. I let him go on in his own way, and never interrupted him once.

"Rev. Leonidas W.—H'm, Reverend Le—well, there was a feller here once by the name of Jim Smiley, in the winter of '49, or maybe it was the spring of '50—I don't recollect exactly, somehow, though what makes me think it was one or the other, is because I remember the big flume warn't finished when he first come to the camp; but, anyway, he was the curiousest man about, always betting on anything that turned up you ever see, if he could get anybody to bet on the other side; and if he couldn't, he'd change sides. Anyway that suited the other side would suit him—any way, just so's he got a bet, he was satisfied. But still he was lucky, uncommon lucky; he most always come out winner. He was always ready, and laying for a chance; there couldn't be no solit'ry thing mentioned but that feller'd offer to bet on it, and take ary side you please, as I was just telling you. If there was a horse-race, you'd find him flush or you'd find him busted at the end of it; if there was a dog-fight, he'd bet on it; if there was a cat-fight, he'd bet on it; if there was a chicken fight, he'd bet on it; why, if there was two birds setting on a fence, he would bet you which one would fly first; or if there was a camp-meeting, he would be there reg'lar to bet on Parson Walker, which he judged to be the best exhorter about here; and so he was, too, and a good man. If he even seen a straddle-bug start to go anywhere, he would bet you how long it would take him to get to—to wherever he was going; and if you took him up, he would foller that straddle-bug to Mexico, but what he would find out where he was bound for, and how long he was on the road. Lots of the boys here has seen that Smiley, and can tell you about him. Why, it never made no difference to him—he'd bet anything—the dangdest feller. Parson Walker's wife laid very sick once for a good while, and it seemed as if they warn't going to save her; but one morning he come in, and Smiley up and asked him how she was, and he said she was consider'ble better—thank the Lord for his inf'nite mercy!—and coming on so smart that with the blessing of Prov'dence, she'd get well yet; and Smiley, before he thought, says, 'Well, I'll resk two-and-a-half she don't, anyway.'

"This-yer Smiley had a mare—the boys called her the fifteen-minute nag, but that was only in fun, you know, because of course she was faster than that—and he used to win money on that horse, for all she was so slow, and always had the asthma, or the distemper, or the consumption, or something of that kind. They used to give her two or three hundred yards' start, and then pass her under way; but always at the fag-end of the race she'd get excited and desperate-like, and come cavorting and straddling up, and scattering her legs around limber, sometimes in the air, and sometimes out to one side amongst the fences, and kicking up m-o-r-e dust and raising m-o-r-e racket with her coughing and sneezing and blowing her nose—and always fetch up at the stand just about a neck ahead, as near as you could cipher it down.

"And he had a little small, bull-pup, that to look at him you'd think he warn't worth a cent, but to set around and look onery, and lay for a chance to steal something. But as soon as money was up on him he was a different dog; his under-jaw'd begin to stick out like the fo'castle of a steamboat, and his teeth would uncover and shine like the furnaces. And a dog might tackle him and bullyrag him, and bite him, and throw him over his shoulder two or three times, and Andrew Jackson—which was the name of the pup—Andrew Jackson would never let on but what he was satisfied, and hadn't expected nothing else—and the bets being doubled and doubled on the other side all the time, till the money was all up; and then all of a sudden he would grab the other dog jest by the j'int of his hind leg and freeze to it—not chaw, you understand, but only just grip and hang on till they throwed up the sponge, if it was a year. Smiley always come out winner on that pup, till he harnessed a dog once that didn't have no hind legs, because they'd been sawed off in a circular saw, and when the thing had gone along far enough, and the money was up, and he'd come to make a snatch for his pet holt, he see in a minute how he'd been imposed upon, and how the other dog had him in the door, so to speak, and he 'peared surprised, and then he looked sorter discouraged like, and didn't try no more to win the fight, and so he got chucked out bad. He give Smiley a look, as much as to say his heart was broke, and it was his fault, for putting up a dog that hadn't no hind legs for him to take holt of, which was his main dependence in a fight; and then he limped off a piece and laid down and died. It was a good pup, was that Andrew Jackson, and would have made a name for hisself if he'd lived, for the stuff was in him and he had genius—I know it, because he hadn't no opportunities to speak of, and it don't stand to reason that a dog could make such a fight as he could under them circumstances if he hadn't no talent. It always makes me feel sorry when I think of that last fight of his'n, and the way it turned out.

This Is a Little Ad
Isn't It?
But your future education is no small matter if you get it at the
Napa Business College
Write Box 216, Napa, Cal.

Merced is shipping great quantities of tomatoes every week.

HOMELY HINTS.

When canning fruit, wind a towel wet in cold water around the jar, and it will not break.

If the casters on any article of furniture run hard, just put a few drops of oil on them and note the result.

Place a basin of vinegar on the stove when you are boiling cabbage or onions, and the odor of the vegetables will not be perceptible.

A burn will never blister if a flour paste (raw) is quickly applied to it. One recommendation of this simple remedy is that the ingredients—flour and water—are always to be had.

To prevent cake sticking to the pan, grease the latter in the ordinary way, then dredge lightly with flour, and shake out all that does not adhere.

When making starch, add a little salt. It prevents the irons sticking, and the clothes will look nicer when ironed. A bit of paraffine has a good effect, also.

To remove fruit-stains from table-linen, spread the linen over a wash-tub and pour boiling water through the stains until they disappear, which will be in a very few minutes.

A wee bunch of cotton, pressed firmly into each finger and thumb-tip of kid gloves, will prevent ripping, and postpone the day of shabbiness almost indefinitely. Just a bit of cotton only is needed.

Before baking potatoes wash them well and rub them over with pure, fresh lard. It will make the skins come off easily when baked, and we think them much nicer. Potatoes may be pared, then buttered and baked, and and will have a delicately brown skin.

If green cucumbers are put into a brine before preparing for table use there will be no danger that the little ones will get sick because of eating them, and they are really much nicer. Try this plan, and see if you do not agree with me.

SWEET PICKLES.

"Place six hundred small cucumbers in crock and pour one cup salt over them, then cover with boiling water. Repeat three days, then place in weak vinegar five days. Then pour over them the following: two ounces allspice, two ounces almond, cloves, celery and cinnamon, three pounds of brown sugar, four pieces of green ginger, four pieces horseradish, two onions, two green peppers, vinegar to cover."

WASHING WHITE SILK GLOVES AND HOSE.

Wash in warm soapsuds, rinse and hang in a dark room. The best time to wash them is at night; they will be dry by morning. It is the light which turns them yellow.—Woman's Home Companion.

An enterprising exchange has a long catalogue for work for rainy days; but, then, who wants to work on rainy days?

The chanticleer hat proves that not only must city folks look to the farmyard for their living, but also for their styles.

The young fellow who told his best girl that she was the apple of his eye, doubtless meant that she was a "Seek-no-further."

Always stand up for the right, but do not wear yourself out with worry because you can not turn the world and make it over in a day.

Many a woman as sharp as a brier at the bargain counter, has been obliged to confess that she was fooled in the selection of a husband.—From May Farm Journal.

Is he well-trained?" asked the man.

"Pretty well,' replied the boy.

"What breed is he?

"Dunno."

"Hasn't he a pedigree?"

The boy hesitated. Then a great light came over him.

"Oh, no." he said. "It was cut off by a street car when he was a pup." —Denver "Post."

Have a purpose. No one ever reached great things without trying for them. Thoughts of what is great, love for great ideals, daily acts done in a great spirit, prepare the hero's hour and bring it to him. Purpose makes or mars life. Purposelessness ruins life.

Don't let the back step be unsightly with swill pails, cat dishes and hen food, thus strewing food and attracting flies and disease. Cart away all the old cans, broken dishes, old coats and boots, from back places and yards.

After all it is the producing power of the farm that determines the boy in his going or staying. Show him that there's money in it, and he will stick to the old farm like a sand-burr to a sheep's tail.

Dolly—"No; I won't wash my face!"

Grandma — "Naughty, naughty! When I was a little girl I always washed my face."

Dolly—"Yes, and now look at it!"—Philadelphia "Inquirer."

Laughter is a good health builder. Give me an employe who loves to laugh, who enjoys a joke, who always sees the ludicrous side of things!

San Francisco and Los Angeles Produce Markets

Los Angeles Markets

LOS ANGELES, July 6, 1910.

Butter.

Butter holds same price on lower grades with a cent and a half raise on extras. Market very firm.

Price to trade 2½c in advance of the following Produce Exchange quotations:

Extras	31½
Firsts	29
Cooking	26

Cheese.

Northern fresh	17
Anchor, large	18
Oregon Daisy	18½
Domestic Swiss	23
Imported Swiss	30

Eggs and Poultry.

Egg market very firm with quotations on case counts at 26, but some holders demanding a cent above quotations.

Paying price f. o. b. L. A. is:

Local ranch candled	30
Case count buying price	26
Eastern fresh	26

Dealers pay for live poultry f. o. b. L. A.:

Hens, per lb	15@17
Roosters	10
Broilers	16@18
Turkeys	22@24
Geese	12
Ducks	14½
Pigeons, doz.	75

Live Stock.

The following quotations are f. o. b. Los Angeles, on all stock:

Hogs, 175 to 200 lbs	10¼
Prime Steers	5
Heifers	4@4½
Calves, per lb	5½
Sheep ewes, per head, shorn	4.00@4.50
Lambs, per head	3.50
Wethers, shorn	4.00@4.50

Potatoes.

Wholesale prices are:

White Rose seed	1.00
New potatoes, per ctl	1.00@1.15

Onions.

Hay.

Scott, Magner & Miller say:

Receipts of hay on the San Francisco market for the six days ending today have been 3200 tons. This is about the same as we have received for the previous two weeks. The demand in San Francisco has not been equal to these heavy arrivals and the market has plainly felt the effect of these shipments, and is easier, and prices somewhat off. This condition applies to the entire line of the market.

Purchases that are beng made in the interior are only made in a very small way and for immediate shipment only, as these is no confidence felt in the stability of the market on the present range of prices. However, it is thought that after the Fourth of July trade conditions may be expected to improve, and while a better demand may develop, it is not thought that prices can be maintained steadily.

During this week the Government received on contract that was placed in the market some time ago, 1000 tons of old hay for shipment to the Philippine Islands but this has had no effect either one way or the other, on the current market, as this shipment was purchased long ago and re-baled for export. The general export trade has been light, although there are some shipments being made steadily to northern coast ports, which trade has relieved this market considerably.

The trade in alfalfa is not active.

Deciduous Market

SACRAMENTO, Cal., July 2, 1910.

The California Fruit Distributors reports: The following gives number of cars of deciduous fruit shipped from all points in California for the week (seven days) ending Friday morning, July 1, 1910.

Cherries.

Six cars. We will probably have no further shipments of this variety to report. Shipments for the season have now reached a total of 249¾ cars which is exactly the quantity reported for last season and has exceeded our estimates by nearly 50 cars.

Apricots.

Fourteen and one-half cars. Apricots may now be said to be done as there will be practically no more of them offered.

Peaches.

Sixty-three and one-half cars. As predicted in our last letter there has been a material falling off in the shipments of this variety. There will be no heavy shipments this week, but ample stock will be available after that time should they be required.

Plums.

Two hundred and eleven and one-half cars. The plum shipment has pased its zenith and supplies will gradually decrease until the close of the season. Tragedy, Simoni, P. Duane, Burbank, Peach, Ogon, and Mystery are now nearly done. Limited quantities will be available for the next few days. Other varieties mentioned in our last letter, such as Diamond, California Red and Sugar, together with Yellow Egg, Bradshaw, Sultan and Satsuma will be in liberal supply during the coming week.

Pears.

Thirty two and one-half cars Bartletts are now going forward from the Sacramento River district and are of fine quality. Straight and mixed cars of this variety are now available for the f.o.b. market.

Grapes.

No change to report in condition of this fruit. The first Fontainbleaus have made their appearance and have gone forward to auction. They will be in fairly liberal supply in one week to ten days.

Weather conditions continue very favorable and with the exception of a very few days has been cool and delightful. The slight burning reported from earlier sections last week, as indicated at that time, has resulted in but little damage.

ALMOND OUTLOOK

Note the following telegrams;—New York, June 20th. Conflicting reports of damage to foreign Almond crop estimate from 25 to 50 per cent of a crop. Price quoted on Princess (Nonpareil) 20 2-3 cents. Tarragonias 14 to 15½ cents, duty paid N, Y, Also—New York, June 22nd. One dried fruit house quoting Tarragonias 14½ cents; Hardshell 9 cents; California Ne Plus Ultra 16 cents; Llewellyns 13½ cents. Also—June 28th. No market yet made on 1910 crop foreign Almonds. Speculative prices are 14¼ cents for Tarragonias and 18 cents for Princess, delivered N, Y (probably the latter subject to duty of 3 cents which would make them 21 cents for Nonpareil). Foreign shippers waiting for California Association to make prices. Trade expects to be advised on established figure about July 1st. Also—Chicago, June 30th;—Nut Brokers and Jobbers all claim absolutely no price made yet on either foreign or California Almonds. Expect California price to be made tomorrow. Reported foreign crop very short. High prices expected.

The above are all significant. Two sealed bids were opened today. One ranging from 13.81 cents down. The other ranging from 13 7-8 down. Also four sealed proposals to sell on commision for us at 6 and 7 %. Other firms appeared by representatives and appealed for the privilege of selling for us on commission. The sealed bids were promptly and unanimously rejected.

Then a contract was made, with H. C. Fisher of San Francisco, for 50 tons of shelled Almonds at figures from 23 to 33 1-3 % higher than last year.

Also a contract made with the Edmond Peycke Co. of Los Angeles who are to sell all except above at terms very favorable to us, we to name the price at which to sell.

While we are practically agreed on what the prices should be we do hot want to make them public just at present. We want a little further investigation at first. Rest assured your interests are being carefully considered. —J. P. Dargitz, Mgr. Cal Almond Growers' Ex.

Citrus Market

LOS ANGELES, July 6, 1910.

With Fourth of July demand over and the greater bulk of Valencias shipped, there is a little less interest manifested in the orange market. However, with Seedlings, Mikes and Sweets out of the way, the 3000 cars of Valencias yet to go will probably be moved at a regular rate now which will insure a reasonable price for every saleable orange. The fruit is holding its quality excellently and with the sweating to color up, it makes an excellent appearance.

Lemons have lost some of their keenness and the demand is not quite so strong as before the Fourth, but at this season of the year all that can possibly be produced will be picked up at a most satisfactory price. The lemon freight rate decision can only have a most satisfactory result on market and on returns to producers.

NEW YORK, July 5.—Twenty-one cars sold. Market very strong and active on all varieties. Clear and hot.

PHILADELPHIA, July 5.—Lemons, per box, $4.00@6.00.

STAINS.

Coffee and fruit stains are easily removed if as soon as they are made the soiled article is held tightly over a basin of hot water and wet thoroughly and boiling water at the same time is poured through the stain once and again. The blemish will be washed away in less time than it takes to tell how to do it. Neither coffee nor tea stains need be the bugbear housewives make of them. Both disappear in the family wash if this is tolerably well conducted. The ugliest and most obstinate of fruit spots are amenable to the following treatment. Lay them in hot water in which a generous handful of borax has been dissolved. Leave them thus for ten minutes; then rub and wring and lay them damp upon the grass in the hot sun for the rest of the day, wetting them every hour with the borax water. Rinse them in pure water and hang up for the night. Next day cover with lemon juice and salt made into a paste and leave them again in the sun, wetting every hour with lemon juice.

LESSONS IN BEE KEEPING.

(Continued from Page 17.)

The bees from the outside will usually release her in a very few days if they have no queen in the hive already.

Before introducing the new queen it will be necessary to find the old queen and kill her. To find her you will probably have to search over each comb and keep a watch among the bees for some time. She will be long, slender bodied, and nearly twice as heavy as the worker, and much more slender than the drone. The queen should be young and secured from some reputable queen breeder, and her introduction should be three to seven days after the killing of the old queen though we have often succeeded in introducing at once. The new queen will usually go to laying in from one to three days, and 21 days later the young bees will commence to emerge.

A smoker is an essential adjunct in all these operations. Now, if you have been successful you have two hives instead of one, but the chances are that you will fail often in your first attempts on the second plan. In the next paper we will take up comb building and comb honey.

UNIVERSITY WORK IN SOUTHERN CALIFORNIA.

(Continued from Page 5.)

Pomological study of the navel orange with a view to the selection of improved types and the phases of development of the fruit will be continued and similar research extended to other citrus varieties with a view to increased commercial value and suitability.

The investigation of the life histories of the more important insects of citrus trees will be continued to extend knowledge needed to develop the most effective and economical warfare against these pests.

The culture and commercal handling of lemons will be investigated on a broader scale both in field and laboratory. The disease known as anthracnose or "wither tip" will receive particular attention.

Studies and field tests of protective treatments of leading commercial vegetables will be extended through direct investigations and cooperation with growers whose interest has been so far commanded by earlier efforts in this line that they desire to make contribution toward large scale demonstrations.

Crown gall or "root knot" of stone fruits will receive systematic study and curative treatment.

The test of peaches with a view of securing varieties of more regular growth and production under conditions which invite unseasonable activity and dormancy will be continued by means of a collection of peaches now growing upon the grounds of the station, and bybridization for the production especially of suitable varieties will be undertaken.

Propagation and growth tests of various fruit and timber trees and other plants with sewage irrigation, in cooperation with the city of Pasadena upon a farm owned for that purpose by the city, will be continued upon an increased scale to make demonstrations promising great value to all interior municipalities.

Increased equipment of the Plant Disease Laboratory at Whittier and the Citrus Experiment Station at Riverside will be secured through appropriations for that purpose by the California Legislature of 1909. Both interior equipment and out-door improvements significant from the point of view of ornamental and commercial horticulture will be advanced.

Especial work under the legislative appropriation of 1909 for "Investigations on the conditions and problems attending the culture of crops in the Imperial Valley and similar attending sections" will be pursued to the completion of a report for the legislature of 1911. This work is receiving the careful attention of the University experts in soils, animal industry, plant production, etc. , and significant results are anticipated.

The above plan was adopted by the board of regents at its regular June meeting.

DARNING MADE EASY.

The next time you have a hole in a stocking that you dread to tackle, baste a square of net over the hole. Then darn in the usual way. Draw the threads back and forth through the meshes of the net, skipping every other one, so that in darning in the opposite direction there is a mesh to darn through.

Keep on hand for this purpose remnants of black, white and ecru net. They can be put in a small bag, in the darning basket to be in readiness whenever needed. A cotton net with considerable body is the best to use for an underweave. Canvas, unless very soft, is apt to cut the cotton.

For darning sheerer fabrics wash blonde can be basted on the under side of the hole filled in the same way. This method must not be used where the hole is in a prominent place.

NONE OF HIS BUSINES.

One morning a rustic appeared at the window of a postal station, and after peering through the bars inquired:

"Hev yeou got 'bout 50 cents' worth of stamps, mister?"

"Certainly!" returned the clerk. "What denomination, please?"

"Wa-al, sir, if it's enny of your business, I'm a Baptist."—Ex.

GEO. H. LEE IN CALIFORNIA.

Geo. H. Lee, who for the past 25 years has been a breeder of poultry, and for more than 15 years a manufacturer of incubators and all kinds of poultry remedies, has located a store in California. Mr. Lee has traveled extensively, having visited every state in the Union, as well as Canada and Mexico, studying poultry culture. He decided on California because of the bright outlook for the industry, always a good market at high prices, with the demand exceeding the supply. Mr. Lee has written a book on poultry called "Mandy Lee," which contains some very interesting and helpful matter for poultry raisers. This book will be sent free if you write to him, mentioning the Cultivator, at his new store, 225 West Second Street, Los Angeles.

A Fresno Vineyard Scene at Raisin Drying Time

In 1870 There Was Not a Vine in Fresno County. Today There are 106,000 Acres, Which Makes it the World's Greatest Producer of Raisins. Agriculturally the County Now Produces $30,000,000 Annually. This is Largely from Raisins.

Established 1889
Assets $2,730,000

6% Twenty-one Years Old 6%

June 20th, 1910, marked the twenty-first birthday of the State Mutual Building & Loan Association

These twenty-one years represent a steady, satisfactory growth, as substantial and secure as the growth of the city itself.

During this time this Association has made possible the erection of more than three thousand substantial homes—which plainly indicates the important part it plays in the upbuilding of this community.

IN THE TWENTY-ONE YEARS WE HAVE MADE SEVEN THOUSAND EIGHT HUNDRED LOANS aggregating between eight and ten million dollars. We have paid to our customers between four and five million dollars—and have never failed to meet all demands when due.

We have not now one dollar's worth of real estate on our books taken for debt, and while we have made the large number of 7800 loans, we have only had forty-two foreclosures.

THE REMARKABLE RECORD MADE BY THIS ASSOCIATION is largely due to the capable, careful management of every detail of the business, the management having remained practically the same through all these years. The officers and directors are prominent, successful business men of large affairs, giving their personal attention to this Association.

As We Stand Today

The active accounts on our books number over - - 4,000
Our fully secured loans number more than - - 2,500
Our assets total over - $2,700,000

This history demonstrates very forcibly that your money can be placed with us, with a guarantee that it will earn 6 per cent interest and be as absolutely secure as with other institutions paying a lower rate of interest.

Our methods have earned the complete confidence of thousands of people who want their money to earn the utmost—and have no worry about its security. Each year brings a greater increase in the amount of business transacted—as the following table shows:

Assets at the end of 5 years, Jan. 1, 1894	$ 213,201
Assets at the end of 10 years, Jan. 1, 1899	635,719
Assets at the end of 15 years, Jan. 1, 1904	1,388,700
Assets at the end of 20 years, Jan. 1, 1909	2,144,140
Assets today, July 20, 1910, are over	2,790,000

This story of the success of this Association is of vital interest to every man and woman who has money that should be working for them to the greatest possible advantage. Call at our office, or write for an explanation of our plans and sample certificate.

The Pear Thrips and How It Must Be Controlled

By DUDLEY MOULTON, Deputy Commissioner of Horticulture at San Francisco.

Mr. Moulton Has Observed Closely the Work and Life Habits of the Thrips and His Observations Are of Value.

SEVERAL years ago the matter of controlling the Pear Thrips was considered one of the important problems which confronted the ver of deciduous fruits in California. Today area of orchards which are attacked by this ect has increased many times over and the mulative injury, the continued attack on the e orchards for several years, has brought the ter to a crisis in several localities and esially in the Santa Clara Valley. Many orards are weakened to such an extent that they ill soon be past recovery unless the insect is mediately checked. The financial loss to the r and to the several communities has brought roblem to the very door of the banker, the hant, and other business men and it is of vital portance that they too understand the thrips and how it can best be controlled.

New Remedies.

The many recent theories and discussions of "new remedies" for this insect have brought out much unfair and unfavorable criticism of those who have borne the burden of the investigations and who have tried honestly and with all fairness to give everybody's pet idea a trial, but who at the same time have gone quietly about their work with only the one purpose in view, namely, to get the most reasonable, practicable, cheapest method of treatment for this insidious insect. The newly suggested theories of "soil fumigants" and "lime" sprays are not new at all, but have already been considered, experimented with, and classed out as of little or no importance, these giving way to more effective remedies. These new theories seem more or less reasonable to the lay mind or to the unsophisticated orchardist. They are not only misleading but they cause the grower to distrust the best efforts of those who are really trying to help him.

Injurious insects are normally controlled in one of two ways either by their natural enemies such as internal parasites or predacious feeders, or by artificial means. No parasitic natural control for the thrips has yet been found and therefore if we are to save our orchards we must resort to the best known artificial means. It is the discussion of these methods that is the burden of this article.

Tried Everything.

When the investigation by the Department of Agriculture was first undertaken, the writer with other entomologists at Washington enumerated every possible artificial remedy which seemed at all practicable. These were to be tried separately and combined and were to be worked out in conjunction with the orchardist himself. All experiments were to be based on an exact knowledge of the insect and recommendations for its control were to be based only on the results of such experiments. Never have control methods been advised to follow out some pet theory of the investigator or after only superficial examinations of their experiments. It therefore now seems surprising that any party, be he investigator or practical fruit grower, should try to discourage or discredit the work of those who have been willing to fight the problem through against the greatest odds and the more so now that these efforts are being crowned with success. The proof of this success is the normal crop of clean prunes and pears on the treated orchards. Men who must be indifferent, who will continue to ignore the means of control offered, although they cannot supply an alternative, who are not willing to try to help themselves, will probably continue to have partial or absolute failure of crops. On the other hand men who are willing and eager to learn how to control these thrips, who will follow the recommendations of plowing and spraying, doing this work with care and intelligently can insure themselves of normal crops of fruit. It may not be during the first year, but it will surely come the second year and afterwards.

Life History.

The life-history of the pear thrips has already been much written about, but the following facts are apropos at this time. The mature adult thrips are coming out from the ground during a period of more than a month from about February tenth to March fifteenth. They fly from the ground up onto the trees. These adults feed in the opening buds and blossoms and place their eggs within the tender tissues of the plant. They do not bite off particles of the outer tissues of the plant, hence we cannot kill them by spraying poisons onto the trees. If they are killed by a spray it must be by an external irritant or poison. Normally the adults die immediately after placing their eggs. The young larvae feed as did their parents on the tender plant tissues. They are without wings hence cannot move from tree to tree and when fully grown they must drop to the ground under the tree on which they were born. The larvae may be seen on the trees during the period from March tenth to about April thirtieth. Upon entering the ground they penetrate to a depth of usually between four and nine inches. Each forms a tiny cell and remains within this until the following February. They are passing through the pupal stage during the period from September to December. They emerge as fully developed insects with wings.

Methods.

Experiments in (1) irrigation, (2) fertilization, which included tests of the so-called soil fumigants, Apterite and Vaporite, (3) plowing and (4) spraying, have all been given a fair trial and each can be now given its proper place in the methods for controlling the thrips.

Irrigation.

Irrigation should affect the thrips in one of two ways, first directly by actually killing them when they are submerged and secondly indirectly by placing the soil in such condition that plowing during the fall can be pursued to better advantage. Blocks of soil in which thrips were numerous have been submerged continuously for a period of 72 hours and without killing any of the insects. They are so strongly resistant to water that it is not practicable to submerge them long enough to insure their destruction. Irrigation to actually kill the thrips in the ground is therefore not to be considered. Late summer or fall irrigation, wherever possible, is greatly to be desired if later such lands can be plowed as recommended as the auxillary treatment with spraying.

Fertilizers and Soil Fumigants.

It is a well established fact in the practice of horticulture that fertilizers must be applied to soils where a single crop is harvested from the same area year after year, if the productiveness of the orchard or field is to be continuous. Without doubt many of our orchards need such treatment. The common fertilizers such as potash, phosphoric acid, and nitrogen, in their various forms, are in themselves not insecticides. Even if the whole surface of the ground were to be covered for an inch or more in depth, or if this amount of fertilizer were to be drilled in, it is probable that the insects would not be disturbed. Fertilizers should be applied to strengthen the trees, but it must be stated most emphatically that this treatment will not kill the thrips. Several preparations have been manufactured for the double purpose of fertilizer and soil fumigant. The insecticidal value of these mixtures lies in the strength of the crude carbolic acid or the crude creosote oils which they contain. If such mixtures could be drilled into the ground at the rate of 100 or 200 pounds to the tree they might kill some of the thrips. "Apterite" has been tried at the rate of one pound to the surface square foot or at about 400 or more pounds to the tree. This was drilled into the ground to a depth of about four inches or to a depth immediately above where the thrips were located. The blocks of soil thus treated were confined in galvanized iron cages and at their normal depth in the ground so that the inclosed soil received the full benefit of the fumigant. In one experiment the ground was watered, in the other left dry. The experiments were examined several weeks later, the thrips were all still living. We can assure the advocates of soil fumigants that it will take many tons of their mixtures per acre to kill even only a small per cent of the thrips. This is obviously absurd.

Cultivation.

The benefits of plowing and thorough fall cultivation for thrips are not yet fully appreciated. The thrips are actually in the ground from May first or sooner until about the middle of February of the following year. They are usually between four and nine inches from the surface. This statement is based on the averages of the records of several hundred blocks of soil each of which was examined in layers inch by inch and the thrips actually removed and counted. Some of the insects do not penetrate deeper than an inch or two while others go even lower than nine inches. They continue in the larval condition from the time they enter the ground until the early fall when they gradually change to pupae and then to adults. It is obvious that a large per cent of these thrips can be disturbed by thoroughly plowing and breaking up the soil. Just what per cent can be killed can only be approximated by experiments, and the results of such experiments for the 1909 season can be seen by referring to the bulletin. "The Pear Thrips and Its Control." Here about 70 per cent less thrips actually emerged from cultivated ground than from soil which was not treated. Similar records have been obtained during the present season. About 70 per cent of the thrips were killed by the plowing method. This treatment of the soil does not mean to simply plow at any time when the thrips are in the ground, but rather only during a certain period when they are most susceptible to injury. This period is from about October first to not later than January fifteenth. Plowing should not be continued after the first of February for then it opens up the ground so that the thrips can get out much earlier and the subsequent injury is more noticeable than where no plowing at all has been done. Plowing must be thorough, it must be followed by a harrow to break up the clods. Crossplowing should be resorted to to insure breaking up the soil to a uniform depth

Citrus and Sub-Tropical Fruits

A LIVE CLUB.

THE Patrons of Husbandry, the Farmers Clubs, the University Institutes, together with the Short Course at the University Farm, are the principal places where the farmer may sharpen his intellect and the better prepare himself for the diverse problems of his calling. Another factor, which has been a large one in extending information over the state, is the demonstration train conducted by the Southern Pacific Railway and the University of California. The organization of the farmers of the northern part of the state has been largely in the Grange, though the Farmers Union has been somewhat of a factor. The Farmers Club has also been encouraged but not to the same extent as in the southern part of the state. The Grange has no representation whatever south of the Tehachapi; the Farmers Union has a number of locals but the Farmers Club still predominates.

One of the strongest of these for years has been that at Claremont, Los Angeles county. While a farmer's club, it has passed under the name of Claremont Pomological Club. This club has monthly meetings during nine months of the year, but during the summer it takes the usual school vacation. The last meeting for the summer held on the last Monday in June, and the first meeting of the next year held on the last Monday in September, have as an especial feature a picnic at Ganesha Park, Pomona. While the membership of the club is not large, these meetings attract attendance from many parts of Southern California, and the programs are arranged to have a wide interest.

The program at the recent last-of-the-year meeting held on the 27th of June, was given over to consideration of two topics; the forenoon to frost protection, the afternoon to fumigation.

The consideration of the subject of frost protection called for discussion of two features, namely, the scientific side and the practical side. The former was in charge of Prof. A. B. Wollaber of the Weather Service, in charge of the Los Angeles station. After an informal discussion of the subject, Mr. Wollaber read a paper on the subject written by Prof. Alex. McAdie of the San Francisco office.

Charles C. Teague of Santa Paula, took up the practical side. Mr. McAdie's paper and quotations from Mr. Teague's discussion will both be given in the Cultivator of a couple of weeks later.

Prof. C. F. Baker, Assistant Entomologist of Pomona College, and Editor of the Journal of Entomology, opened the discussion on fumigation. He supported the view that the practical worker's greatest aid came from the investigations of the trained scientific mind, and that in order to have proper scientific training, the educator should be able to do with his hands as well as reason with his mind. He referred to large organizations of capitalists who are promoting great agricultural interests, especially mentioning the rubber industry in Mexico and the sugar industry in the Hawaiian Islands. These companies, he said, employ scientific men to investigate problems which the state and nation are unable, or, if able, are unwilling, to take up to the extent which their best interests require. Some of the brightest chemists and entomologists and engineers of the country have been employed by these large concerns, and almost invariably with great profit. They have found that the soundest and most practical work is founded upon the scientific. He referred also at some length to the particular work of Pomona College in preparing young men for scientific work in the orchards of California. This has been especially the case along entomological lines.

The practical side of fumigation was treated at length by Mr. Sellars, in charge of fumigation of the great Arlington Heights orchards at Riverside. The fumigation of these orchards requires the expenditure of $35,000 to $40,000 annually, and every effort to make the work effective and economical has been used. Mr. Sellars' paper is too long to insert in this issue but will be liberally quoted from later.

Mr. Fred J. Smith appealed for more of the co-operative spirit in the matter of orchard work. He referred to the fact that while California has the greatest co-operative marketing organization in the world in the California Fruit Growers Exchange, the most of the people have not yet learned the first principles of co-operation. He said that in Denmark ninety per cent of the dairymen are members of co-operative organizations, and these have practically captured the markets of Great Britain. They not only market their products, which bring in over $90,000,000 yearly, but they buy everything needed by their members. That little country has 250 of these co-operative organizations, nor does their work stop with the purely commercial side. Any movement of a political nature which concerns the farmer is taken up, and the members stand almost as a man for measures advantageous to their calling. All kinds of merchandising, banking and other activities are also conducted by these co-operators. California must more fully adopt this co-operative principle. The speaker referred to the fact that many farmers could not overcome their prejudice against paying somebody else to manage their business. They allow their prejudice and egotism to prevent them from joining their neighbors, and the result is contention, or at least lack of unity, which allows one producer to let his products be used to batter down the price of his neighbor's. Mr. Smith made a direct appeal to citrus growers from two miles west of Covina to the eastern boundary of Los Angeles county, to unite in an effort to eradicate or bring under control all orchard pests. Contracting fumigators had agreed to take up the work if growers would get together, and do it for a liberal percentage, but Mr. Smith appealed to growers to employ the most competent man to be secured and so keep the business management entirely within their own hands. The objection was raised that such a man would require a large salary, but the speaker replied that such salary

would not begin to amount to as much as the percentage demanded by the contractors, and the difference might just as well be kept by the growers.

CO-OPERATION A SUCCESS.

Organization, which is co-operation, has become the rule of modern business. It is the keynote of the success of every industry in these days. Nowhere is it more needed than in the marketing of agricultural and horticultural products. The individual grower standing alone is like one of the sticks in the old story, which were easily broken. United with his fellow growers he is like a component part of the bundle of sticks which the young men could not break at the command of their father.

The individual grower, shipping alone and on no system, first encounters the transportation company—organization. Next he must deal with the commission merchant who acts openly or secretly, in combination with his fellow merchants—organization again. If things do not go to suit him he complains, he seeks concessions, reparation. Too often he finds that he might as well try to stop a locomotive with a straw. He is bitter against the transportation company, but it is not to blame for following those rules or methods which it has found essential to the lucrative conduct of its own business, or most beneficial thereto. He scolds at the commission merchant, but the latter is simply looking out for his own interest and is not bound to consider that of the grower before his own. Each of the hundreds of growers is an individual problem to the transportation company and the consignee of the fruit or vegetables, each with different ideas, different desires, different claims from every other.

Again, it is said that the successful management of every hotel or boarding house lies in the buying, not in the amount received for board. A well organized and managed hotel, or a boarding house with a good manager, can make money with a smaller number of patrons than another hotel or boarding house entertains and feeds and yet fails. Conversely, the profits of agricultural or horticultural enterprise lie mostly in the successful marketing of the products. Successful in that case means systematic and system is possible only with co-operation when it must meet co-operation.

Fruit and vegetable growers in Florida have met with other discouragements in the past than poor crops and they will meet with still more in the future with larger crops of citrus fruits, strawberries, celery, potatoes and other products of the soil and more competitors at home and abroad. If they hang together and aid the organizations now existing or about to be founded they will overcome these obstacles to success. As individual members they will benefit by the mutual understandings between transportation and market men on the one side and the organization they belong to on the other; by the improved methods of putting their product on the market which the Exchange can devise after a minute study of the situation such as is impossible to the individual grower, especially the small grower. The transportation companies will cheerfully make concessions to a united body of the growers which they would find it impossible to make to individuals each pulling a different way, some not exactly certain of what they want.

When every farmer and fruit grower belongs to an organization of his kind and makes up his mind fully and self-convincingly that the majority of that organization knows better what is good for him than he does himself, in cases wherein he is not altogether satisfied with its conduct; when every one resolves to support that organization loyally and at least give it several years' trial before condemning it and the principle of co-operation in selling; then and not until then will fruit raising and trucking in Florida be a solid proposition with an unvarying record of success to each hard-working man engaged in it.

These remarks apply to the Florida Citrus Exchange, the pineapple growers, the celery growers and to each and every organization they and other classes of agriculturists and promologists essay. Growers of citrus fruits should endeavor to attend the annual convention of the Florida Citrus Exchange at the Tampa Bay Casino, Tampa, even if they must make sacrifices to do so, and whether they are members or not. If not members they should haste to become such. The record of the Exchange for its first year is one of remarkable success, when all things are viewed in their proper light.—Jacksonville (Fla.), Times-Union.

WINDMILLS IN THE SEMIARID WEST.

The rainfall in the semiarid West being always light, settlement in that section is to a certain extent hazardous, but the millions of acres now barren, which would prove rich and fertile if irrigated, are now attracting eastern farmers who are prone to risk failure in view of the possibilities in years of favorable precipitation. Some of this land will be reclaimed through irrigation, and the growing of drought-resistant crops and the adoption of improved methods of culture will do much to make the farming of these lands less hazardous. But there have been many deplorable failures which could have been averted, had the settlers fortified themselves agains periods of drought by irrigating small parts of their holdings.

It is with a view of helping such that the feasibility of pumping water for the irrigation of small areas in connection with dry land farming of more extensive areas was investigated by the Irrigation Office of the U. S. Department of Agriculture.

Large wind movement provides a cheap source of power for lifting underground water, and the results of these investigations are embodied in a Farmers' Bulletin (No. 394) entitled "The Use of Windmills in Irrigation in the Semiarid West," just issued by the Department. The possibility of this is set out in a simple comprehensive way, and practical suggestions are made to those who are now using or are contemplating the use of windmills for pumping water for irrigation. The data given for plants on the Great Plains show, however, that the windmill is not a cheap source of power, that to accomplish this result requires capital, and that if the conditions require too great outlay, it precludes the possibility of such a procedure.

The bulletin treats on the sources of water supply, the quantity of water available, well casing, sinking wells, capacity of mills, choice of tower, erection of mills, pumps, reservoirs, maintenance of mills, crops under windmill irrigation, and closes with a description of methods and mills now in use in Kansas, Nebraska, Colorado, and California.

KEEN KUTTER
Farming Tools

No imperfections in temper, mistakes in adjustment, or wrong calculations for size and weight are ever discovered in Keen Kutter farming tools. They fit the hands, and arms and height of the average man as no other tools do or can; and the reason lies in the fact that the makers construct no tools until *experiment proves the model right.*

Note this Keen Kutter spading fork—true as a die, just long enough, just heavy enough, and full of springy temper and long wear. It illustrates the good qualities of other Keen Kutter tools—scythes, hoes, rakes, forks, axes, shovels, etc., every one of which is backed by the liberal Keen Kutter guarantee.

Always buy Keen Kutter tools for farm and workshop—the line includes everything for both outdoor and indoor workmen as well as pocketknives, razors, shears and table cutlery.

Deciduous Fruit Culture

CAN THE ORCHARDIST ADD STOCK GROWING WITH PROFIT?

By E. R. Ong, San Jose.

THE high price of live stock and dairy products compared with the price of fruit, in many instances recently, may turn the attention of the orchardists to combining the two. I know by personal experience how little time there is for stock or poultry in our busy fruit seasons, but with hogs nine and ten cents a pound, it certainly would pay to put forth the little extra effort, even in the busy season, that would be required to carry four or five pigs through to fall. Then if thrips, pear blight, or some other evil destroys the bulk of the crop, we will have a little income for the inevitable taxes.

There are many advantages to this plan. In the first place, instead of buying so much commercial fertilizer, we are getting without extra cost an article that in some respects is superior to any chemical or mineral fertilizer and at the same time we are utilizing the by-products and wastes of the farm which otherwise might be a total loss. Our great packing houses claim that their only profit is in utilizing what was formerly wasted. Surely our orchards should be run on the same basis. A good alfalfa pasture, with hog-tight fence, well irrigated and with plenty of fresh water for the stock, will be found a great saving of time and feed. Here the laying hens and growing chicks will have the best green feed possible and now we can keep a cow and revel in peaches and cream, instead of buying milk by the pint and butter at the store, just as if we lived in the heart of the city.

The pigs can roam at will through the spring and early summer with very little care, and be ready for the pears and peaches the cannery rejects. By the time the drying is finished the pigs can be put on full feed and instead of allowing small and inferior fruit to cut down the price on the entire crop, grade it out and feed it to the hogs, finishing them with a little grain and you have an animal that is far superior to one fed in a slaughter pen.

Below are given the feed values of some fresh and dried fruits as given by Professor Jaffa:

FRESH FRUIT 100 Pounds Equivalent.	Wheat Straw	Alfalfa Hay	Corn	Wheat	Wheat Bran	Cocoanut Meal
Apples	34	20	15	16	18	13
Oranges	33	19	14	15	17	12
Pears	40	23	17	19	20	15
Prunes	46	27	20	22	24	18
Apricots	40	23	17	19	20	15
Figs	50	30	23	25	27	20
Grapes	50	30	23	25	27	20
Watermelons	22	13	10	11	12	8
DRIED FRUITS.						
Prunes	175	104	78	84	92	68
Apricots	194	115	86	93	102	76
Figs	186	110	83	89	97	72
Raisins	216	128	97	103	111	84

Besides utilizing the inferior fruit from the ranch some orchardists might find it profitable to buy wastes and low grade fruit from the packing houses.

The pitted prune trade is becoming quite a factor in our markets and the wastes from the pitting will sometimes be found quite valuable. Prunes ranging in size from 90-100s and smaller are a drug on, the market, often held over a long time, accumulating interest and perhaps having to be sent to European markets before being sold and then at a narrow margin, and of course the expense for facing is greater on the small fruit then any other.

There is even greater expense in handling damaged apricots or "slabs," to use the trade term. By this is meant an apricot that has been mashed out of shape in drying, generally an overripe one. These are hand picked to separate them from the good fruit then each piece is run through a hand cutter and trimmed into shape. These trimmings are sold to the distillery at a low price, and after all this expense and waste it is only a low grade fruit.

So, is there any wonder that the packers are so partial to choice fruit even to the point of paying a premium for it.

High priced hogs will dispose of low priced fruit to advantage

ALMOND PRODUCTION AND CONSUMPTION.

The almond production of California for the past 12 years has varied from 450 tons in 1898 to 3270 tons in 1902 while the average has been 1877 tons or one pound for each 23 of the population of the United States.

The importations of almonds for the same time has varied from 2570 tons in 1901 to 8572 tons in 1908.

The available supply of both California and imported almonds for consumption has varied from 3323 tons in 1908 to 11,572 tons in 1908, or an increase of 248% in ten years time. The average per capita consumption of almonds in the United States for the 12 years has been one pound per annum to each six people. We certainly have room for increasing consumption of almonds.

The California crop for 1910 is estimated at 3500 tons and the foreign crop available for importation, at not over 2750 tons, which would make the available supply for the year one pound for each seven people in the United States or 800 tons less than the average for the past 12 years. This of course means higher prices for the almonds this year because one-seventh of the people who ate almonds last year will have to go without this year and they will make the other six-sevenths pay for what are eaten.—California Almond Growers Exchange.

The plan of handling the coming raisin crop proposed by Mr. Clark, under which 54,000 tons of raisins were to be signed up at three cents, has been rejected.

THE PEAR THRIPS.

(Continued from Page 27.)

especially in the rows between the trees. It has been proven that plowing is a help but not an absolute control. It kills a per cent but not all and if prosecuted at the wrong time the orchardist does himself more harm than good. Some soils cannot be plowed during the winter months and we appreciate that some seasons are not favorable to winter plowing. The orchardist however should not lose sight of the fact that every thrips which is destroyed during its period in the ground is one less to kill during the very short time when they are moving up from the ground to the trees and entering the buds.

Spraying.

Spraying is the last and the most important artificial method to be discussed in controlling the thrips. The insect does not take internally parts of the outer tissues of the plants which might be poisoned, hence the poison sprays are not to be considered. That these sprays are not effective has been proven conclusively by numerous experiments. The mixtures then must be some kind of an external irritant or poison such as oil or acid emulsions or tobacco.

Much prominence has recently been given to a lime spray, the theory being that the tiny feet of the thrips are sticky and that this sticky surface would have an unusual attraction for the particles of lime or rather that the lime would draw out the viscid substance in the thrips feet, that the feet would become parched or burned and that this would either kill the thrips or drive them away from such sprayed trees because the means by which they held themselves to the tree was unduly lost. This theory is based on the statement that "Instead of clinging to the plant by means of claws, the foot ends in a small bladder-like structure covered with a sticky substance. This sticky material is produced in sufficient quantity to provide for that which is left wherever the foot of the insect rests, and if it were compelled to walk upon a substance that is more absorptive than the leaf it is quite possible that the supply would be soon exhausted and the insect would not cling to the plant." As a matter of actual fact the thrips foot does end with a claw which must serve it while walking on a leaf or other matter and which probably also serves it when the thrips is working its way out of the ground. The bladder-like structure is also present, but it is not sticky as is stated, nor is there any visid fluid secreted through it. The effectiveness of the lime spray, if indeed there is any benefit, must be attributed to some other cause. The actually dead thrips were never seen in this experiment and it was only supposed that they were either killed or driven away. The observer also states that a few days later "adult thrips were equally numerous on the sprayed as well as the unsprayed trees." It has been noticed that some benefit can be derived by spraying the trees with any kind of a mixture if this material is applied under high pressure and just when the thrips are most numerous on the trees. Many thrips are actually killed or injured or stunned by the force of the spray. The lime spray or any other spray can therefore be of some benefit but the theory upon which this lime spray is supposed to be successful is absolutely without foundation.

In their experiments, those in charge of the Government work have for three years tried out various mixtures with lime such as lime and sulphur, lime and bluestone, lime and arsenate of lead, and these experiments were placed side by side with other sprays of such emulsions as creosote and other various oils and crude carbolic acid and tobacco, and it is only by a careful comparison of these when they are applied under similar conditions that the better sprays can be selected and the others eliminated. A comparison of sprays cannot well be made when they are applied individually in different fields. After careful observations the lime mixtures gradually gave way to the more penetrating oil and tobacco sprays. The various emulsions with oils, carbolic acid or tobacco are all contact irritant sprays and after they are applied the dead thrips can actually be seen.

Whipples Opuntia—"Buckhorn Cactus."

Injures Trees.

The success (judging from the fruit on the trees of this sprayed orchard) of a certain crude carbolic spray in one orchard in the Santa Clara Valley has been talked about as an example of successful spraying. A similar spray to this one, if not the identical spray, was one of the first preparations which was tried out against the thrips. It proved to be most deadly to the thrips, but noticeably injurious to the tree. Other combinations of crude carbolic acid were tried and with similar results. Mr. Stevens appears to have used this spray after it was heavily diluted. He applied it with a high pressure and was probably very careful in the application. Good results must follow such treatment, and it is probable that any of the contact sprays would prove equally successful in the hands of Mr. Stevens. It is probable that the same spray in the hands of another man would have given equally poor results and have been harmful to the trees. The secret of success in controlling thrips lies not so much in the spray itself, if a strong contact insecticide is used, as in the carefulness and thoroughness with which the material is applied.

The Safest.

The oil emulsion sprays as recommended and especially in combination with the tobacco extracts, are probably the most effective and safest thrips contact sprays that we know of. They actually kill the thrips and a man can after about two years practically eliminate the thrips from his orchard. A few others will migrate in but the thrips that are actually in the ground under his trees are the ones which he should be afraid of. If the orchardist does not wish to spray with the formulas which have been found most successful, and at just the proper time, or if he does the work carelessly he should blame no one but himself. It is not the fault of the spray, but the man.

General Instructions.

The recommended methods for controlling the thrips are (1) to thoroughly plow and break up the soil during the period from October first to January fifteenth and not later than this under any condition, and (2) to spray with an oil or tobacco emulsion when the adult thrips and larvae are on the trees. A combination of Bordeaux or lime and sulphur with one of the oil or tobacco sprays will also prove helpful because of their value as fungicides. The first year may require three treatments, two for adults from March 1 to 5 and later again about the middle of March and one application for larvae during about April 5 to 10. One or two applications or perhaps none will be required regularly during subsequent years. It cannot be stated too emphatically that the effect of spraying is accumulative from year to year. This is most aptly demonstrated this year by passing through those orchards which were well sprayed last year. The evidence is a full crop of clean prunes. No more telling proof should be desired. Killing the adults by the first applications protects the trees from the later brood of larvae, and spraying to get all subsequent larvae insures that these insects are not going to drop to the ground and hide under the trees to come out early the following year. By all means kill the thrips before they get into the ground.

Plow and Spray.

There can be no alternative for the grower if the thrips infest his orchard badly. He must either spray or plow and spray, as recommended, or suffer from the thrips as during the several past years. There seems to be a great desire on the part of the grower not to want to plow or to spray even though he can seem to save him self in no other way. The thrips are in the ground now and under his trees. They will come up next February and the prospects are for a larger brood than during the past season. Plowing during the fall and winter, if done as recommended, will kill a per cent of them. Spraying for adults just as the buds open will kill many more and may insure a crop. Spraying for the larvae will kill the new brood before they get into the ground, and will insure protection for the following year. No natural enemies which are effective to control this insect are known. It now becomes the grower. the sceptical theorist, the business man, and above all the near-sighted, doubting entomologist, all alike to stop knocking and to approve of what have been determined the most effective remedies and to unite to overcome this insidious insect. Naturally it will take several years for many to appreciate what great odds the several experimenters have had to pass through to establish reasonable methods for controlling the thrips and the greatest discouragements of all have come from the lack of appreciation by the orchardist himself. Neither those in charge of the Government Station, the State Entomologists nor the local County Commissioners can do this work for the grower, he must do it himself and the matter is now up to him.

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

FEEDING COTTONSEED MEAL.

(Concluded from last Week.)

It is interesting to note that as far back as 1892, Prof. M. B. Hardin, of the South Carolina Experiment Station, reported the finding of both meta and pyrophosphoric acid in all of a series of samples of cotton-seed meal which were examined in his laboratory. He says of their presence: "The salts of the last two acids are said to be more or less poisonous, and though their precise physiological action has not I believe been determined, it is quite possible that some of the peculiar and in certain cases injurious and even fatal effects produced by the use of cotton seed and cotton-seed meal as feeding stuffs may be due, in a measure at least, to the presence of these meta and pyro compounds." In a paper before the Association of Official Agricultural Chemists in that year he mentions the finding of these two forms of phosphoric acid in aqueous solutions of cotton-seed meal, and raises the question whether they exist in the original cotton seed or are formed as a result of the process of the preparation of the meal.

Dr. Crawford refers to Professor Hardin's work, and notes the absence of any pharmacological tests to bear out the suggestion made in regard to the relation of these bodies to cotton-seed poisoning. The matter appears not to have been followed up by that station until last June, when a project was entered upon with that work and hypothesis as its starting point.

A variety of confirmatory experiments were conducted by Dr. Crawford, together with studies on the nature of the compound, and pharmacological tests with sodium salts of the three forms of phosphoric acid. His final conclusion is that "the chief poisonous principle in certain cotton-seed meals is a salt of pyrophosphoric acid. In some this salt seems to be a simple one, presumably inorganic, while in others it is more complex, perhaps an organic one. Probably this difference in the combinations of pyrophosphoric acid may aid in explaining the variation in toxicity of different meals. In certain cotton-seed meals one would expect to find salts of metaphosphoric acid entering into this action. To be harmful the pyrophosphates must be in such a form that they can be absorbed, or the phosphoric acid ionized in the gastro-intestinal tract. The harmlessness of certain cotton seeds and meal is mainly due to the fact that in them the phosphoric acid exists largely, if not entirely, as a compound of ortho, and not as one of the other phosphoric acids. Small amounts of pyrophosphates can apparently be borne without injury. The amount of the salt which may be permitted in cotton-seed meal should be determined."

Aside from the avoidance of too high heating in manufacture, the author does not suggest a remedy for this difficulty in feeding cotton-seed meal. He points out that "at present it would seem to be the wisest course to test each lot of meal by a combined biological and chemical method, and if any excess of poisonous properties is present, to utilize such meal for fertilizing purposes or use for feed with the greatest caution, and reserve for more indiscriminate feeding those which prove harmless to experimental animals."

This work suggests a line of study upon the relation of the character of the soil, etc., to the production of the poisonous body in cotton seed, the part which fertilizers may play, the influence of micro-organisms, and an inquiry as to whether the pyrophosphoric acid is derived from the soil or is due to a physiological process in the seeds. The possible relation of cholin or similar bodies as contributory causes would also seem to be in order. Furthermore, "the question as to whether pyrophosphates will induce a hypersensibility and thus increase the activity of pathogenic organisms should be investigated."

The importance of this discovery as a contribution to our knowledge regarding cotton-seed meal as a feeding stuff will be generally recognized. But beyond this the study will make possible and suggest a whole train of studies upon various ingredients of feeding stuffs in their relation to the animal organism. The desirability of investigations starting out from this point of view has been previously referred to, and is illustrated by several studies now in progress.

Cream Separators, all sizes and prices. O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.

WHO PAYS THE $25.00 TARIFF PER HOG?

A subscriber at Eureka, Mr. W. E. Dickinson, writes regarding his experience in disposing of porkers as follows:

"I had two hogs weighing 650 pounds live, to sell, and investigating found butchers were paying 7½ cents and retailing the meat at 20 cents and lard 25 cents.

"Thought of dressing them myself but found city ordinance prohibiting sale of same unless slaughtered at licensed slaughter house. The price paid for slaughtering, etc., makes this no inducement.

"Now I am unable to convince my wife who paid that $25.00 difference each hog gained in price after it left me, and before the 'ultimate consumer' received it."

In a letter he adds: "I do not know that this is an unusual experience. Perhaps other ranchers have the same thing to contend with, but I would like to hear from others in other parts of the state. It is possible such conditions might be corrected by proper publicity." Mr. Dickinson further adds that many other farm products are in same condition, that while the farmer is enabled to deal with consumer, there is fully 100 per cent added to producer's price before consumer can secure food products.

A sheep grower who has pastured the hills of Lassen county for the past 38 years says this is the dryest season in the thirty-eight.

JUST HORSES AND MULES.

A mule should never be kept in a stall, but in a large, roomy pen. An open lot with a shed for shelter, is even better.

The expense of caring for a mule is less than for a horse. The mule eats less, requires no blanketing, no stall and is more easily kept clean.

A stallion shut up in a dark stall without the companionship of other horses often becomes moody and savage.

Some English stallioners ride a pony while leading their horses for exercise, and the horses become so attached to the ponies that they become fretful and uneasy when they are not near. At night the ponies are given a stall next to the horses.

Pure-bred draft-horses are always in big demand at good prices. Many pure-bred stallion colts are sold at $1,000 as three-year-olds, while pure-bred mares bring from $300 to $500.

A really good horse is never of a bad color but some colors, such as perfectly dappled grays, pure blacks, and blue roans command better prices than others.

If English farmers can afford to use pure-bred draft-mares that are worth $500 for ordinary farming operations, why cannot our farmers afford them as well?

Investigations and experiments show that it does not make much difference whether a horse is watered before or after feeding, provided he is not allowed to drink his fill on an empty stomach while warm.

It is a slow process grading up horses, and the best way is to buy a pure-bred mare and breed to a pure-bred stallion.

The average farmer will do well to let the fancy saddlers alone, as it requires at least a year of regular training to train a first-class saddler to all the gaits, and this takes time and money.

Any man who will strike a horse in the head should never be allowed to drive one again.

When the plow-horses are brought in at noon the harness should be removed and the shoulders washed and rubbed dry while they are feeding.

It is just as necessary to fit a collar to a horse as it is to fit a shoe to the foot.

It is bad practice to allow horses to eat hay from an overhead rack as dirt is likely to fall into their eyes and cause distress and sometimes permanent injury.

If you observe closely you will notice that a young colt, when in the pasture with its dam, spends much of its time stretched out on the ground. Like a baby it requires a great deal of sleep.

Horses that are used exclusively on the farm and do no road work should go unshod.

A lazy groom will never fit a horse for the show ring. It takes active muscle to do that.

A bit of linseed-oil-cake once or twice a week will help to improve the coat.

Do not be in too much of a hurry to force a horse's coat to shed in the spring.

Forced shedding exposes the new hair before it is ready to come to the surface and it quickly becomes dry and harsh.

George Washington was the first breeder of high-priced mules in this country.

A mule seldom gets sick more than once and he generally dies then.

A horse that brings $300 at three years of age, pays as well or better than any other animal on the farm.

Better no colt than one from a three-dollar sire.

Pure-bred draft-horses are coming slowly in this country, but they are surely coming.—Farm World.

AMERICANS EATING GOATFLESH.

"Goatflesh will be known as the poor man's meat in America," said a Kansas City trader, who handles it extensively. "When that time comes it will not be vended by unscrupulous butchers in the guise of mutton, but for what it really is, and a healthier and more palatable meat never had a place in culinary operations."

Goats by the hundred-thousand are slaughtered in the United States annually, and the product sent into the food supply. How much of it reaches the consumer as goatflesh can only be conjectured. Among immigrants from southern Europe the meat, especially that of kids, is highly esteemed. It has a venison-like flavor that wins favor promptly and the taste for it has not to be acquired. Naturally a prejudice exists in the popular mind for the reason that the American people have not been accustomed to it, but tons of goat meat are sold every year as mutton. On account of misrepresentation by retailers, one of the principal slaughtering concerns recently decided to kill no more goats.

Kansas City is the world's greatest goat market, killing over 100,000 annually. About 50,000 reach Chicago. Some are marketed after doing a good job as brush cleaners, others have been in feedlots, but the bulk comes direct from the arid ranges of the Southwest, the natural home of the goat.

Missouri has fed goats numerously during the past year and those who handled them made money. They do not put on the same gains that are possible with sheep or lambs, but their cost as stockers is less, mortality is practically nothing and they will convert feed into marketable shape that neither sheep nor lambs would look at. They are gross feeders however. One Missouri man who fed over 1,000 head during the winter voices the objection that they "rear around too much" and their natural habit of restlessness undoubtedly impairs their gain-making capacity.

New Mexico and Texas are the principal goat-breeding grounds of the United States. Possibilities of production all over the Southwest are unlimited. For a year past the Kansas City goat market has been on a 4@6-cent basis and if these prices continue, breeding will receive a decided impetus, as there are millions of acres of land now producing little or nothing that is available for the purpose. Goat raisers have been put into circumstances of comparative affluence by current scarcity of sheep and lambs, which has created a demand for their output at very remunerative prices. In justice to the goatman his product ought to have a place in the market and until it is sold on its merits he will not get his dues.—Breeders' Gazette.

SOUNDNESS IN HORSES.

A serviceably sound horse is one that for all practical purposes is as good in every way as a sound horse, so far as actual service is concerned. He may have blemishes, in the form of wire cuts or something of that sort, but not of a character to interfere in the least with his usefulness or to cause lameness or soreness. He must have good eyes, good wind, and be free from side bones, bad hocks, spavins, thoroughpins, large splints, buck knees, etc. He may have a small splint or two, if located away from the joints, and slight puffs.

We quote below the principal rules which govern the sale of horses in the auction ring:

Sound—Perfectly sound in every way.

Serviceably Sound—Virtually a sound animal, barring slight blemishes which do not interfere with his usefulness in any way. His wind and eyes must be good, but a spot or streak in the eye which does not affect the sight will be considered serviceably sound, as long as the pupil of the eye is good. He must not be lame or sore in any way.

Wind and Work—The only guarantee this carries with it is that the animal has good wind and is a good worker.

Work Only—He must be a good worker, and everything else goes with him. No other guarantee than work.

Legs Go—Everything that is on the animal's legs goes with him; nothing is guaranteed, except that he must not be lame or crampy. He must, however be serviceably sound in every other respect.

At the Halter—Sold just as he stands, without any recommendations. He may be lame, vicious, balky, kicker or anything else. The purchaser takes all the risk. The title only is guaranteed.—Wallace's Farmer.

Little pigs may be kept from danger of crushing by the mother by having a fender made of a scantling, rail or pole securely fastened, say eight inches from the wall, and the same distance from the floor. The pigs will quickly learn the protection afforded by this device when the sow lies down. Some breeders advocate a farrowing pen not large enough for the sow to turn around in, and with walls open eight inches from the floor so the pigs may run in and out. A pen of this sort may be made by confining the sow at one end of her regular pen with boards so nailed that she will be unable to turn around.—From Coburn's Swine in America.

Shearing sheep too closely, even when the weather is warm, is bad practice, as either a chill or a sunscald is liable to result.

Mature sows can raise two litters of pigs a year, but the pigs should not be allowed to suckle for more than eight or ten weeks.

Correct Grinding

of corn on cob is easily accomplished with the

Fairbanks-Morse Steel Feed Mill

The high price of feed makes it important that you do your feeding on a scientific basis. FAIRBANKS-MORSE FEED MILLS are best on account of their light draft, large capacity, strength and long life. They are designed for slow speed, which reduces friction and wear. A 2 H.-P. Jack-of-all-Trades Engine will run one of these mills, crushing ear corn and grinding it fine in one operation. Shelled corn or other small grains, separate or mixed, can be ground fine in one operation. Made in two sizes: Sacking Elevator can be used with either size. *Moderate price; greatest value ever offered.* Send for Fairbanks-Morse Feed Mill Catalog, No. LD 1034 which also shows corn shellers and Fodder cutter.

BEAN ANTHRACNOSE OR POD SPOT.

NEARLY everyone is familiar with the spotted appearance of snap beans, especially of the wax-podded varieties. This all too common disease has been known for many years and a good description has been given of it by Beach and Halsted.

The disease, which is of fungus origin, goes under a number of names, as rust, wilt, pod spot, etc. As there is a true rust and a wilt, caused by bacteria, the name pod spot or anthracnose is preferred for it.

Practically all parts of the bean plant except the roots are subject to attack of the fungus. The most common indication of the presence of the disease is the occurrence of brown or black sunken areas on the stems, leaves, and pods. They may also appear on the seed leaves (cotyledons) and stems of the plant soon after it appears above ground and cause considerable losses through a reduction in the stand. On the older plants the attack is most serious on the larger veins of the leaves, and the leaf may be wholly destroyed or its efficiency greatly reduced. From the stems and leaves the fungus spreads to the pods, and as many are rendered unsightly considerable direct loss is occasioned.

The presence of the fungus is often unnoticed until it appears upon the young pods. On these it produces small brown or rusty spots, which enlarge and darken until they become nearly black. The affected tissues of the pod dry, leaving sunken areas, in the centers of which may be seen small pink spots, masses of spores which rapidly spread the disease from plant to plant. The fungus grows by sending fine thread-like filaments into the cells of the bean plant. When on the pods, these filaments often reach the beans within the pod, and unless they are entirely destroyed the dried beans become a means whereby the disease is carried from crop to crop. This is now believed to be the principal means by which the fungus passes the winter, and this offers an important clew as to means for preventing the disease.

Diseased beans may be recognized by the brownish or yellowish discoloration of the seed coats, and when badly affected the seeds will be more or less shriveled in addition to being discolored. When such seed are planted the dormant fungus resumes its growth with that of the plant and the seedlings are soon affected. Some efficient method of seed treatment should reduce the amount of disease, but none is known as yet. Careful hand selection, in which all discolored, shriveled seed are rejected, will reduce the amount of the disease somewhat, but it has not proved a wholly satisfactory method. A better method is selection of seed while still in the pods.

If no spots are to be seen on the pods, the seed will be reasonably free from the fungus and sound seed when planted will give a clean crop. On this account, extra efforts should be made to secure good seed. It has been suggested that seed be grown in uninfested regions, but dealers can not always be sure of the absence of the fungus from any particular region, the disease having spread to most of the important bean-growing regions.

For the average gardener selection of seed from the growing crop, all spotted pods to be rejected, and care in planting, so as to be away from other areas of beans, will give a clean crop, if a few ordinary precautions are observed. The spores by which the fungus is spread from plant to plant are very sticky when wet and are readily transferred on the hands, clothing, or implements. On this account beans should never be cultivated or gathered while wet with dew or rain. If it is too much trouble to observe these precautions for the whole crop, it could be done with little extra effort for a small plat on which to grow seed for future planting. There is some prejudice in certain quarters against the raising of seed at home, but experiments at the Louisiana Station gave as good results with home-grown bean seed as with that introduced from a distance.

Formerly spraying with Bordeaux mixture or other fungicides was recommended for the control of the pod spot, and if very thoroughly done at frequent intervals it may prove efficient, but in the light of present experience, if the following recommendations are observed, but little loss will result from anthracnose or pod spot:

(1) Plant seed free from disease.

(2) Keep away from the plants while they are wet.

(3) Remove and burn diseased plants as soon as they are observed.
—Farmers Bulletin 388.

FUNGUS ON BERRIES.

Trouble in the gardens of berry growers of Sonoma county has brought out the following correspondence in the Santa Rosa Republican:

A few weeks ago the writer noticed a very unhealthy state of berry vines and bushes of the genus rubus about this part of Sonoma county, near Fulton and Meacham's Station.

The Logan and Mammoth blackberries in particular suffer greatly. The foliage of the bearing shoots is spotted and apparently the red spots drop out, as does the shot hole fungus on the peach and some other trees, so that the leaves are full of perforations, and finally the edges of the leaves turn brown and shrivel.

The bark of the shoots is affected in the same way. The greater part of the fruit fails to fill out properly and is small, sour and of poor flavor, as though the fungus had attacked them also.

The general result is a great falling off in quantity and quality of the crops and a serious disappointment to the berry grower.

A few big bush blackberry plants seemed to be also affected, but the writer has had no opportunity to examine any large planting of that type. The Himalaya blackberry seems very slightly affected so far.

I can't say how far this fungus has spread, but some Phenomenal berries, bought in Santa Rosa, showed some specimens with the white spots on one side, as noted above.

Wishing to get all the light possible

The Ornamental Garden

THE ROSE UNDER GLASS AND IN THE OPEN.

THE statement is frequently made by magazine writers, and readily accepted as the truth by that part of the public unacquainted with the facts that roses may be gathered from the bush growing in the open every day of the year in this wonderful Southland. This is true only in a limited sense of the statement, yet it is made to appear, by this class of writers, that all that is necessary to have a bountiful supply of cut flowers of this, the Queen of flowers throughout the year, is to own a plot of ground in extent according to the purchasing ability of the grower, planted with the various types and varieties offered by nurserymen.

The idea is erroneous, the statement misleading, and the result sure to be disappointing to the novice who undertakes to grow roses by this method, even in this, the most delightful climate of the United States of America.

Pure blooded Tea roses, and there are but a few varieties of that class in cultivation at present, will if given care and left undisturbed in their growth by the gardener and his shears, keep the statement within the bounds of truth, by producing at all times a few blooms; enough at least to show their character, as to color, form, and fragrance. As a matter of fact, here as elsewhere, the season of roses in superabundance, is the first half of the year. Then it is that the two Banksias, white and yellow, hide themselves beneath a mantle of double flowers.

Then it is that the white Cherorkee appears in all its glory. The single type, with its satiny petals, forms chalices of ivory whiteness, filled with a filagree of golden stamens and anthers. The double variety of this species is very much like the "Snowball" of the Eastern states in appearance, except that it is miniature in size, in comparison with the Snowball. Beauty of Glazenwood with its multi-colored single flowers with colors of copper, of gold and of orange, makes a display of gorgeous beauty, which, when once seen is never forgotten, and be it remembered that if given an opportunity these three varieties, will cover trees or buildings to a height of fifty or sixty feet, yet in two short months is their glory departed, and they are not seen again, except in foliage until the return of spring, the season of roses.

Teas, their mutants and their hybrids, also make a greater display at this season than that of any other time of the year. A greater or less quantity will be produced by this class, during the autumn, if given proper attention during the summer months, and the temperature of the atmosphere does not fall below forty degrees Fahrenheit at night.

One of the essentials to this highly desirable end, an abundant crop of fine flowers during the autumn and early winter months, is to rest the bushes during July and August. Even then the quantity and quality will be affected by favorable or unfavorable climatic conditions.

There is another factor, other than that of climate, which governs the productivity of a rose bush grown in the open, namely, the manner in which the flowers are cut, with or without long stems. The leaves of a plant bear the same relation to it, that the lungs of an animal bear to it—indeed it is no exaggeration to say, stomach too—since it is by them that the food, which is brought to their surface in the sap, is digested and made ready for assimilation by the plant. To cut a flower with a long stem, the foliage will go with it, and in proportion to the amount of foliage removed, will the plant be debilitated. Moreover the low relative humidity of our climate is not favorable to rapid recuperation of the enfeebled subect, and in its weakened physical condition the plant is unable to use the elements of plant food, be it ever so liberally provided by the enthusiastic and industrious rosarian.

The question will naturally arise in the mind of the gardener—Wherein is the difference in conditions between growing roses under glass and in the open, in this land of practically perpetual summer? The soil, the water, the fertilizer, the skill and care on the part of the gardener, being the same in both cases, why should there be any difference in results? The answer is, the difference in climatic conditions. As previously stated, a plant is weakened and debilitated in proportion to the amount of foliage taken from it. A climate of low relative humidity is not conducive to luxuriant growth of vegetation and the rapid recovery of mutilated plants. The climate of Southern California is of that class and character. The remarkable record of six per cent for one hour last year, and from ten to forty per cent relative humidity was of frequent occurrence as recorded by the instruments at our weather bureau; yet there are intelligent, industrious commercial growers of cut-flowers in this southland, who spare neither labor nor expense to secure good crops, and wonder why their bushes, after a year or two, cease to be profitable, or die outright. To the question that arises in their minds, and frequently is put to their fellows in the craft—Why this failure?—Why don't we succeed as do the growers who have their plants under glass?—the answer is, the lack of moisture in the air. No matter how much moisture may be in the soil, if the atmosphere be dry, it does not meet the requirements of the plant. The skillful rosarian with his plants in a glass house is able to control climatic conditions which surround him. By the liberal use of water in the walks, the syringe or spray from the nozzle on the hose, a humidity of eighty-five to ninety-five per cent is maintained the year around.

Visitors to rose growing establishments in California will observe that the doors are never left open—no matter what the temperature may be on the outside. To do so would admit the dry atmosphere, lower the humidity within, and thus defeat the purpose for which the houses were built; the maintenance of a high humidity, also an even temperature throughout the day, and that too every day of the year, which is an essential to successful rose growing. The careful observer will note, too, that a range of temperature between midday and midnight in this section of the state is usually about twenty degrees. Thirty degrees is frequently the record. During bright days the thermometer may show eighty-five degrees at noon, and between midnight and five A. M., a temperature of fifty or fifty-five degrees. Because of such conditions a glass house must be equipped with heating apparatus, here as in the Atlantic States, that a temperature of sixty-five may be maintained at night, to produce cut flowers successfully, and at a profit.

Appointment of Horticultural Commissioners.

Along the line of an editorial in a recent Cultivator, we wished further information as to conditions, so wrote State Commissioner Jeffrey and he explains the situation so well that we give it in full:

You ask for my opinion upon the status and the utility of the new law governing the appointment of county horticultural commissioners. In the main it is a great improvement over the old law, and in several counties it has vastly changed the character of the service and revolutionized the methods of orchard protection; in others the Supervisors have neglected or refused to appoint under the new act preferring to let the old boards drift along in the old channels and temporarily nullifying the provisions of the amended law. Twenty-seven counties have appointed each a commissioner in accordance with the act of the last legislature, the Supervisors of three counties have refused to make appointments and in several other counties the examinations have been held so recently that the Supervisors have not had time to act.

In Imperial county the Supervisors have been advised by their District Attorney that the Board of Horticultural Examiners should have added three names by selection to the list of eligibles, inasmuch as only two qualified at the examination, the District Attorney holding that the new law requires five eligibles to be submitted before the Supervisors can act. This advice is contrary to that of the Attorney General of the State, whose opinion states that the Board of Examiners can only certify to names by selection where no one qualified at the official examination. The Attorney General's decision has just been upheld in Fresno county, where only one man qualified by examination. The Supervisors refused to appoint. Upon presentation of the case the Superior Court issued a writ of mandate ordering the Supervisors to appoint the eligible who had passed the examination. They made the appointment at once.

Another case of delinquency is in Santa Cruz county, in which the Supervisors made the appointment according to the new law, except that they required the appointee to sign an agreement to accept only such compensation as they might allow and bind himself to vacate the office at any time the Supervisors should demand it. Both these and all similar requirements are contrary to the plain reading of the new law and it is stated that the Supervisors will recede from these conditions. In San Benito county the officials have refused to appoint, upon what grounds I do not know.

The law should stand as it is until amended by the fruit growers of the state. If the officials charged with the selection of horticultural commissioners are imbued with the desire to promote our greatest soil industry the law is ample, authoritative and established by a universal line of favorable court decisions. Its one great defect lies in the fact that it does not in so many words provide a revenue for the maintenance of the horticultural commission. An attempt was made to reach this defect through a county government act by classifying each county and fixing the salary and providing a revenue as is done in other county offices. The last legislature did not undertake a county government act, so the old law was amended as we now have it. In every county where the growers are alert and insistent upon protection of their interests the new law is most satisfactory and it will not be changed till a more effective enactment is offered by the farmers and fruit growers of the State.—J. W. Jeffrey, State Com'r Horticulture.

Frost Protection.

The Cultivator has in hand material for an excellent special issue on protection of our crops from frost. Perhaps weather conditions at this moment are not such as to remind the fruit growers that California ever is visited by Jack Frost, but a few growers' memories may be long enough to recall December and January last. We trust they are also long enough to recall that in some sections some fruit growers have secured immunity from injury and have saved thousands of dollars by a little forethought and preparation for the coming of this unwelcome visitor. California has some "frostless" sections, but they are usually made so by the effort of the growers. The finest fruit in the world is grown in sections where frost may occur and the grower who will not prepare to protect himself deserves the punishment which is sure to come. This is the time of year to look ahead to the colder months and to begin preparation for them. A few hundreds of dollars spent wisely may save thousands.

The issue will appear next week.

Who Gets the Difference?

It has been stated that the retail price of lemons in the stores over the East varies but little with the seasons. A few years ago when lemon growers were receiving anywhere from red ink to a dollar a box, the consumers were paying practically the same per dozen for lemons that they do today, yet there is an effort to lay the increased cost of living at the door of the farmer. If the question were asked as to why this is so, that today the lemon grower is securing good returns, in some cases exceptional returns, we believe it could be answered by the one word, co-operation. Formerly lemons were the legitimate prey of packers and shippers, used as they saw fit to make immense wealth. Today the lemon grower is using shrewd business methods in the marketing of his fruit, employing his own business men to put the fruit into the market so as to secure best advantage. When lemons were selling in the East for $2.00 or $3.00 per box, the buyer paid from 25 cents to 40 cents per dozen for exceptionally nice fruit. Today with some sales as high as $9.00 per box, they are still buying at 40 cents, with lower grades cheaper. With 30 dozen to the box, it can be readily seen that there is still good profit for the retail dealer.

We recently purchased some good bulk raisins at retail for fifteen cents a pound. The raisin producer in the San Joaquin Valley is feeding his raisins to the hogs or selling for two and three cents. The difference is too great. The lemon grower is organized and co-operates; the raisin grower is disorganized and unable to stand with his neighbor.

Moral—but a moral is not in good form, and it is too obvious to refer to in this case.

Power Sites Withdrawn.

President Taft has recently withdrawn from entry nearly eight and a half millions acres of lands on which there are possible power sites and phosphate or petroleum deposits. The President has also appointed engineers of the army who will constitute a board to pass on the reclamation and care of these lands. This is provided for in the appropriation of twenty millions already made. These are the first withdrawals under the new law. President Roosevelt's action along this line was not under the law, but on the theory of the right of the executive to do anything in the interest of the public domain which is not prohibited by law. The water power sites alone cover a total of 1,415,490 acres. Of this, 647,000 acres are in California, 107,000 acres in Arizona, 176,000 acres in Oregon, and 55,000 in Washington.

Consulting Engineer.

Secretary Ballinger has appointed Wm. L. Marshall, recently chief of engineers of the army, as consulting engineer in the reclamation service. It has been persistently rumored that this would mean the ultimate retirement of Director Newell and equally as emphatically denied that such action was contemplated. Should Director Newell be retired, it would cause great disappointment over the West. It is understood that this appointment of Mr. Marshall is entirely acceptable to President Taft.

Farmers Institutes.

J. B. Neff, conductor of Farmers Institutes of Southern California, announces the first fall institutes as follows: Los Alamos, Santa Barbara county, Aug. 7, Los Olivos, Aug. 2; Santa Maria, Aug. 3; Nipomo, San Luis Obispo county, Aug. 4.

With walnuts growing satisfactorily and with trees more heavily loaded than for some years and good prices promised, together with a strong co-operative marketing organization, walnut growers are feeling pretty good this year.

Isolation, hard work and small compensation is too often the lot of the farmers' wives. These are burdens that need lifting.

The greater the number of prosperous farmers, the greater will be the prosperity of every business man.

Agricultural News Notes of the Pacific Coast

Northern California

Cloverdale wool growers have sold much wool at 18 cents.

A new fruit shipping house is being established at Placerville.

Almond Growers Exchange has rejected bids for its coming output.

Deer are more plentiful in the mountains of Shasta county than ever.

Tomatoes from Lincoln, Placer county, commanded two dollars a box in Portland.

The cannery at Haywards, Alameda county, has opened with many improved appliances.

Contra Costa county will vote upon the question of a million and a half of bonds for good roads.

A big tract of land has been subdivided and will be sold in ten-acre tracts at Arno, Sacramento county.

Gardens near Corning, Tehama county, will ship 10,000 crates of tomatoes to Oregon and Washington.

The shipments of fresh fruits from the Sacramento Valley are almost 400 cars in excess of last year at that date.

Oroville hopes for the construction of an armory which will also afford exhibition room for a citrus exposition this fall.

The forestry service has a nursery for experiments with range grasses in the Klamath National Forest. Siskiyou county.

Placer county feels that she is getting the best of the mosquito pest on which a continuous fight has been made for some weeks.

Less than half the spring clip of wool has been sold by wool growers of Mendocino county. Prices have ranged from 15 to 19½ cents.

Farmers have secured the closing down of the big copper smelter at Winthrop, Shasta county, until smoke consuming device is installed.

Another fire to burn up a bunch of grasshoppers at Biggs, resulted in adding two stacks of hay and several grain fields to the conflagration.

The hickory and black walnut trees being tested in the Shasta National Forest reserve in Siskiyou county, have been seriously injured by frost.

An alfalfa grower at Elverta, Sacramento county, has lost twelve acres of alfalfa through the hunger of grasshoppers which completely cleared his fields.

The $300,000 change in the copper smelter at Kennett, Shasta county, has been completed and the farmers hope for complete control of the destructive fumes.

Owing to morning glory seed and other pests, large grain growers near Yuba City, Sutter county, have harvested their grain early and will thresh with the old style stationary threshing machine.

The American Olive Company of Los Angeles asserts that its shipments of California ripe olives have never been labeled "Southern California Olives," but go out simply as "California Olives." A large portion of these are bought at Oroville, Butte county.

Central California

Porterville is to have a new orange packing house.

The Turlock cannery will open about July 10th.

Farmers at Corcoran are busy installing rural telephone system.

Stockton is the latest with an agricultural course in its high school.

Tulare county bee-men are making a strenuous fight against foul brood.

San Joaquin Valley is to have better transportation service for its green fruits.

Tulare county bee-men report very small crop, but hope for big returns from the reduced output.

A mass meeting of farmers under the Modesto-Turlock Irrigation Ditch was held at Modesto last week.

A couple of Frenchmen recently arrived have installed an extensive mushroom plant at Santa Clara.

Porterville claims she is receiving satisfactory advertising because of her attitude, "No Japs in this town."

The Fresno County Agricultural Association has decided to hold its next annual fair the first week in October.

Mr. W. E. Sprott who has been manager of the Tulare County Fruit Exchange, has been endorsed for another year.

The United States Geological Survey is finishing detail drawings of the Sierras of eastern Fresno and Tulare counties.

The first car load of dried apricots out of Kings county was about the end of June and is said to have been the first in the state.

The Calfalfa Cream and Butter Co. has filed articles of incorporation with the clerk of Stanislaus county and will establish a creamery at Turlock.

One of the Cultivator field men working in Kings county reports that Hardwick has promise of being one of the most up-to-date little towns in the state.

The board of directors of the Tule River Citrus Association elected for the coming year are: W. E. Sprott, Henry Anthony, Frank Wilson, Hobart Webster, F. W. Velie.

Many Kings county bee-men have sold their extracted honey at six cents a pound. The output will be between six and eight carloads. The price last year was four and a half cents.

Some Kings county ranchers have tried the experiment of drilling alfalfa seed instead of the usual broadcasting, one farmer drilling 160 acres. It has proved remarkably successful.

A Cultivator representative working at Lemoore writes; "If you want to see busy people, come to Kings county and watch the apricot growers. The crop here is fairly heavy this year."

The sugar factory at Spreckels, Monterey county, has nearly completed its overhauling, and is prepared for the biggest crop of beets which has been produced in Monterey and Santa Cruz counties.

Southern California

Cotton prospects of the Imperial Valley are the best.

Redlands had a serious field fire caused by sky rockets.

Riverside Driving Club will give races on Thanksgiving Day.

La Habra, Orange county, reports grain and hay output larger than last year.

Imperial Valley grape growers are receiving as high as $50 per ton for table grapes.

Garden Grove, Orange county, reports beet crop fine with promise of large tonnage.

The site has been purchased for the Anaheim sugar factory and work will begin at once.

Firebreaks which have been constructed in the San Bernardino mountains are declared to be in excellent condition.

The warm spell of last week did but little damage to the orange crop and the estimate now is for a very large crop.

Lemon growers say this is one of the best years they have ever experienced as to prices. The output has been light.

The butterfly pest in the alfalfa fields of the Imperial Valley is so serious that concerted action will be taken to eradicate it.

Farmers of Imperial Valley are elated over the million dollar appropriation which will make possible the control of the Colorado.

A banquet was tendered to G. Harold Powell of the Deparment of Agriculture by fruit growers at Riverside during his visit to that city.

The grape marketing season is on with the grape growers of Coachella Valley, Riverside county. Most of the growers co-operate in the marketing.

A thorough examination has been made of the Little Bear Valley dam by engineers who report there is no danger whatever of the dam giving way.

The voters in the Newport section of Orange county have formed a drainage district comprising some 300 acres of land. A bond issue of $25,000 will be made.

There is an effort being made to put out the so-called winery which has been operating for years in Chino, San Bernardino county. It is charged that the winery is more of a booze joint than a legitimate winery.

Nothwithstanding part of the orchardists who have properties near the Colton Cement Works have settled their differences, many others are still contending for remuneration because of damage from dust from the works injuring trees.

Orange county apricot drying camps have closed down. The ripening of the fruit was much earlier than heretofore. The shortness of the crop may be judged by the fact that one camp which last year had 70 to 80 pitters ran this year with from six to eight. Most careful estimates are that crop will be less than one-third of normal. Buyers are offering eight cents, but all growers are refusing less than ten.

The Coast

Seattle is shipping extensively of Bartlett pears to Alaskan ports.

North Yakima will ship carload lots of peaches to Atlantic Coast points.

Quotations on fresh candled ranch eggs at Portland, Oregon, are 27 cents.

Alfalfa seed growers of Yuma Valley, Arizona, propose to standardize their output.

It is now estimated that it will be fully two years before Arizona becomes a state.

The Montana hay crop has been almost entirely ruined by adverse weather conditions.

A pre-cooling plant has been built by the fruit interests of North Yakima, Washington.

A forest fire at Maco, Arizona, extended over 50 miles of mountainside and destroyed a ten-stamp mill.

Three thousand acres will be brought under irrigation by a development scheme near Bonanza, Oregon.

A rumor started that the great Laguna Dam was in danger of immediate destruction, was without foundation.

The governor of Moro Province, Mindanao, Philippine Islands, has asked for 75,000 pesos for irrigation canals.

Farmers of Gilliam county, Oregon, have formed a co-operative farmers union for buying supplies and selling products.

The Interstate Fair and Exposition will be held at Denver this fall and promises especial attention to irrigation topics.

Experts are studying the life and habits of the "rhinoceros beetle" which is infesting the cocoanut trees of the Philippine Islands.

Agriculture in eastern Washington will be given an uplift by the recent ruling of the Interstate Commerce Commission for a 25 per cent freight reduction.

An agricultural school for the pagan children of the Island of Mindanao in the Philippines is planned at Zamboanga. It will take boys from twelve to twenty years of age.

A combine of power plants has been formed by the most extensive public service corporations of the Northwest, in a corporation with seven and a half millions of capital.

The Yuma Indians do not like their allotments under the Laguna Dam irrigation scheme, and will send a committee to Washington to place their grievances before the President.

The large sugar plantations of the Hawaiian Islands which are now held by large interests under merely nominal rent to the government, are to be sub-divided and made accessible to homesteaders.

Owing to shortage of labor in the grain fields of the Inland Empire of eastern Washington, farm hands are organizing a labor union and demanding $3.50 for eight hours work. Sack sowers and forkers are demanding $5.00 a day, and machine men $10 to $12 a day.

Coulson's

EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying power and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Get it at your dealer's; anyway send for our Catalog which tells about the familiar Coulson Products and gives valuable information about Poultry Raising.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

CARE OF YOUNG TURKEYS.

To begin at the beginning it is necessary to see that the eggs are properly cared for, because if they get chilled or remain too long in one position, they will not hatch.

Turkey hens, as a rule, lay their eggs on the ground. As they always begin laying very early in the season, it is best to remove the eggs from the nest, soon after they are laid, and replace with hen eggs.

Be careful not to let a turkey hen see you near her nest, because turkeys are very cunning and resent intrusion. We wrap the eggs in paper, and place in boxes, one layer deep. They are carefully turned every day, until placed for hatching. We have kept turkey eggs for four weeks in this way, with good results. But it is not advisable to risk keeping the eggs so long, when one can do otherwise. We never tried hatching turkeys in the incubator, because they would have to be kept in a brooder at first, and we do not think they would thrive.

The only advantage in hatching with chicken hens is that by so doing the turkey hens can be induced to lay several clutches of eggs in a season.

Year before last we hatched some of our turkeys with chicken hens, but will never do so again. The hens were set in fresh nests, placed where no other poultry had been kept, but the poults got very lousy and, in spite of the fact that they were thoroughly dusted with louse powder, every few days, they began to droop and die. The "louse killer" would not kill lice, but it made the turkeys sick every time it was used. Perhaps it was because it was bogus or had lost its strength. At any rate, it merely drove the lice from one place to another; wherever the powder failed to reach the lice were most numerous. As a last resort, after several of the poults had died, we began to use olive oil. Too much oil or grease will kill young poultry as fast as lice will, and sometimes faster. Some people use fresh lard but we prefer olive oil. The poults were carefully examined, and a very little of the oil was rubbed on, whereever lice were found.

Between the large quills on the outside of the wings, the lice were found in bunches. This is a favorite hiding place. Spread the wing and raise the short feathers on the "shoulder" or outside of the wing, directly over the large quills. If a young turkey has lice they will be found here. Also around the tail or wherever there are large feathers. One application is usually sufficient, unless the lice are very numerous. It is sometimes hard to locate lice, even when one is sure that they exist. The symptoms of lousiness are easily detected. The poults appear uneasy and often take fits, wheeling round and round. Sometimes they look pale and withered about the head and shanks, their wings droop and they refuse to eat. Our turkeys are never troubled much with head lice, but it is well to examine their heads, especially when they are first taken from the nest. A very little olive oil or fresh lard will kill all the lice and nits. But if none are found it is not advisable to use the oil. It is not a preventive and must reach the infested spot, in order to do the work. Never use kerosene or anything of the kind for lice. And, here is another bit of advice: Never use oil or grease of any kind upon a sitting hen. If she has lice use a good louse powder or sulphur. Oil or grease upon the shell of an egg renders it worthless, so far as hatching is concerned.

Last year we hatched and raised all our turkeys with the turkey hens and, for the first time in all our experience with turkeys not a louse was found during the entire season.

Those who have tried keeping young turkeys in small coops know that they seldom thrive. This is because a turkey cannot endure dampness or foul air. It is next to impossible to keep a small coop dry and clean in wet weather. Last year we kept our turkeys in a house. It was not originally intended for a poultry house, but it answered very well for the purpose.

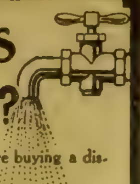
The house is 16x36 feet and is built upon a foundation of stone. There are two doors and four large windows. We put wire screen on all of the windows and doors, so that the poults could have plenty of fresh air at night, and also when kept indoors on rainy days. The building was made rat proof and whitewashed inside. As soon as the turkeys hatched they were taken from the nest, placed in a basket and then placed where they could have the benefit of the sun. Few turkey raisers realize that one of the first things that a young turkey requires is sunshine. It is time wasted to offer young turkeys food before they are forty-eight hours old.

The turkey house was arranged so that each turkey hen and brood had a separate apartment. The hens were placed in the house as soon as the poults were removed from the nest. The reason why we adopted this plan is that it prevents the poults being crushed to death in the nest, and also gives the hens a chance to get a little exercise sooner than they otherwise would.

As we are always careful to have the floors well covered with litter, it is easily kept clean. All doors should be left open to admit sunshine and fresh air. In very warm weather we opened the windows also. Turkeys cannot thrive without fresh air, both day and night. We found it very convenient to leave the doors and windows open and fasten the screens at night in hot weather.

The first feed is usually eggs, boiled hard and crushed, mixed with dry bread crumbled fine, then sprinkled with clean, coarse sand. Rice, when properly cooked, is good for young turkeys. The grains should be dry and separate. Chopped onion tops or dandelion leaves are added to the rations when turkeys are kept indoors; onions are added occasionally, even when the turkeys have free range. They are always relished,

How Much Is Water Worth?



Water is very expensive if you are buying a disinfectant that is half water.

Coulson's CRESOLENE

is a powerful disinfectant and germicide made from coal tar. You add the water yourself to make the disinfectant desired strength. COULSON'S CRESOLENE must be diluted from 20 to 100 times its own bulk. It is not poisonous—more powerful than copperass, cloride of lime and other well-known disinfectants. It forms a milky emulsion that only costs 1 1-4 cents a gallon. It is the cheapest disinfectant on the market and at the same time the best. Use it on stock—poultry—dogs or as a general disinfectant and insecticide.

If your dealer does not keep it, order direct from us. Quart cans—50c. Gallon cans—$1.25. Freight free on gallon orders.

When writing advertisers, mention Cultivator

and we think they help to keep your poultry healthy. Pinhead oats or what is known as coarse steel-cut oatmeal, is better for young turkeys than corn. An occasional feed of corn bread is given for a change, but they are never confined to it. Corn is too fattening for growing turkeys. Wheat is good after they are six weeks old.

Over feeding is one thing that must be guarded against. We have always been inclined to feed too much and too often. When turkeys have plenty of range they require very little grain.

Last year we lost only two poults from disease. They died of indigestion, caused by over-taxing of the digestive organs. They were about the size of quails and had been growing well, when suddenly they got sick and died. It was discovered that they had bowel disease, and we at once decided to cut off the evening ration. We had been feeding twice a day. A little steel-cut oats morning and evening was all that they had been getting besides the insects, etc., found in the fields. However, we had noticed that their crops were very full when they came in every night. But as they always looked for feed, we never suspected that they were being over-fed until they began to die.

A turkey is a very greedy fowl and will eat whenever feed is offered, even if his crop is already full to bursting.

The evening ration was discontinued and that was the end of the trouble. No more turkeys died or showed any signs of disease. We raised the finest flock of Narragansett turkeys ever seen in this country. Our turkeys are always provided with plenty of pure water, charcoal, sand and other grit. No condiments are used.—St. Jo. Fruit Grower.

POULTRY QUERIES.

Enteritis.

Will you please tell me through the columns of the Cultivator what is the matter with my young chickens? They are about three months old; when they begin to be dumpy, droop, become very thin and finally die. On examination I find all the organs to look natural except the gall sac, which is enlarged about three times the natural size. We have about half a dozen affected thus, mostly pullets. Is the disease contagious.—Mrs. E. A. Martinez|

The symptoms suggest enteritis in some ways, which is a contagious disease according to some writers, but my opinion is that it is rather epidemic than contagious, and that the causes which produce it, will affect the entire flock just in proportion to their condition for "taking it." In short, it is like typhoid fever, and may be caused by impure drinking water, or unsanitary surroundings, as well as unsuitable food. In true enteritis the intestines are filled with mucous after the disease has run a certain course, and the absence of this symptom may mean that your birds simply have enlarged livers from too rich food and too little exercise and green food. Not knowing how they were fed, and how closely they were kept confined I can only guess at the probable cause of the trouble, but my own experience has been that where they were kept confined, fed too much grain and too little green food, and especially where they were not obliged to exercise in some way, that liver trouble of some sort was sure to follow. The cure is a teaspoon of castor oil or a liver pill to each patient, followed by a light diet. Charcoal is necessary in some form, but if one makes a mash too dark with it, they refuse to partake of it, so a good way is to toast bread until it burns slightly, and soak this in lime water, then beat up a raw egg and mix in it for a feed or two. Put baking soda in the drinking water, a teaspoon to each pint, and if possible to give them a clean grass run, do so, and if not procure green food of some sort in plenty. Clean up the premises thoroughly, inside their coops and out, and keep clean for prevention is better than cure, and especially be careful about letting the drinking water stand in the hot sun until foul. We all love a fresh, clean drink and should see to it that our chicks have fresh water several times a day this hot weather.

Dr. Sanborn says that nine-tenths of the liver trouble of chicks is due to giving a ration too rich in starch elements, and that too much white bread is one great mistake many people make in feeding young chicks. Boiled rice is said to be excellent for sick birds, but a standby of my own used to be raw egg and bran. The raw egg seemed to relieve the congestion and the bran was filling without being concentrated. The loose leaves from the hay mow where alfalfa is fed, is excellent, if boiling water is poured over a pail full and it is allowed to stand covered closely, over night. They eat this greedily, and it contains all the elements needed save a little meat or granulated milk. And they cannot overeat of it. Try it.—Mrs. Frank Metcalf.

Roup.

My chickens start with a little foam in the corner of the eye, then the nose begins to discharge and eyes get worse, swelling up and sticking together with white discharge. It is roup? I use coal oil in nose and throat and wash eyes with boracic acid, also permanganate of potash; put blue-stone in the water.—Subscriber, Orange.

My advice would be to do rather less than more in this case. As you have tried all the other cures, now mix 1 ounce listerine with 2 ounces of peroxide of hydrogen and bathe the head and eyes freely with this. Then give each bird a dose of quinine suited to its age, a full grown bird being able to stand one grain and younger birds in proportion. Should there be a rattling in the throat, give five drops of oil of eucalyptus on a lump of sugar, and feed soft mashes for a few days, composed mostly of bran and cornmeal, and seasoned with pepper pretty warmly. After they are cured, fatten them for market, and never use any of their eggs for hatching. The question that naturally arises now is, Of what use is it to fuss with them at all? You don't want to eat those birds yourself, and you surely would not offer for sale what you consider unfit for your own table, so unless you wish to keep them just for the eggs they lay for the table, (which eggs will be wholesome after they are perfectly well, and they won't lay before), use the hatchet just as soon as the eyes swell shut. Then clean out and disinfect your whole chicken plant, plow the ground and sow some quick growing crop like barley on it, and give the birds range on other soil until this is done, if possible. The growing crop sweetens the ground as nothing else can do, but if impracticable, then remove several inches of the top soil, and replace with fresh dirt or sand. Be sure not to crowd the birds at night, as they get too warm and take cold upon being released in the morning. Besides, too much heat at night weakens their constitutions as nothing else can do.—Mrs. Frank Metcalf.

Producers of prunes in Santa Clara Valley are hopeful for a most satisfactory season.

2000 WHITE LEGHORN HENS, $10 PER DOZEN
RIGHT NOW

We have 2000 White Leghorn hens and pullets contracted for. Most of them are 10 months old; as long as they last we offer them at $10 per dozen in dozen lots and we pack and ship them anywhere. Cocks are $2 each.

These hens and pullets are all young and are standard stock, all are pure white and healthy. If you need hens or pullets of the White Leghorn, right now is the time to get them. By September they will be selling at $1 each or more and will be practically impossible to obtain.

We are selling three-months-old Buff Orpington pullets and Rhode Island Red pullets at $9 per dozen. Write us for any kind of grown poultry. FREE 32-page book mailed on request. We are still selling 10,000 chicks per week.

BUSINESS AND BUSINESS EDUCATION.

By W. E Gibson, Pres. Polytechnic College, Oakland.

BUSINESS is the objective of modern life — the most stupendous paymaster the world has ever known. The volume of business is growing at a prodigious rate and if it is to be continued it must be conducted by trained minds. Business embraces every form of commercial activity, and its branches reach out to encompass the supreme problems of gigantic development as well as most minute detail in the humble office.

The most important business in the world is the preparation of young men and women to carry on the enterprises of the future, and the more thorough the preparation just that much is the measure of success. One cannot hope to combat the problems which are ever present if there has been no forethought, no preparation to meet the many contingencies which are continually arising in the commercial world. The many failures which are daily recorded against men and women may, in most cases, be traced to neglect of early life. Opportunities lost can never be recovered. The neglect of a business education will stamp itself indelibly upon the career.

In the past much of the so-called "education" has been acquired by studying what men have done who have long been absent from the present day world and its affairs. History of the human race; study of languages which have passed from current usage, and which are now called "dead languages"; analysis of a system of logic or the miscellaneous writings of other dead and gone men, have been called "education." A modern education is absolutely essential to a successful life, and the degree of success which is attained will depend largely, if not entirely, upon the kind of education which is secured. The learning of the past cannot be applied to the duties of the present. A business education gives young men and women the strongest weapons for the battles of life.

Business colleges, if properly conducted, serve as a great clearing house between the world of business and those who aspire to immediate employment and futures filled with opportunity. Our schools take the raw material of youthful energy and intelligence, and transform it into the scientifically trained business people who make business the success that it is. They weave into the minds of students the essentials of business as the manufacturer of cloth weaves his product from the raw material. A business education is to be preferred to any other form of education, because of its practicability. It is an insurance policy against adversity—an investment whose dividends are always paid in cash in any community.

The business college is a modern institution. "It originated in this country as a protest against the inefficiency of our system of education; as a protest against the failure of our American schools and colleges to fit young men and women for the business of life. These business colleges, if thorough, furnish their graduates with a better education for practical purposes than Princeton, Harvard or Yale." The real, practical, serious business college is, in reality, a commercial office embracing the various departments of business activity. It does not include merely one branch of business, but shows how each separate business is connected with every other business with which it is likely to come in contact. By instruction in the various branches of business the young mind is taught to grasp principles which are fundamental in every avenue of commercial activity. These principles form the foundation upon which every successful career is built and without them the young man or woman must grope blindly in the hope of finding something which may be mastered by the tedious process of unassisted application.

The young man or woman who desires to enter business, must have his card of admission. This consists in a mastery of business as it is found practiced in commercial houses throughout the world. While there may be differences in detail, the main features are the same in all offices.

Every young man and woman who has given the matter even the slightest consideration must have observed that there is a constant army of unemployed. They have missed their mark and lag in the world helpless, wretched and hopeless. The future offers nothing for them in the way of comfort and happiness. They have nothing to which they can turn their hands, for they were not trained to do the things that the world is anxious to pay to have done.

The one serious problem in young life is to get an education which will be of practical value, something that can be turned into the necessities of life, something that will make each one a useful factor in the world's progress. As the athlete trains for the field day events, so should the young men and women of today train for the many opportunities which are always waiting the one who is capable of grasping them. There are greater opportunities today than ever before. New enterprises are constantly coming into existence and the old ones are growing larger, requiring more employes to handle the business. The young man who can step into the position and at once grasp the situation is worth vastly more than the one who has to be accepted and taught the principles of commercial practice.

It is the duty of every parent to see that his boy or girl is given an education that will be of bread-winning value. No parent should handicap his children by a lack of knowledge. The demands are great at best, and with a lack of business ability there is but small chance of ever rising in the business world.

The term "business" is too often applied solely to city work, it is used to mean the office, the factory, or the shop. But there is a vast need of business on the farm. The man who tries to conduct his farm without knowing the principles of business is like the sea captain trying to navigate without a compass. Business tells which way the farm is going—whether for profit or loss. It enables the manager to stop the losses and increase the profits. It gives an exact accounting of every department and tells which part of the work is the most profitable, and which should be abandoned as non-paying. Whether you want your boy or girl to remain on the farm and take up your work, or whether you want them to enter the city, you should not fail to give that business training which will enable them to be of the greatest value.

Give the boy and girl a chance.

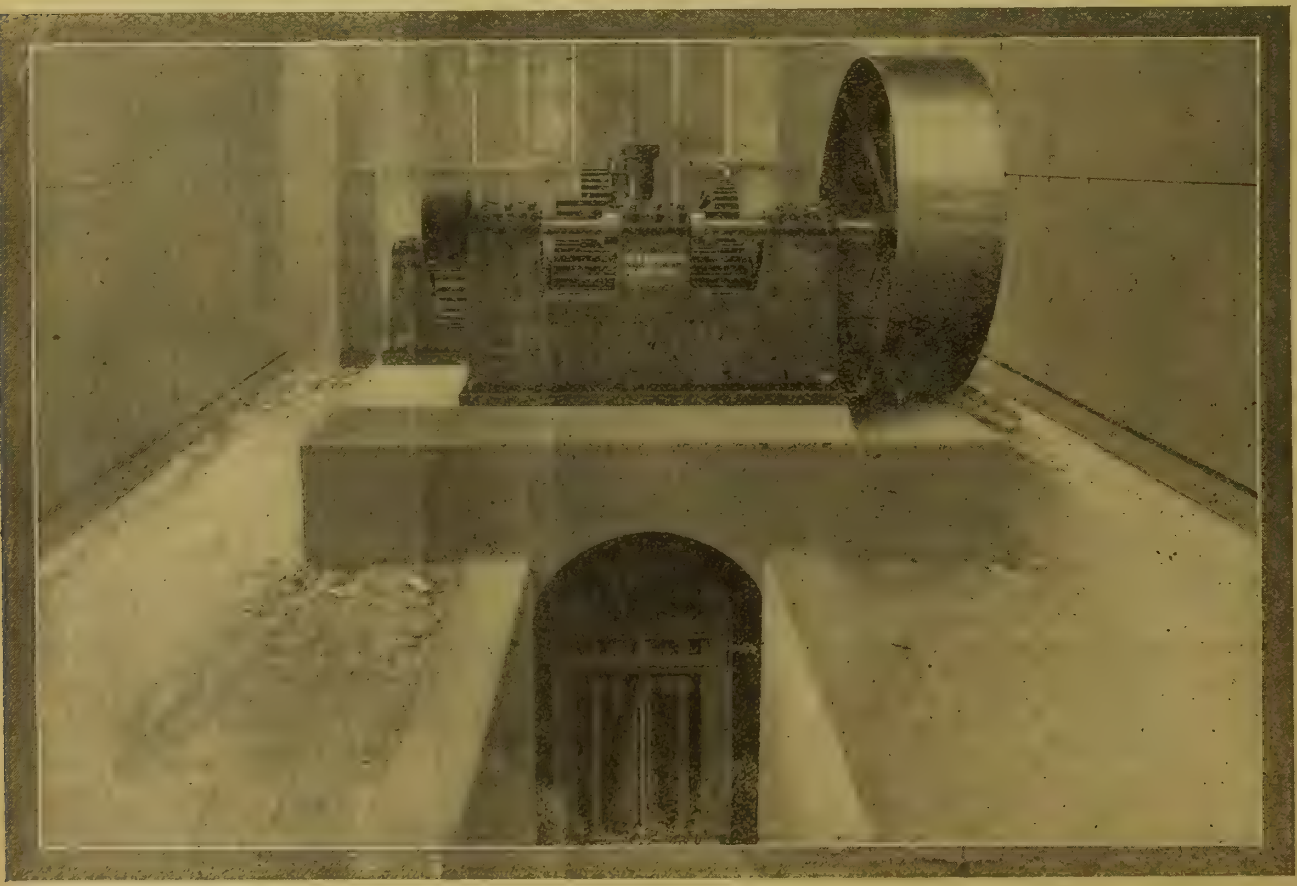
FLY RE-CHRISTENED.

"White Plague Fly" is the cognomen applied to the so-called "Typhoid Fly" by Professor William B. Herms, promoter of anti-fly campaigns, in describing the activities of musca domestica and proposing simple relief measures.

Apropos of this subject Professor Herms says: "The old theory that tuberculosis infection is chiefly caused through germs being borne on the air to the lungs has been displaced by recent investigations which prove clearly that the tuberculosis germ most commonly gains access to the human body through the walls of the digestive tract and is carried in the blood to the lungs or other vulnerable organs. In view of this fact, and in view of the house-fly's long established record as a carrier of disease germs of food, the title 'White Plague Fly' may be justly added to the long list of hard names already applied to this industrious pest.

"The flies will be too many for us so long as we do not prevent them from breeding. This, fortunately, is a simple matter. About 95 per cent of all our common house flies breed in manure piles; the rest in unscreened toilets, uncovered garbage cans, scattered horse droppings, any place, in fact, where moistened filth is accessible to flies. Fortunately the fly seldom travels more than a block or two from its place of breeding. Thus the neighborhood or the town that provides fly proof bins for all manure, and either covers or screens or cleans all other places of breeding will have a flyless summer time."

Here is Another Electric Driven
AMES PUMP
We make Pumps for every service where the source of supply is either a Bored or Dug Well and the lift is from 20 feet to 2000 feet to the surface.



With a lift of from nothing to 2000 feet above the surface through from no pipe to 20 miles of pipe above the surface, an Ames Pump will deliver a continuous stream from lower end of cylinder in well to point of discharge. Write for our catalog.

Irrigation and Forestry

GREAT RECLAMATION PROJECTS OF COUNTRY.

SUPPLYING moisture to semi-arid and desert lands by artificial means is a problem of world-wide importance. It was practiced by the Arabians, Egyptians, Assyrians and Chinese long before the advent of Solomon, and it has since formed a part of the agriculture of the countries bordering on the Mediterranean sea. The ancient art had its origin in America in pre-historic times, with the Pueblo Indians, who inhabited portions of what are now New Mexico and Arizona, and their descendants were still cultivating the lands when the first Spanish colonists came from the south, several centuries ago.

A census today would show fully 250,000 farms in the United States under ditches, watering more than 15,000,000 acres of land. Colorado leads in the number of acres irrigated, California has the largest number of irrigators, while Washington has the greatest percentage in the number of irrigators. The science is also practiced in Canada, England, France, Italy, Japan, the Argentine, South America, Algeria, Australia, Switzerland, Belgium, Denmark, Bohemia, India, Spain and Scotland. It is estimated that more than 75,000,000 acres are under irrigation throughout the world.

Mormons settling on the shores of the Great Salt Lake, in Utah, were the first of the English-speaking people to make a systematic application of the principles of irrigation in the west. They turned the waters of the Wasatch mountain streams upon their holdings, the present site of Salt Lake City, mastering the art after years of effort. Priests of the early missions also made use of water on the lands in Southern California, where today may be seen the ruins of pretentious works built by the Indians. Placer gold miners in California utilized the water from their ditches for irrigation purposes.

The results obtained in Utah and California induced settlers in other states and territories to try the plan and small tracts of land were put under the ditches in Idaho, Washington and Oregon. The Indians in the Clearwater country, in Idaho, were, it is said, the first in this part of the country to use artificially supplied moisture in the cultivation of crops. The Rev. Henry H. Spalding, who came to the northwest with Dr. Marcus Whitman, mentioned this fact in his early letters to relatives in New England.

Less than 20,000 acres were under irrigation in the United States in 1870 but during the next decade the acreage was increased to 1,000,000. The federal census shows 3,631,481 acres on 54,136 farms under the ditch in 1889, the area doubling the following decade, due largely to the extension of the existing canals. A special census in 1902 showed 120,008 farms with a total of 9,034,526 acres under irrigation. Congress adopted the national irrigation act that year, which saw the beginning of the construction of work under the control of the secretary of the interior, the fund being derived from the disposal of reclaimed lands. The law provides that the cost of the work is to be apportioned to the land and refunded to the government in ten yearly installments without interest.

Twenty-five projects completed and upon which the government is now at work will, when fully developed, add 3,198,000 acres of land to the crop-producing area of the United States, while thirteen others held in abeyance until the completion of the former, will reclaim 3,270,000 acres, making a total of 6,468,000 acres reclaimed at a cost of $159,621,000.

The largest of the projects in Washington are in the Yakima valley, as follows: Sunnyside, 90,000 acres, cost. $1,600,0000; Tieton, 30,000 acres, cost $1,500,000; Wapato, 120,000, cost $1,500,000. The Okanogan will water 8000 acres at a cost of $500,000. Other projects contemplated will add 400,000 acres to the state's crop-producing area.

Government projects in Idaho are the Minedoka, 160,000 acres, costing $4,000,000, and the Payette-Boise, 200,000 acres, completed at a cost of $3,000,000. The latter covers the largest single tract under irrigation on the continent at the present time. Oregon has the Umatilla, 18,000 acres, costing $1,100,000, and the Klamath, extending into California, 120,000 acres, costing $3,600,000.

The projects in Montana are the Huntley, 33,000 acres, costing $900,000; the Sun river, 16,000 acres, costing $500,000, and the Milk river, including the St. Mary, 30,000 acres, in Montana and North Dakota, will cost $2,700,000. The Blackfeet will water 37,000 acres in Montana, where will also be built the Flathead, 130,000 acres, and Fort Peck, 75,000 acres.

Salt River project in Arizona will water 200,000 acres, while the Yuma in California and Arizona will care for 100,000. Other projects are the Uncompahgre, Colorado, 150,000 acres; Garden City, Kansas, 8000; North Platte, Wyoming and Nebraska, 110,000; Truckee-Carson, Nevada, 200,000; Hondo, Carlsbad and Rio Grande, New Mexico, 45,000; Buford, Trenton, North Dakota, 40,000; Belle Fourche, South Dakota, 100,000; Shoshone, Wyoming, 100,000, and Strawberry Valley, Utah, 35,000.

Several millions of acres of lands will also be covered in Montana, California, Washington, Colorado, Arizona, Idaho, Texas, Nevada, New Mexico, Oklahoma, Wyoming and Oregon, as soon as the funds are available.

More than 10,000,000 acres of lands are under private plants in various states where plans are now under way to put 5,000,000 acres under the ditch during the next three years. If these projects are carried out the Horse Heaven country in Washington, will contain a single tract of 600,000 acres, watered at a cost of $15,000,000. The Canadian Pacific project in the Bow River valley, east of Calgary, Alberta, upon which work started in 1904, will cover 3,000,000 acres at a cost of $5,000,000, making it the largest single tract on the continent.—Ex.

Logan and mammoth blackberries in Sonoma county have been affected with fungus which acts upon leaves somewhat as shot hole fungus does. It has affected the quality and quantity of the fruit. Prof. Ralph E. Smith recommends the use of Bordeaux as a preventive of the trouble.

Money Making Little Liners

In this department we will insert your advertisement under a classified head for 1½ cents per word. No ad accepted for less than 25c. Our classified columns are the clearing house for our many thousand readers.

MACHINERY.

FOR SALE—SECOND HAND
WINDMILLS, TANKS,
PUMPS, ENGINES,
FARM MACHINERY,
that will do the same work as new at half the price. Domestic and irrigating windmills and tanks; all sizes. Tanks from 50 gallons up to 50,000. Engines—three 2 H. P. Fairbanks; 3 H. P. Dempster, 6 H. P. Fairbanks, 6 H. P. White & Middleton. 9 H. P. Moore, 10 H. P. Lambert, 18 H. P. Western, 25 H. P. self-contained engine and mining hoist, brand new 2 and 4 H. P. steam engine and boilers. Farm wagons, threshing machine, baler, header, Fosmer gang plow and Venicia disc gang breaking plow, road plow, sacker, hay truck, wagon tanks, slip and Fresno scrapers, wood sawing outfit mounted, splitter, weeder, fruit crusher, bone grinder. Most anything a rancher wants, second hand. DEMMITT CO., upstairs 120 N. Main, Los Angeles.

FOR SALE—15 H. P. OTTO GASOLINE engine, like new. BAILIE & BRANDT COMPANY, 943-945 No. Main St., Los Angeles, Cal.

FOR SALE—50 H. P. FAIRBANKS-Morse Distillate Engine. Owner will guarantee for one year. MACHINERY EXCHANGE, Main and Bruno Sts., Los Angeles, Cal.

FOR SALE—6 INCH CENTRIFUGAL pump, also double acting deep well pump and cylinder. MACHINERY EXCHANGE, Main and Bruno Sts., Los Angeles, Cal.

FOR SALE OR EXCHANGE—ELECTRIC motors for gas engines. BAILIE & BRANDT COMPANY, 943-945 No. Main St., Los Angeles, Cal.

TREES.

100,000 EUCALYPTUS ROSTRATA AND Tereticornis, 1400 Valencia Orange trees, 5000 Washingtonia Robusta, Chamaerops Excelsa, and Date Palms. Also fruit trees, roses and other stock for sale at a bargain. We can save you money. Write us for prices. ARMSTRONG'S COVINA NURSERIES, Covina, Cal.

FINE LARGE EUREKA LEMON AND Valencia Orange trees, fine for replanting. Choice lot of fine Wash. Navels. Order quickly. They are going. Home 'phone 1731. JOHN R. KING, Whittier. Cal.

MARSH SEEDLESS GRAPEFRUIT—600 large trees for sale. E. S. THACHER, Nordhoff. Cal.

MR. NURSERYMAN—WHAT DO YOU need? What is your overstock? BALLOU'S NURSERY, Pasadena. Cal.

LATE VALENCIA ORANGE TREES for sale for May and June delivery. ADOLFH RIMPAU, Anaheim. Cal.

FOR FIRST CLASS VALENCIA AND Navel orange trees and Eureka lemons see A. G. SNOW, Oxnard, Cal.

WANTED.

WANTED—YOUR WORK PAYS THE expense to learn a trade that pays $5 a day, in a few months' time; electricity, automobiles, plumbing, bricklaying; actual contract jobs; 200 students last year. UNITED TRADE SCHOOL CONTRACTING COMPANY, 647 Pacific Electric Bldg., Los Angeles, Cal.

A FARMER, UP-TO-DATE AND A hustler, wants a place as foreman or superintendent. Is thorough in general farming, irrigation, vine and deciduous fruit growing. Experienced in working all kinds of labor, both tenant and wage system. Address BOX 647, Monrovia. Cal.

WANTED—HAVE DEMAND AND OPportunity for sale and exchange of suburban, beach ,and farm properties. PARRISH BARKER, 207 Union Trust Bldg., Los Angeles. Phone A 3272.

WANTED — COMPETENT RANCH hand. Wages $35.00 and board. C. R. STAPLES, Pixley Hardware Co., Orange, Cal.

HORTICULTURAL PRINTING.

THE KRUCKENBERG PRESS, 123 South Los Angeles St., Los Angeles, Cal., makes a specialty of Horticultural Printing and Engraving. Cuts and illustrations of all standard, economic and ornamental plants on hand and subject to the use of patrons without cost. Samples and estimates cheerfully furnished. Remember, we design, write, engrave, bind and print; in brief, do the "whole thing," at no additional expense to the customer. Correspondence a pleasure; a personal visit a joy. Headquarters for catalogues and quadri-color printing.

LIVE STOCK.

BERKSHIRE HOGS — POPULAR strains. Pigs. Young brood sows bred to Kingsclere Duke 3rd 111812. G. B. REEVES, Mountain View, Cal.

REGISTERED SHORTHORN BULLS and Poland China Hogs for sale. Best breeding. P. H. MURPHY, Perkins, Cal.

FOR SALE—DUROC JERSEY PIGS, six weeks old, $5.00 each. Address W. J. COLE, Anaheim, Cal.

Is the title of a booklet (briefly put) that I have written and just published. If, in the past, your hens have not laid well during the winter time, when prices of eggs were high, and you can welcome bona-fide, practical information and instructions that will tell you honestly just how to feed and care for your hens at less expense, that will positively induce them to lay eggs during the winter months, send One Dollar P. O. Money Order to me and I will mail to you, postpaid, one copy of the above mentioned booklet. L. D. HADLEY, 123 South Los Angeles St., Los Angeles, Cal.

HOW TO MAKE MONEY—MRS. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1.00. Address Mrs. A. Basley, Box 77, Venice, Cal. Send postal.

CHICKS! CHICKS! CHICKS! CHICKS!
2500 Per Week.
Barred Rocks, Rhode Island Reds, White Rocks, Brown and White Leghorns. We ship safely everywhere within 48 hours. Send today for free 32-page book. Tells all about the chicks we offer and gives prices on laying hens. pullets, cocks, etc. PIONEER HATCHERY CO., 112 East 8th St., Los Angeles.

SEND US ADDRESSES OF 5 PERsons who have fowls and we will send you, postpaid, our Biddy Booklet and an Anchor Egg Separator. And if you will send us 20 addresses we will also send, postpaid, the Poultry Manual, a book well worth 50 cents. WEST COAST MILL, office 115 Winston St., Los Angeles, Cal.

150 RHODE ISLAND RED HENS, yearlings and two-year-olds, have been left with me to sell. 50 at $1.00 each, 50 at $1.25, 50 at $1.50. To the purchaser of the entire lot a discount of 10 per cent will be made. CHAS. E. WINSLOW, Monrovia, Cal. Box 368, phone 181.

POULTRY WANTED—WE PAY THE highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. ALLAWAY & LAYTON CO., 607 E. 3rd St., Los Angeles, Cal.

BUFF ORPINGTONS AND BUFF MINorcas, males. Buckeye (Reds). both male and female. Cheap if taken at once. Must have room. Wanted, a few S. C. Buff Minorca pullets. MRS. A. V. COX, San Luis Obispo, Cal. Lock Box 302.

FOR SALE—PURE BRED BARRED Plymouth Rock chickens. Crane and McClanahan strains. March hatch. $10.00 a dozen, $1.00 each. Mated pens. MINNEWAWA VINEYARD, Fresno, Cal.

LOVELL'S BLACK MINORCAS
California's
greatest egg producers
Pedigreed, trapnested, scientifically bred. Free circular. DAVID J. LOVELL, 5720 So. Park Ave., Los Angeles. Cal.

BONNELL'S S. C. BLACK MINORCAS win every time, the best that can be secured at any price. Eggs reduced to $1.50 per setting. A few cockerels for sale. C. C. BONNELL, State Vice President American Black Minorca Club, 2919 Brighton Ave., Los Angeles.

FOR SALE—EGGS FOR HATCHING from thoroughbred Mammoth Pekin and Indian Runner ducks, 75c per 12, $5.00 per 100. A. E. NELSON, El Monte, Cal.

THEY LAY AND WIN. ROSE COMB Black Minorcas. ELEANORE MINORCA FARM, Route 1, Los Angeles, Cal. Stock for sale.

BLACK MINORCAS OF QUALITY—Eggs $5.00 per 100. Ask for club catalog. S. D. BICKFORD, Gardena, Cal.

POULTRY.

FOR SALE—EIGHT HENS AND COCK, Rose Comb Black Minorcas (Northrup strain). Seven hens and cock, White Minorcas. All pure bred, fine stock. Also pullets and cockerels, and Rhode Island Reds. C. U. CHAMBERLIN, Gem City Yards, Los Gatos, Cal.,

LODI HATCHERY—JUST HATCHED, chicks from healthy, heavy laying stock. Booking orders for later delivery. T. C. HAWLEY, 504 E. Elm St., Lodi, Cal.

FARM LANDS FOR SALE.

FOR SALE—815 ACRES IN SAN LUIS Obispo County. A typical dairy ranch. Plenty of wood, water, irrigable land, buildings, fenced and cross fenced. Orchards, vineyards, oranges, lemons and walnuts do exceedingly well here. 40 acres of land suitable for these. Price $21 per acre. For further particulars apply to MRS. F. A. CLINK, Pozo, Cal.

2285 ACRES CHOICE, DEEP, SANDY loam. Ideal for subdivision or Eucalyptus growing. Can be cultivated any day in the year. Southern Pacific Railroad runs through the ranch. Also close to deep water for shipping. Free from wind and frost. Now all planted to grain. Price $100,000.00 for limited time. GEO. W. SILL & CO., Watsonville, Cal.

FOR SALE—5½ ACRES OF LAND one mile west of Santa Maria, on electric car line, good level bean land, 300 yards from a public school, no dust, a nice place for residence; vegetables, berries and all kinds of fruit. Address G. L. STEPHENS, Arroyo Grande, San Luis Obispo Co., or MARY E. MORE, Santa Maria. Cal.

FOR SALE—RANCHES AND COUNTRY homes specialized. Exchange and market for this class of property. Accurate and reliable information always. Full particulars. Large lists. Choice properties. Safe prices. Correspondence invited. PARRISH BARKER, 207 Union Trust Bldg., Los Angeles, Cal.

BARGAIN IN FRUIT OR DAIRY ranch. I have for sale 160 acres of No. 1 fruit land in peach and raisin belt of Fresno county. On line of proposed Fresno and Monterey Electric Railroad. Level as floor and all irrigable. Water rates 33 1-3 cents per acre per season. Price $2200. Half down, balance time. CARL R. FLORY, Lemoore, Cal.

IRRIGATED LAND FOR SALE, cheap. In the Lower Rio Grande Valley of South Texas. Ideal climate. Good markets. Large crops. Special inducements to several practical irrigation farmers. Address MANAGER, care of Cultivator, at once, or AMERICAN RIO GRANDE LAND & IRRIGATION CO., Mercedes, Hidalgo County, Texas.

ORANGE GROVES—ALL SORTS, AGES, conditions and prices. Groves in best districts. Six year's experience. References all banks in Claremont and Pomona. A. W. RICHARDS, Claremont, Cal.

APPLE ORCHARDS, LARGE AND small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. GEO. W. SILL & CO., Watsonville Cal

FRUITS, FLOWERS, SUNSHINE, progress—all these invite investigating beautiful Hemet Valley, Southern California. Booklet free. WILLIAM KINGHAM, Hemet, Riverside County, Cal.

FOR SALE—EL CAJON GRANT LAND. In the heart of El Cajon Valley, 30 acres of choice vineyard, large house, cottage and barn; trays, boxes, etc. Close to proposed electric line. S. B. HAWLEY. 1548 D. St., San Diego. Cal.

FOR SALE—PERRIS VALLEY, 640 acres choice alfalfa land, close to railroad, water guaranteed, $50, big snap. STACY REALTY CO., 531 So. Spring St., Los Angeles, Cal., F 2115; or Stacy-Wagner Co., Riverside.

MISCELLANEOUS.

HAVING OPENED A DAIRY SUPPLY house, would be glad to see all my friends and former customers. When in need of dairy supplies, milk coolers, cream separators, milk cans, milk bottles, etc., write or call GUY F. KELSEY, 108 East 8th St., Los Angeles.

FOR SALE—1160 FEET SURFACE IRrigating pipe, 8 in., good as new, $150, f. o. b. Richfield or Anaheim. Address J. L. DAVEE, Olive, Orange Co., Cal.

RARE PLANTS.

WILD PLANT IMPROVEMENT GARdens, Santa Ana, California. NEWTON B. PIERCE, Proprietor. Rare choice ornamentals and new fruits from all lands.

SOIL EXPERT.

SCIENTIFIC EXAMINATIONS MADE of soils and irrigation waters. Reliable information furnished regarding suitability of soils for citrus and other fruits. Thirteen years experience with U. S. Department of Agriculture as soil and alkali expert. CLARENCE W. DORSEY, Whittier, Cal.

Legal

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Attaching Income.

Can one secure by law housekeeper's wages where a man has no real estate, but is working on a salary which is more than enough to support his family?—Subscriber.

If the only income the man has is his salary, his earnings for the thirty days previous to the time of attachment are exempt, unless the claim is for necessaries of life furnished him or his family, so, the housekeeper might possibly collect by attachment, or she might obtain a judgment against her employer, which would be good for five years, and hold it in hopes that the debtor might obtain some property during that time, upon which she might levy.—E. L. P.

Water Appurtenant To Lands.

Can a water right be separated from land secured from the government under the Desert Act? Where land has been so secured and water developed can this land be re-sold and water right reserved, or does the water right go with the land indefinitely?—Subscriber, Wasco.

The inquirer does not specify what kind of a water right he has reference to. If it is a right held under a co-operative irrigation company, or other corporation formed under the laws of the State of California for the purpose of furnishing water, it, in all probability, is made appurtenant the land, and a part of the land to which it attaches. If it is a right which the owner of the soil has himself created or developed upon the same or adjacent land, I have no doubt that it could be sold independently of the land. The Desert Act makes no reference to the disposal of water rights, but is confined to the method of acquiring the land itself.—E. L. P.

Collecting Damages.

Can I secure compensation for carelessly knocking down seven-month filly by team driven in center of road? Driver did not slacken as he approached colt, the pole struck it, and horses were allowed to gallop while both wheels passed over its body. Colt died at once. This was November 29th last. Is it too late to start suit for damages?—Subscriber.

No, it is not too late to commence suit for the death of your colt, and if the driver of the team was careless. as you say, you should recover damages.—E. L. P.

Use of Common Ditch.

"A" owns 35 acres and sells five at lower end to "B" with water right through his land by ditch or pipe. Later "A" sells ten acres adjoining "B" to "C" and "C" then sells five acres to "D." All use water from the same ditch, making their own d[illegible] where they like. The gates they use do not fit well and leak. They also leave cuts open. Should "A" have to fill in cuts or bank up gates after owners of lower land are through irrigating?—Subscriber, Inglewood.

The party last using the ditch should use it in a reasonable way, and leave it in such a condition that a party having the right of subsequent use would not be put to any unreasonable amount of labor in order to enjoy the said ditch.—E. L. P.

RABBITS.

FOR SALE—EUREKA RABBIT WARren Co., 928 Valverde St., Los Angeles, Cal., Wright and King, props. 150 fine bred New Zealand hares and 200 fine bred Belgian brood does and stud bucks from $1.00 up. Your correspondence is solicited.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Scutellista for Scale.

Replying to the question, as to proper time, to introduce scutellista. I would suggest that for the destruction of the present brood of black scale, it is already too late in the season to colonize this fine parasite, but for future benefits, the present time is most favorable. Scutellista can feed only upon the egg form of black scale, and this feeding is done only by the second or larval form of the parasite, so that the introduced fly which is to deposit beneath the black scale insects, her eggs from which these feeding larvae emerge, should be in the field just before or soon after the scale begins its egg deposit, which occurs for the most part in May and June. Most of these scales are now in full egg form, and upon rebudded and young, thrifty trees are in process of hatching, and will thus escape the newly introduced parasites, but there are always a smaller proportion of out-of-season scale, and through successive breeding in these belated scale, a small number of the parasites are carried over the fall and winter. Scutellista will not remain where planted unless black scale in egg forming condition are present but may seek other near-by pastures and thus be of value.—C. E. Bemis.

Rental for Dry Yard.

Kindly answer through Cultivator what would be fair rental of dry yards of half acre including use of racks and sulphur house, but no trays or boxes, for crop of apricots; also for the same dry yard with use of track, car and dipper for prune crop? What are eight-foot trays and 40-pound picking boxes worth for single crop?—C. L. K., Mountain View.

This query was referred to Mr. G. H. Waters of Pomona who has had wide experience in such matters, and he answers:

"A fair rental for half acre, including sulphur houses, for the apricot season, which is one month, would be fifteen dollars. I have rented ground to people and have also rented ground from people for this pur, pose, and that is the amount I have paid, and I would think that for the prune season the same amount would be a fair rental where there are no trays used. For the use of trays for sixty days I have always paid 2 cents apiece, and the same for picking boxes. For prunes they charge more for the use of boxes and trays, as they have to be washed before they can be used for anything else after the prunes have been on them.

Spiders on Curling Leaves.

I send leaves from small plum trees. This is second summer's growth. The leaves are curling badly, especially those near trunk of tree. They work towards the rib, some being curled together almost like a scroll. Many are occupied by small spiders and many leaves are filled with spider webs. Are they the cause of the trouble?—X., Los Angeles.

The spiders are in no way responsible for the general curling of the leaves. Spiders usually do, of course, select furled leaves in which to make their nests, but usually the curling is due to some other cause. It looks as though there was some trouble with the root system. Is it possible that the tree has been gophered? Or, there may be a superabundance of water. Without looking into the thing closely, of course, I am unable to say definitely what conditions may be present.—H. J. Quayle, Entomologist.

Canning Fruit.

Advise safest and best way to put up fruit such as peaches, Bartlett pears, plums, etc. Will they keep all right in screw-top bottles? I do not like cans. How can I put up tomatoes to keep them whole? Some say it is not necessary to put sugar with them. Can they be kept without sugar?—S. B., Modesto.

We will ask the housewives to give us information regarding points of canning. In a general way we may say that screw-top bottles will answer in place of cans providing that rubber packing is used so that air is absolutely excluded, as is the case with the regular fruit jars. Unless the tops of the bottles are more regular than is usually the case, there might be trouble in securing this air-tight condition.

As to the use of sugar with tomatoes, would say that they are usually canned without sugar. In fact, many housewives prefer to put up many kinds of fruit without sugar. It must be borne in mind that the principle of canning fruit is to thoroughly sterilize by boiling so as to destroy fungous spores or any bacteria present. If the cans are then sterilized, and are perfectly air-tight the fruit will keep as well if put up without sugar.

Pruning Young Peach Trees.

I have peach trees in second summer's growth which are sending out a large number of branches. Will it be advisable to cut some of these branches out of center of tree so as to give those in right location a better chance to grow? Will it hurt the trees to prune now?—B. E. H., Kingsburg.

Young growing trees should not be pruned to any extent during the growing period as it tends to check growth and forces the wood to throw out fruit buds, which is not desirable in such young trees. "Summer pruning for fruit, winter pruning for wood" is one of the oldest and truest of pruning adages. Of course if cross limbs are interfering with growth of good desirable limbs, they should be broken over or removed if necessary. "Thumb pruning" of the tips of undesirable limbs is a very satisfactory way of controlling growth of the tree and does not injure it. Bear in mind that the leaves are the lungs of the tree and should not be removed from young trees unless necessary.

Lippia.

I send specimen of plant which I believe is a bad weed. It started among my grape vines and I have been fighting it but it is very tenacious and increases by running along the ground and taking root.—A. J. H., Phoenix.

Specimen had the appearance of lippia repens except that the leaf was slightly different. When submitted to a botanist he stated that the plant was Lippia cuneifolia, a close relative to the lippia cultivated for lawns. It is a native of the plains from Nebraska to Mexico and Arizona. As it roots freely at the nodes it propagates itself very rapidly. It is not likely to prove troublesome.

Aphis—Spider.

I have pansies which are covered with what looks like red spider and they suck the life from the plants until they die. They first appeared on nasturtiums. These I pulled up and burned. Have tried on the pansy plants soap suds, wood ashes and sulphur, but these did not affect them. There are also green lice on the plants. They are not affecting other flowers.—J. W. S., Charter Oak.

If this is the true red spider or mite, a mixture of one-fourth lime, three-fourths best grade flowers of sulphur, should finish it, but it must be borne in mind that once red spider is apparent on plants, it is almost impossible to save those particular plants. The damage has been done, and it is probable that the generation of the spider that has done it has entirely disappeared. The time to kill the spider is before its work is apparent, by use of sulphur. The aphis may be reached by weak solution of tobacco extract; or strong soap suds even will surely fix them.

Drying Pears.

I have crop of Bartlett pears which are all very scabby. What use can I make of them to best advantage? Can they be dried?—H. B., Santa Cruz.

See our answer to query regarding scabby pears in last issue of Cultivator. That does not touch upon the drying, but will aid in saving next season's crop. This spraying is so simple that fine pears should be grown in so far as scab is concerned. If there are still fair pears on the trees, they may possibly be saved by spraying according to the directions given for Bordeaux spraying.

As to drying the pears. They command a good price and the market usually takes them readily. The most serious objection to the drying is that if there is an apiary near, the bees will take away almost the entire spread before they can dry. The pears are very sweet and seem to be most acceptable to the honey bee. We have seen drying unpeeled pears so completely cleaned up by a few hives of bees that only the skins remained on the trays. Pears are dried in practically the same way as other fruit, that is, halved, cores scooped out, sulphured and dried. A finer product is secured by peeling, but this adds so much to the expense that few attempt it.

Noxious Weeds.

Has California a law which requires land owners to keep their property free of noxious weeds? If so, what are noxious weeds? Is it the duty of county supervisors to keep the public highways free from weeds, brush, etc., or is it the duty of abutting property owners?—W. H. B., Tulare.

The horticultural law passed by the last legislature prescribes the duties of horticultural commissioners and gives power to the horticultural commissions to serve notice upon owners of land which harbors "Russian thistle, saltwort, Johnson grass or other noxious weeds." If the notice does not cause the owner to eradicate the noxious weeds, "it shall be the duty of the county horticultural commissioner to cause said nuisance to be at once abated by eradicating or destroying such diseases, insects or other pests, Russian thistle, saltwort, Johnson grass or other noxious weeds." The law then specifies manner of collection from the land for this eradication. The three pests, Russian thistle, saltwort and Johnson grass are specified, but as to what determines a "noxious weed" the law does not state. We think that would be easily proven in any court, however. Any persistent, pernicious weed which is injurious to crops and spreads from place to place would come under that law.

As to the power of the commission over public highways, we are at loss and have referred the question to the state horticultural commission. We do not doubt that the county supervisors have power over weeds on the highways, but whether the cost of eradication would fall upon abutting property owner or the county, we will ask the state commission to decide.

Dodder on Seed Bed Stock.

Can you recommend something which will kill love vine on seed bed orange trees? My seed bed is infested and it will take the entire bed if I do not take immediate steps to stop it. The bed looks as if a fire had passed over it.—Subscriber, Fullerton.

If the infestation is over only a small portion of the seed bed, we would destroy at once by burning trees and dodder together. That seems to be the only satisfactory way of completely eradicating the pest. However, if it is scattered or more or less infesting entire bed we would make an effort to control by spraying with sulphate of iron mixture. Sulphate of iron ten pounds, water 40 gallons, is sufficiently strong to kill the love vine. As to whether it will injure orange plants, we cannot tell you, and would advise careful experimenting.

Veterinary

Answers in this column by Dr. R. T. Whittlesey, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

For Burns.

I have a horse that was burned on the neck and back when my barn was burned. What shall I do for the burn to bring the hair back, or will it come in again?—O. W., Fillmore.

There is nothing that can be [illegible] on a burn to make the hair grow if the roots have been killed. If burn is raw use a solution of sulphate of copper or a powder of dry zinc oxide, but if healed over, keep the skin [illegible] with vaseline.—R. T. W.

DR. WHITTLESEY'S VETERINARY REMEDIES.

These are not ordinary mixtures but are from well tried formulas, used in an extensive practice in Southern California for nearly a quarter of a century. Dr. Whittlesey's Sulphur Arsenical Salve for deep fistulous or ordinary chronic, indolent sores such as. "Poll Evil," "Fistulas," "Quitters," "Thrush," "Scratches," "Warts," "Collar Sores" or "Sit-fasts," $1.00 per package postpaid. Printed directions. Dr. Whittlesey's Antiseptic Healing Powder forms a coating over raw surfaces, excludes air, flies and floating germs. Makes a cheap and convenient dressing for the many sores that occur to stock on the ranch. $1 full pound can postpaid.

DR. R. T. WHITTLESEY,
Veterinary Hospital, 714 East Seventh St., Los Angeles, Cal.

Your Greatest Help in Reducing the Cost of Living

Is Our SPECIAL GROCERY CATALOG

THIS BOOK FREE

52 pages of vital importance on how to save money by buying from the Largest Mail Order House in the West. The Secret of Better Buying is a matter of vital value to every household; to know where every dollar goes to bring the best results is a protection to the home. Our Grocery Catalog is the messenger of wholesale prices, heralding what goods are actually worth. It delivers you from high prices.

OUR PRICES are one-fourth to one half less than your local dealer's. If his price is $10 for an article, you can buy the same thing of us through our catalog for $7.50 and less. This applies to all classes of goods. Because of this enormous saving, most of our customers buy all their supplies of us. They consult our catalog every time for any goods they use. It is a reference book on low prices. They save at least 25c on every dollar's worth of goods they buy from us. It's worth while to save 25c on every dollar's worth of goods you buy. The 25c saved is just like you had worked hard to earn it.

IT WILL PAY you big to buy all or as much of your goods as possible through our catalog. Besides the great saving you can make through trading by mail with us, it's the easiest and most satisfactory way of buying goods. there is no hurry or confusion, no worry that you are taking up a salesman's time if you are a bit slow in making a selection, and in the seclusion of you home, surrounded by your family you can select the goods you need from our big catalog with best judgment and greatest economy. The United States mails will speedily bring us your orders and flying express, mail or freight trains will carry the goods to you with the greatest dispatch and perfect safety.

OUR GUARANTEE is to safeguard your interest to every extent that we will give the service you have a right to expect, we stand back of every statement we make and your money, together with transportation charges and any further expense you may have incurred, will be promptly returned to you if you are not satisfied. Every article in this catalog is, therefore, offered with the understanding and agreement that it must satisfy you perfectly, and if there is the slightest dissatisfaction because of quality, style, size, color or any other reason, we expect you to return the purchase to us at our expense. Does the retailer make you this offer? Ask him! **REMEMBER THAT THE RISK IS ALL OURS.**

THE LEGEND OF THE RAINBOW.

By. B. F. Allen, Dedicated to the Pajaro Valley, California.

The land of the Pajaros,
Of warbles and trills,
Of beautiful flowers
O'er valley and hills,
Fragrant with pearl drops
Of dew in the morn,
For fairy's retreat
This valley was born.
In the time of the far
Distant years of the past,
Before rainbows were known
By reflection to cast,
'Twas the fairies who wrought,
For their loved queen's delight,
A garland of beauty,
Most gorgeous and bright,
And the plumage of birds,
With their carpets bright sheen
Of sweet scented blossoms,
Was declared by their queen,
The most perfect emblem
Of all at command,
Their God's gracious gift
To their own fairyland.
So they worked with a will
This garland to twine,
Of plumage and blossoms
And sweet columbine,
And their fair queen declared,
When the emblem was done,
"'Tis a token for only
The queen of the sun,
Our messengers to convey
This token of love,
Shall be our sweet songsters
Led by a snow white dove."
So they bore it away
Through the gloom of the night,
To the eastward where first
Darkness gives way to light.
And at morn when the sun
Casts its bright rays anew;
Its queen first beheld
This treasure jeweled with dew.
"Oh, where," she exclaimed,
"Neath heaven's blue dome,
Where, bright winged soarers,
Oh, where is thy home?
This treasure you bring
Whence had such beauty its birth,
Where of heaven's bequeath
Sweet angels of earth?
Is there a spot more favored
For heaven to place,
On earth's verdant bosom
Its treasure to grace?
Soar back to thy home,
To this land of sweet rest
With this message I send
To thy queen in the West
And tell her this garland
For all time yet to come,
Reflected shall be
From the rays of the sun,
And henceforth on earth
Shall appear the rainbow,
Its birth in this jewel
From her beloved Pajaro.

—Copyright, 1910 By B. F. Allen, used by permission.

THE NOTORIOUS JUMPING FROG OF CALAVARAS COUNTY.

(Concluded from last Week.)

"Well, this-yer Smiley had rat-tarriers, and chicken cocks, and tom-cats and all them kind of things, till you couldn't rest, and you couldn't fetch nothing for him to bet on but he'd match you. He ketched a frog one day, and took him home, and said he cal'lated to educate him; and so he never done nothing for three months but set in his back yard and learn that frog to jump. And you bet you he did learn him, too. He'd give him a little punch behind, and the next minute you'd see that frog whirling in the air like a doughnut—see him turn one summerset, or maybe a couple, if he got a good start, and come down flat-footed and all right, like a cat. He got him up so in the matter of ketching flies, and kep' him in practice so constant, that he'd nail a fly every time as fur as he could see him. Smiley said all a frog wanted was education and he could do 'most anything—and I believe him. Why I've seen him set Dan'l Webster down here on this floor—Dan'l Webster was the name of the frog—and sing out 'Flies, Dan'l, flies!' and quicker'n you could wink he'd spring straight up and snake a fly off'n the counter there, and flop down on the floor ag'in as solid as a gob of mud, and fall to scratching his head with his hind foot as indifferent as if he hadn't no idea he'd been doin' any more'n any frog might do. You never see a frog so modest and straight for'ard as he was, for all he was so gifted. And when it come to fair and square jumping on a dead level, he could get over more ground at one straddle than any animal of his breed you ever see. Jumping on a deal level was his strong suit you understand; and when it come to that Smiley would ante up money on him as long as he had a red. Smiley was monstrous proud of his frog, and well he might be, for fellers that had traveled and been everywhere, all said he laid it over any frog that ever they see.

"Well, Smiley kep' the beast in a little lattice box, and he used to fetch him down-town sometimes and lay for a bet. One day a feller—a stranger in the camp, he was—come acrost him with his box, and says:

"'What might it be that you've got in the box?'

"And Smiley says, sorter indifferent-like, 'It might be a parrot, or it might be a canary, maybe, but it ain't—it's just only a frog.'

"And the feller took it, and looked at it careful, and turned it round this way and that,, and says, 'H'm—so 'tis. Well, what's he good for-'

"'Well,' Smiley says, easy and careless, 'he's good enough for one thing, I should judge—he can outjump any frog in Calaveras County.'

"The feller took the box again, and took another long, particular look, and give it back to Smiley, and says, very deliberate, 'Well,' he says, 'I don't see no p'ints about that frog that's any better'n any other frog.'

" Maybe you don't, Smiley says. 'Maybe you understand frogs, and maybe you don't understand 'em; maybe you've had experience, and maybe you ain't only a amateur, as it were. Anyways, I've got my opinion, and I'll resk forty dollars that he can outjump any frog in Calaveras County.'

"And the feller studied a minute, and then says, kinder sad like, 'Well, I'm only a stranger here, and I ain't got no frog; but if I had a frog, I'd bet you.'

"And then Smiley says, 'That's all right—that's all right—if you'll hold my box a minute, I'll go and get you a frog.' And so the feller took the box, and put up his forty dollars along with Smiley's, and set down to wait.

"So he set there a good while, thinking and thinking to hisself, and then he got the frog out and prized his mouth open, and took a teaspoon and filled him full of quail shot—filled him pretty near up to his chin—and set him on the floor. Smiley he went to the swamp and slopped around in the mud for a long time, and finally he ketched a frog, and fetched him in, and give him to this feller, and says:

"'Now, if you're ready, set him alongside of Dan'l, with his forepaws just even with Dan'l, and I'll give the word.' Then he says, 'One—two—three—git!' and him and the feller touched up the frogs from behind, and the new frog hopped off lively, but Dan'l give a heave, and hysted up his shoulders—so—like a Frenchman, but it warn't no use—he couldn't budge; he was planted as solid as a church, and he couldn't no more stir than if he was anchored out. Smiley was a good deal surprised, and he was disgusted, too, but he didn't have no idea what the matter was, of course.

"The feller took the money and started away; and when he was going out at the door, he sorter jerked his thumb over his shoulder—so—at Dan'l, and says again, very deliberate, 'Well,' he says, 'I don't see no p'ints about that frog that's better'n any other frog.'

"Smiley he stood scratching his head and looking down at Dan'l a long time, and at last he says, 'I do wonder what in the nation that frog throw'd off for—I wonder if there ain't something the matter with him—he 'pears to look mighty baggy, somehow.' And he ketched Dan'l by the nap of the neck, and hefted him, and says, 'Why, blame my cats if he don't weigh five pounds!' and turned him upside down, and he belched out a double handful of shot. And then he see how it was, and he was the maddest man—he set the frog down and took out after the feller, but he never ketched him. And—"

[Here Simon Wheeler heard his name called from the front yard, and got up to see what was wanted.] Turning to me as he moved away, he said: "Just set where you are, stranger, and rest easy—I ain't going to be gone a second."

But, by your leave, I did not think that a continuation of the history of the enterprising vagabond Jim Smiley would be likely to afford me much information concerning the Rev. Leonidas W. Smiley, and so I started away.

At the door I met the sociable Wheeler returning, and he buttonholed me, and re-commenced:

"Well, this-yer Smiley had a yaller, one-eyed cow that didn't have no tail, only jest a short stump like a bannanner, and—"

However, lacking both time and inclination, I did not wait to hear about the afflicted cow, but took my leave."
—Mark Twain.

THE PICKLE SEASON.

We find that a great many of our readers desire some information regarding the home manufacture of pickles and condiments of various kinds, hence we devote this column to such matter. These are all tested recipes but while one might suit some folks another person might prefer a different formula, so take your choice.

Cucumbers for pickling should be small, not more than two or three inches in length. Put them in a tub, cask or barrel with a layer of salt and cucumbers alternately. Turn on boiling water and let them stand for ten or twelve hours. Take out from the salt water and turn on boiling water again and let them stand until the water is cold, then take them out and cover with vinegar. Pickles prepared in this manner will be crisp and brittle and require no alum or other injurious substance to make them so.

Another proved recipe is to pick each morning the small cucumbers as they become of sufficient size. Place them in a rather weak brine for three or four days, adding some mustard pods and horseradish leaves which will green them innocently and without communicating any poisonous qualities. After they have stood for the time named, take them out and drain them and then cover with vinegar for a week, at which time take them out and drain again, putting on fresh vinegar and adding mustard seed. Add ginger root, cloves, pepper and red pepper pods to suit the taste. This is a good recipe for those who prefer not to scald them. The vinegar should be changed once, because of the large amount of water in the cucumber which reduces the strength of the first vinegar placed on them.

Sweet Cucumber Pickles.

Select rather small, ripe cucumbers of uniform size. Steam them for three hours in a closely-covered preserving kettle, lining this and covering the cucumbers with grape vine leaves if they can be procured. To a kettleful of material allow two teaspoonfuls of powdered alum, scattering it over each layer of the cucumbers. Of water there should be only just enough to cover the vegetables. When the period of steaming is at an end drain off the water and throw the cucumbers into very cold water. Change this four times in four hours. Then weigh the cucumbers and allow for every pound of these one pound sugar and one-half cup of cold water. Heat these two together gradually, and when hot lay in the cucumbers. Let them simmer very slowly until tender; take them out and spread upon dishes, while adding to the syrup on the stove a pint of vinegar for every pound of cucumbers, and to every eight pounds of them a tablespoonful each of ground cloves, cinnamon and mace.

Mustard Pickles.

Take one quart of ripe cucumbers, cut in pieces one inch long, one quart of small green cucumbers, one quart of small white onions, one large head of cauliflower. Scald all in weak brine, and then place in weak vinegar water. Bring two quarts of cider vinegar to a boiling point. Take one small bottle of French mustard, six tablespoonfuls of dry mustard and one-half cup of flour. Add a little vinegar to the dry mustard and flour to make it into a paste and then add the French mustard. Dissolve two cups of sugar in the hot vinegar, also two tablespoonfuls of turmeric and one-fourth teaspoonful of red pepper. Add the mixed mustard paste to the hot vinegar carefully and strain if lumpy. Pour this boiling hot over the mixture and seal. If the brine water did not make the mixture salty enough more salt may be added.—Field and Farm.

THE CHURCH'S MILLINERY SECTION.

Because many of the feminine members of the congregation of a Baptist church in a southern city insist on wearing their hats in church, its pastor has set aside a certain portion of the church as the "Millinery Section," for use of these hat wearers.

The minister anounced that all women who come with large creations adorning their heads must either take them off or sit in the "Millinery Section."

The practice of women wearing hats during the services has been a subject of agitation for some time with the men attendants, and the pastor has from time to time openly opposed it. The minister commented rather sharply on the practice of wearing hats in church, and announced the new program for a "millinery section."

This is all right in its way, but to eliminate the hat is to eliminate the wearer. When it comes time for the separation of the sheep from the goats, the dominie will be charged up with the loss of souls and the dismembering of his church.

There is a moral influence in things which amuse and make us enjoy life. No one was ever spoiled by good humor; but tens of thousands have been made better by it. Fun is a food as necessary as bread.

Any one who has brought relief to distressed souls, who has lifted the burden from saddened, sorrowing hearts, has done as much good as any one of those who have been civilization builders.

Laughter is a token of saneness. Abnormal people seldom laugh. It is as natural to want to laugh and have a good time as it is to breathe. There is something wrong about a person who seldom laughs.

HOMELESS CHILDREN

Want fathers and mothers. Cultivator readers have taken hundreds of them, and they tell us of mutual happiness and satisfaction.

No home is complete without a child in the house.

Favorable arrangement can be made.

Hay.

Scott, Magner & Miller report: Arrivals of hay during the week have amounted to 3900 tons. This is a heavy increase over the quantity we have been receiving lately.

Purchasing in the country during the week has been very light; comparatively nothing has been bought for storage purposes, and for immediate shipment but very little has changed hands. The decided opinions of the consumers that the present range of prices are above the basis of what conditions warrant, have caused operators to act slowly so as to avoid losses.

There has been a little movement of export hay and somewhat of inquiry for coastwise shipment; but this trade has helped to relieve us of some little part of our overstock.

There is a little more movement in alfalfa hay. Inquiries for round lots are coming in, but the idea is that prices on this article also must be modified to be able to move large lots satisfactorily.

There are large quantities of straw offering in different parts of the country, but as the trade in this article is decidedly limited, if straw is baled as extensively as anticipated, it may be difficult later on to market same to any advantage.

Deciduous Market

SACRAMENTO, July 9, 1910.

The California Fruit Distributors report:

The following gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, July 8, 1910.

Cherries.

The shipment of this variety of fruit was closed on the 4th instant by shipment of three-fourths of a car, bringing the total shipment for the season up to 250½ cars.

Apricots.

Two and one-fourth cars. This concludes the shipment of this variety of fruit for the season, which has amounted to 290 cars, the largest shipment of apricots recorded in fifteen years.

Peaches.

Fifty and one-half cars. Good varieties of peaches are now going forward, consisting principally of Crawfords. This variety will continue through the greater part of next week and will be followed by Elbertas, late Crawfords and Susquehannas. No large quantities will be available for nearly ten days, but after that time the offerings will be ample to meet all requirements.

Plums.

Two hundred and seven cars. It will be noted there is a small falling off in shipments since our last report. There will be comparatively light supplies for the next week, after which time there probably will be a slight increase. Giant, Diamond, Wickson, California Red, Sugar, Gros, Kelsey, German, Fellenberg, Quackenbos, Imperial and Grand Duke will be the principal varieties going forward.

Pears.

One hundred and forty cars. The heavy movement of Bartlett pears from the Sacramento River is now on.

Next week will see the height of the movement, after which a decline may be expected, followed closely by shipments from Suisun and Vacaville. The fruit is of fine quality this year, of good size and free from defects and is giving universal satisfaction wherever received.

Grapes.

Four or five days of unusually warm weather have undoubtedly reduced the grape crop somewhat, some localities reporting a loss of 25 per cent. This is not, however, in sections that are noted as heavy producers, and while there has undoubtedly been some loss, there will be plenty of fruit left. Fontainbleau is the only variety now being offered, but Black Grapes should put in an appearance within the next ten days.

F. o. b. demand for California fruits has been larger during the past week than at any other time in the season and in fact has been excelled but once or twice in the history of the business. Fruit is not only meeting with good inquiry, but is giving universal satisfaction to purchasers.

Citrus Market

LOS ANGELES, July 13, 1910.

The heavier picking of the last few days has shown that the earlier estimate of the output of Valencias was very much too large. In fact, it is feared now that there will be a material shortage and possibly inability to supply the market's demand. This knowledge has caused a slight advance and an even firmer condition.

Lemons are also firmer, foreigns making an advance of fifty cents in quotations in New York markets yesterday. The auction markets on this page show that they are still clinging to the $6.00 to $8.00 price. A few other markets are even better.

Shipments.

Total shipments of citrus fruits since November 1, 1909: 26,414 cars, of which 22,781 were oranges and 3633 lemons. To same date last season: 32,701 cars, of which 27,947 were oranges and 4754 lemons.

NEW YORK, July 11.—Twenty cars sold. Market continues active but somewhat easier.

HAYWARDS POULTRY SHOW.

The first poultry show of the season was pulled off at Haywards on July 4th. It was one of the features of the Independence Day celebration, and the management are elated over its success. This is an innovation as to season of holding poultry shows, and it succeeded in attracting exhibits from nearly all parts of the state. Mr. E. J. Healey superintended and managed the show; Henry Berrar was judge of the poultry class and H. F. Whitman of Oakland judged the pigeons. There were some valuable and beautiful specials offered and the premium list was liberal. Haywards proposes to be one of the poultry centers of the state.

FUNGUS ON BERRIES.

(Continued from Page 34.)

as to the nature of this trouble, and to learn of any known remedy, the writer sent specimens to Prof. Ralph E. Smith, plant pathologist at the University of California.—C. H. Dwinelle.

"Mr. C. H. Dwinelle, Fulton:—We received your carefully prepared specimens of berry vines. The loganberry from Rev. Donald Cameron is quite badly affected with the leaf spot, as, in fact, were most of the other specimens, which also had the insect trouble. The berry leaf spot is caused by a fungous parasite and also affects the canes. I don't know that treatment would be of any use this year, as the damage has been done, but another year we should advise cutting out the affected parts and spraying with Bordeaux mixture, usual strength, before growth begins in the spring. It might be well to give them a spraying in the fall, just as the first rains come on, renewing the spraying throughout the rainy season as needed. Very little spraying has been tried on berries in this state to our knowledge, and if you carry out the treatment, we should be very glad if you would report as to results.—Ralph E. Smith."

SAVE YOUR HORSES AND YOUR LABOR.

Heider Eveners are as remarkable an invention as the farmer has been blessed with in a long time. No amount of skill or brains could produce a better evener and one is bound to admit that when comparing the Heider with all others. They are made for 2, 3, 4, 5, or 6 horses. Heider 4-horse plow eveners work 4 horses abreast on gang, sulky or disc plows—one horse in furrow, 3 on land. No side draft to Heider eveners, easy to attach. Clevices are also made to attach Heider eveners to any plow. A 3-horse Heider wagon evener is also made as well as neckyokes, wagon doubletrees and singletrees.

Your dealer ought to have them. If you have made up your mind to buy a Heider Evener and he can't supply you, write the factory and they will see that you get one. Be sure to mention the Cultivator. The factory address is Heider Mfg. Co., Dept. 31, Carroll, Iowa.

The Smooth Running Pomona Deep Well Pump

RELIABILITY.

Has passed through another most successful season's run, this being the fifth since starting.

There is no experiment in buying a POMONA PUMP. All the parts have been tried out and fully perfected. They will do the work we know and do it well.

We have records of plants that have made three season's run without one cent for repairs of any kind.

ECONOMY.

May be driven by a steam engine, gas engine or electric motor and in any case will give you the cheapest water and pay dividends on your stock.

Any Water Company going into the Irrigation business will run no chances in buying the POMONA PUMP. They are built heavy and strong. All the wearing parts are Bronze Bushed or Babbited and will last a life time with the smallest outlay for repairs.

We can refer you to customers who are operating their POMONA PUMPS for less than one-half cent per inch per hour on 200 feet lift. This is less than half what their water costs with other pumps. The same make of engine being used in both cases.

Prepare for Frost

California Cultivator

An Illustrated Weekly Magazine, Devoted to the Rural Home and Ranch. One Dollar per Year.

Los Angeles July 21, 1910 San Francisco

Methods Used to Drive Away Jack Frost

The upper picture shows method of covering Italian lemon groves. The trees showing through are walnuts or other than lemons. In the winter, straw mats are laid over the frame work. The branches are tied to the frame and the fruit gathered from underneath similar to a grape arbor.

The middle picture shows the cord wood and fence rail method in Rogue River Valley apple orchards.

At daylight smudge pots are lighted to prevent action of sun's rays on the blossoms.

Orchard Heating

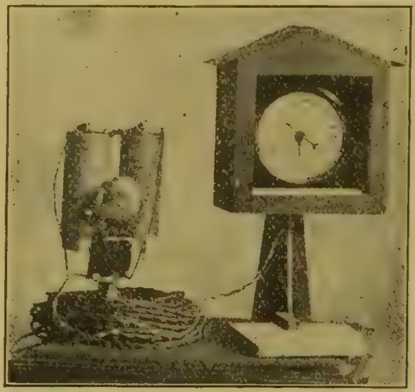
Has Proved the Most Certain Means and is the Only Practical and Perfect Protection Against the Ravages of Frost at Any Time of the Season

Our Heater and Thermometer are patented.

Our Heater
Produces No Soot

We have a device that gathers the soot and the oil we burn has no asphaltum base. The oil we use is as cheap as the crude.

Our Heaters in Action, Saving Apple Orchard



Our Electric Thermometer automatically rings the bell in your bedroom and warns you of the approach of frost.

We Have Sold 200,000 Heaters in Oregon and Washington
and saved all the crops. Our heater is the cheapest and best—this we guarantee.

Protect Orchards from Cold Weather Ravages

The Best Oranges in the World are Grown Where the Temperature May at Times Fall Below Danger Point. The Best Apples in the World are Grown Where Spring Frosts May Catch the Blossoms.

Mr. McAdie wishes farmers to fill out blank, copy of which may be seen on page 55. This is a valuable feature and will lead to some explicit information which Mr. McAdie will give later.

Seventy-five to 100 fires per acre should be provided, then one-fourth or one-half or all lighted as needed.

The Rogue River Valley reports that crops valued at from $500 to $1000 per acre have been saved at a total expense for the season of from $15 to $20.

Use the Weather Bureau more.

Colorado declares it saved $4,000,000 by firing this spring.

Ripe oranges require lower temperature to injure than green ones.

FRUIT growers who have had occasion to fight Jack Frost have sometimes complained that there was no definite or exact information at hand to aid in this field. Some who have newly entered into the fruit business have often expressed the feeling that there have been no investigations of frost protection. By referring back to magazines of eight or ten years ago, we find there was great interest in this subject at that time.

Earlier Investigations.

In a Cultivator issued in the fall of 1902 we find an apology for so many articles appearing in the Cultivator on frost protection for "several years back." One article in the Cultivator of 1901 gives information as to investigations of the Frost Committee of the Riverside Horticultural Club. This committee began its actual field work in Riverside on December 5th, 1897 under the generalship of J. H. Reed. We are told that at that time "accurate thermometers had been provided as well as other instruments. One grower had placed ten acres under firing with oil pots. An adjoining ten acres was supplied with straw flakes moistened. Another had smudge on ten acres. Still another had five acres furnished with fifteen coal baskets to the acre, and last, but not least, another had ten acres supplied with fifteen coal baskets per acre. Another had a five acre tract furnished with large evaporating pans."

In the same issue of the Cultivator is a report of a committee of orange growers of Ontario. This committee tested coal baskets and oil pots in the lemon grove of Mr. Little. The oil pots were supplied with crude oil with sacking used as a sort of wick. This committee reported favorably on both systems, but gave preference to the coal baskets, and gave information as to methods of work.

A House over the Grove.

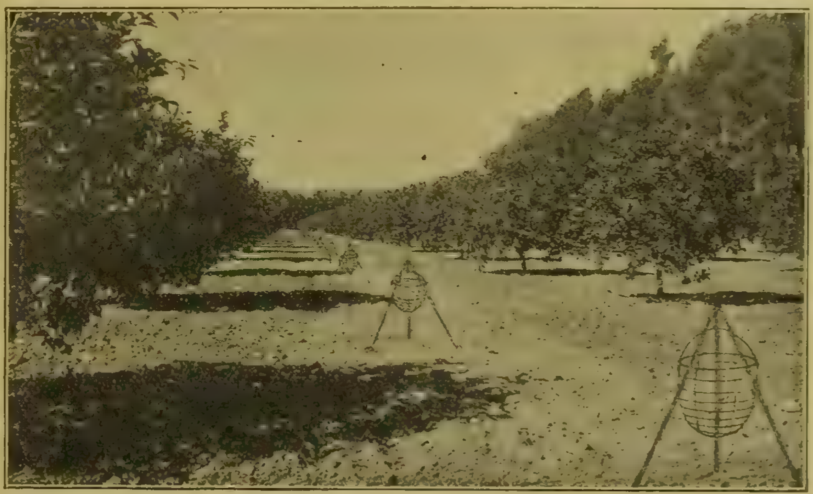
For several years following these preliminary experiments which began in 1897, considerable attention was given to frost protection. One method which was tried by Mr. Everest at Riverside was the covering of his entire orchard with lattice work. This proved expensive in construction, and while protecting from frost, was ultimately taken down. We may say that this style of protection is the only one used in the lemon orchards of Southern Italy. The best lemon sections of that country are visited practically every year by frost. A framework is constructed as depicted in the illustration on cover of this issue, and at the approach of the cold season mats of straw are placed over it, giving the requisite protection.

Partial Exemption.

The next few years following these experiments, fortunately, or unfortunately as the case may be, brought warm winters. These favorable seasons, together with hesitation to incur expense necessary for frost fighting, induced many to gamble on the probabilities of exemption, so that until this year most growers have neglected to make provision for frost insurance. The last two winters, however, have taught such a severe lesson that now many are asking where they shall turn to secure the greatest protection for the least money.

Methods.

Several methods have been tried, running all the way from irrigation in the hope that the latent heat of the water would modify the temperature sufficiently, to heating with 25 to 100 fires per acre. Running water through the orchards at night has been found to give a slight degree of protection, but owing to the fact that an entire community cannot do this at one time, it is not practicable. In addition, many prefer to store the water in the soil, giving clean cultivation at time of cold weather.



Coal Baskets Arranged in Orchard.

A coal basket built so as to hold ten to twenty-five pounds of ocal, together with proper amount of kindling and sometimes a little charcoal, is used probably as largely as any method. The oil pot, of which there are many kinds, is being used, especially in the deciduous orchards of the Northwest where it is necessary to protect against spring frosts at time of blossoming. Evaporating pans supposed to give off sufficient steam to modify the cold have never been used to any extent. Along the same line, the building of distillate or oil fires underneath a network holding wet straw or wet manure in the hope that this combination of heat and steam would be successful, has been abandoned. The use of wood or brush fires has never been followed in California, although in the Northwest, especially in the Hood River section, this seems to be almost universal. For a few years many orchards were stocked with briquettes composed of shavings and asphaltum or a heavy crude oil pressed into a compact mass, and said to light and burn readily lying upon the ground. This looked attractive owing to doing away with the necessity for providing stoves and appliances, but their use has been entirely discontinued. The same kind of fuel is now being used in a loose form in specially constructed stoves. We notice that in the Northwest another fuel is used, sawdust and coal tar. This is not so popular as the shavings saturated with crude oil and stored in paper sacks ready for distribution. Instead of shavings, one grower has made a success of using pine needles and other forest refuse. The use of eucalyptus litter saturated with crude oil has been discontinued because it burns out too rapidly.

Be Prepared.

If it is wise in time of peace to prepare for war, it is likewise wise in time of war (mth) to prepare for peace (of mind) when it is cold. It is none too early to take up the consideration of the possibility of a visit from Jack Frost in the coming December and January. The only possible exemption is secured by preparation long in advance. No matter how much concerned the grower may feel the day before a cold snap is promised, he cannot then get ready for the unwelcome guest.

To secure information from our practical growers we have asked a number to give us of their experience. Unfortunately, most of those to whom we applied have had no experience. Some have asserted that being in a frostless section they have no occasion to be concerned over the subject. Those who are so favorably situated will have no interet in the present article. We note that others who at one time felt the same assurance are now preparing for the emergency. Amongst those to whom we have applied for information are

O. B. Griffin, Superintendent, and F. W. Gray, Foreman, of the Leffingwell Rancho at Whittier, Los Angeles County.

The following facts were gleaned from a few minutes interview with these gentlemen. Mr. Griffin frankly admits that he was at one time one of those who "lived in the frostless belt," but today he knows the advantages of being prepared for the emergency.

The work on the Leffingwell Rancho has been peculiar in this, that firing is always begun at a much earlier stage than in most other orchards. The cold is never allowed to actually injure before the firing is commenced, but as soon as the temperature reaches 30 or 29, close watch is kept. If the leaves are covered with moisture and if the water in pans on ground by trees is not scaling over with ice, the firing is not begun. The water pans, by the way, are common tin piepans with a film of water kept over the bottom, and the moment these show the least formation of ice, the firing starts. The thermometer

serves only to point to the danger rather than to indicate time of beginning work. On this ranch a fuel of shavings and heavy oil has been used in the common smudge fuel stove. Mr. Gray, who has charge of the frost protection work, says that he has used oil pots but this year will use smudge fuel and the coal fires, a large number of baskets for which have been purchased. Number of stoves used to the acre up to this time has been 25, but it is proposed to supply 100 acres of lemons with 50 stoves or baskets for each acre. This will allow 25 fires to be started at first, holding 25 more in reserve.

One effect of the firing at the first indication of ice formation, is protection of the tenderest growth and keeping the trees in perfect condition. This may seem to many an unnecessary expense. In fact, it appeared so to the management of this ranch when they fired five different nights within one week, but the large output of lemons from those trees and the big prices secured from their sale this year, have made it one of the best investments possible. With the limited number of stoves employed, a change of four to five degrees has been effected.

The following valuable points were given to us by Mr. Gray: Fuel of shavings and oil is more liable to give dense black smoke and deposit smut on fruit if used soon after its manufacture. A less dense smoke and equal heat is secured if the fuel is mixed two or three months in advance and "cured." Again, the firing in the more exposed sections of the orchard is begun first; if possible, on the side from which the air is drifting, so as to carry the smoke and heat over the orchard. Some nights it was found that fires distributed along the outer edges of the orchard were sufficient to protect the middle where there were no fires at all. Thirty men lighted and had in full operation 2500 fires within 40 minutes from the time they were called out of bed. It is best to use the heaviest smudge of the night's campaign just before sunrise so that the orchard can be protected with a dense smoke to prevent injury from the early sunshine.

The following observations were made and forwarded to us by

R. H. Forbes, Director of Agricultural Experiment Station, Tucson, Ariz.

I will say, in connection with observations of our Mr. Simmons made at the almond orchard near Mesa, Arizona, of which he had charge for several years, that the following is a summary of his experience in that connection:

Smudging almonds was effective in preventing damage by frost. Various fuels were used including orchard litter, horse manure, cow manure, almond hulls, straw, old hay and coal tar.

Horse manure with straw enough to keep it from settling into a compact mass gave the best results. This combination gave a quick smudge while fine horse manure alone gave a good but slow smudge.

No sooting effect was, of course, observed upon the almonds which are hulled before marketing. Mr. Simmons' practice was usually to locate the fires 40 feet apart each way but on extremely cold nights he placed them at a distance of 20 feet each way.

The fire was usually begun when the thermometer sank to 35 degrees, this being governed to some extent by judgment, velocity of wind, etc. When the temperature was falling rapidly and the danger seemed unusually great, Mr. Simmons sometimes started the fires at 38 degrees.

It was found desirable to fire pretty heavily on the side from which the wind was coming and he so timed his operations as to have a good smudge in active operation by the time the freezing point was reached.

Mr. Blanchard, pioneer fruit grower of Santa Paula, Ventura county, has had wide experience in frost protection, and gives the following:

Nathan W. Blanchard, Santa Paula, Ventura County.

Several years ago I used oil pots but am now using coal baskets, and with their use have found no injury to appearance of the fruit by sooting. The number of fires per acre to be used to give best results depends upon the temperature. I have baskets under every tree and have never lighted more than three-fourths of them; generally one-fourth to one-half the baskets will suffice. The time to begin firing is determined not simply by temperature readings, but by condition of foliage, freezing of water in pans, etc.

Burle J. Jones, Phoenix, Arizona.

Mr. Jones writes that the nurseries and orchards of the company he represents at Phoenix will be protected the coming winter by the coal basket method. These have been considered the most effective in Arizona.

C. C. Teague, Santa Paula, Ventura County.

Mr. Teague realizes the seriousness of the situation, and is one of the pioneers in the study of methods of frost protection. There is no one method which is best for all sections. Each orchardist must study his own conditions and his own problems, and these problems must be solved to secure the best California fruit. Mr. Teague begins his work as soon as the thermometer reaches 30 degrees. He then watches condition of exposed water pans, and as soon as ice begins to form, starts firing. He also depends upon the appearance of leaves, especially the younger growth, in determining approach of danger point. He realizes the value of plenty of smoke over the trees, but that this is not sufficient to depend upon. One observation made by him is that the danger point is often passed very soon after the fires are all lighted, and under these conditions a rise of temperature of ten degrees has been registered. Mr. Teague has used both coal and oil, but now uses more largely the coal baskets, of which he has 16,000 for 160 acres. These he has used for the past ten years. Seventy-five baskets per acre he considers safest. He first lights one-third, then another third if necessary, but it is always desirable to save one bunch to be lighted to secure smudge from the freshly started coal just before sunup. In the Limoniera the only service of the thermometer is to warn the grower to be on the lookout. Actual firing does not begin till the tender growth and water in the pans indicate the necessity, and then only in the colder portions of the orchard.

Mr. Teague urges that the most essential thing in frost fighting in sections of small orchards is co-operation. The growers must unite and make a general campaign if best results are to be secured.

Scientific Frost Observations

An Address Before the Claremont Club at Its Pomona Meeting. By Alexander McAdie of the U. S. Weather Bureau.

FOR fourteen years a progressive campaign has been waged by Fruit Growers and Weather Bueau officials in California, having or its purpose the protection of citis fruits from injury by frost. Varius devices for preventing injurious emperatures have come into estabshed use. Much satisfactory work as been done and the whole problem f protection developed so much that roadly speaking the question has eased to be one of local interest on- and become one of national imortance. If the general principles id down are correct in the case of itrus fruit protection, the same can e applied with success in other tates and with other crops, making f course due allowance for the hanged conditions and new occaions. Before taking up in order the hysical processes involved in frost ormation it may not be out of place recall the conditions of last winter n the San Gabriel Valley, or better et throughout Southern California. ear the close of December, 1909, e citrus fruit crop of the state had prospective yield of 36,000 car ads or more, about one-fifth of this rop being lemons. The low temperture of the first week in January aused a loss of perhaps 25 per cent f the crop. One peculiar feature of e experience was this, that during e whole winter there was no failre on the part of Weather Bureau fficials (the statement is made with ll due modesty)to give ample and rgent warning of the impending rosts. This may be considered as quivalent to half the battle won and a matter of proper congratulation hen one recalls the uncertainty of arlier years. Responsibility for the rge loss must in some measure be laced upon the growers themselves ho had become I fear somewhat ver confident, and so were not fully repared to meet the extreme condions of the first week in January. is a matter of regret also that ere was no systematic equipment f the groves with recording therometers and hygrographs, so that eliable temperature and humidity ata could have been obtained for se in future plans for protection.

ecure Instruments.

I believe it would fully repay the itrus fruit growers of California to urchase and install at least twenty hermographs and hygrographs in the an Gabriel Valley. Better yet I ink it would be to organize a rost Commission which could superise the installation of about twenty aturation Deficit Recorders, a new nstrument designed especially for he use of fruit growers; and the acion of which will be explained later. uch a commission composed of ruit growers, with the Weather Bueau officials as honorary members ould, I think, at an expenditure of 2000, throw more light upon the ovement of the air in the valley, he injurious temperatures, the daner spots and the most efficient agenies for preventing injury by frost, han we could hope for with our preent equipment for many years to ome. I do not hesitate to say that while in some years losses might be small there will come seasons when the savings accomplished by our better knowledge will make the expenditure seem but a drop in the bucket.

Temperatures.

The frosts which did the damage last winter were those of December 19, 1909, and January 3, 4, 5, 6, 7 and 8. In portions of the San Gabriel Valley the temperature fell as low as 24 degrees F. (4 degrees C.) or 269 degrees on the Absolute scale. I think this may be taken as fairly representing the air temperature six to ten feet above the ground on the morning of January 6th, about the hour of sunrise. As there are not thermograph records, the rate of fall after sunset, the time of the minimum and the number of hours when the temperature was below 32 degrees cannot be stated with precision; nor are there any records available whereby we could give the humidity of the lower layers of air. Of course new growth or a tender condition of the tree has also to be considered. Every orange grower knows that a tree that is backward or is not in a tender condition, other things being equal, will show less injury.

Again for reasons which will be developed later it is of prime importance to know something of the exposure of the chilled fruit to the sun's rays in the morning, that is to say, we must know something about the character of the rise in temperature after the frost. Such records during the period under discussion would have been of the greatest service. Lacking these we are compelled to rely upon data obtained in cities and towns. It is interesting to note that on the morning of January 6th the minimum temperature recorded at San Diego occurred about 6:30 a. m. and was 2.5 degrees above the freezing point. This was the lowest temperature recorded at the station since February 6, 1899.

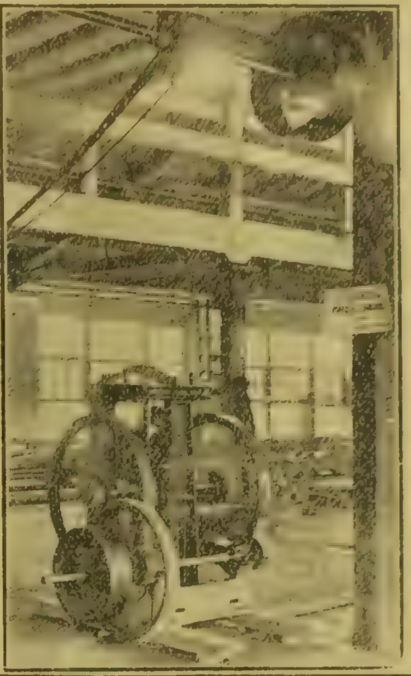
The lowest temperature at Los Angeles was 33 degrees January 5, 6 a.m. The ground temperature was probably 10 degrees lower, that at San Bernardino was 23 degrees Jan. 6, Riverside 27 degrees Jan. 9, Redlands 25 degrees Jan. 6. Temperatures recorded on roofs of city buildings are from 6 to 10 degrees higher than temperatures in the groves. In some experiments made by the writer under typical frost conditions, it was found that the air about 3 feet above the ground had a temperature of 35 degrees while that of the ground was 32 degrees.

Condition of Tree.

As before stated much depends upon the condition of health of the tree and the age and character of the fruit.

In general the typical dangerous temperature curve will be about as follows. A nearly uniform rate of fall from early afternoon to midnight, a slight check about midnight and nearly constant temperature until about 4 a. m. Between 4 a. m. and sunrise a drop of 2, 3, or even 4 degrees. Then a slow rise half an hour

The Luitwieler Non-Pulsating Pumping System



Best For Deep Well and Irrigation Work

Pump Talk Continued:

The cam principle is now universally conceded to be the most perfect mechanism for lifting water from deep wells or against pressure. Luitwieler Pumps are the result of [illegible] years of experience and embody the perfection of the cam principle. The mechanism is balanced and all pumps are tested for smoothness of operation before leaving the factory.

The cut shown here is that of one of our 18 inch Double Geared Pumps, being driven by only a ½ inch belt lace. The weight of the revolving parts is 3200 pounds. This test is not possible with any other type of pressure pumping mechanism, not even the much advertised Triplex.

Luitwieler Pumps are in a class by themselves. 32 years of experience in Los Angeles with pumps and irrigation. Send for our catalogue.

after sunrise and if the air is clear and dry, a rise at the rate of 3 degrees an hour until 8 o'clock.

Essentials.

The general campaign of frost fighting as thus far developed in California and adopted in other state of the Union with suitable modifications, covers three main lines:

1. Accurate advance information of the likelihood of frost.
2. Application of preventive means during critical hours.
3. Guarding the fruit after the low temperatures are passed.

Under the first head the fruit grower has now little more to do than keep in touch with the nearest forecaster. He may if he so desires study for himself typical frost maps for his locality.

As pointed out by the writer many years ago in the Bulletin upon "Frost Fighting" issued by the Weather Bureau, frost is largely a matter of air drainage. Frosts are found to occur as a result of certain movements of low and high pressure areas over the Pacfiic slope. There is a displacement of the lower air incident to such changes, both on a large scale and on a small scale; and I would suggest that the orange growers of San Gabriel Valley study the movement of the air in that valley, and that each grower determine for himself and to his own satisfaction the drainage of the lower air in his locality. The condition to be anticipated for injurious frosts is one in which the lower air strata will be camparatively still, the air dust free and pure and the humidity low; i. e., very little water vapor present and the subsequent rapid radiation from soil and plant. The grower can, I believe, after a little experience with the new Saturation-Deficit instrument determine the amount of water vapor present in grams per thousand cubic feet of space and thus estimate the probable effect of this factor in retarding the fall in temperature. For many years we have held that the likelihood of frosts could be determined in advance by observations of the dew points in the early evening. Recent experiments, however, by officials of the Weather Bureau and others have shown that this cannot be relied upon.

Conditions Vary.

It may, however, be pointed out that conditions in other localities may be so entirely different from the climatic conditions of this valley that conclusions reached elsewhere may not be applicable here. In a recent work on Meteorology Professor Cox of the Chicago Weather Bureau office is quoted as believing that the temperature of the soil is a most important factor in the control of night air temperature in the bogs; and that for example, frosts occur in bogs in May and even in June under atmospheric conditions that would not produce frosts in the midsummer months, due to the fact that the soil is much colder in the spring and early summer, than in midsummer. However, it seems to us that the problem is one chiefly of air drainage; and that the individual fruit grower of California will find that where there is little air motion, or in other words, poor ventilation, frost conditions are most marked.

A Difficult Problem.

Air is a poor conductor of heat and there is not much warming of fruit by direct conduction of heat through the air from some distant heat source. This explains in part why fires are not as effective in orchards as might be expected at first glance. In a paper read before the Fruit Growers' Convention at Watsonville attention was called to the experience of one of our best fruit growers who during the night of December 20-21, 1908, burned about fifteen cords of wood and forty tons of wet hay in an unsuccessful effort to protect the orchard. For thirty-six hours the temperature did not rise above 28° F. and for fourteen hours ranged between 19° and 24° F. It was noted that there was little air movement and the smoke rose "as straight as a pine tree."

Small or Large Fires.

Plainly in such cases as the one just quoted a large amount of heat is lost. Numerous small fires or heaters are much more effective than a few large fires; but none the less it is evident that there yet remains to be patented the ideal heater, one that will not only give heat in sufficient quantity; but one that is in some way combined with a fan, or blower, so that the air will be thoroughly mixed. In plain English, the problem is to convey the warmed air from the heater to the tree tops. It is only necessary to do this for a few hours whereas many hours of firing or heating will not suffice if the heat is carried away by some ascensional current. It is I think something of a mistake to keep the various devices known as coal baskets, oil pots, orchard heaters, etc., on the ground. To get the highest efficiency these should be placed nearer the fruit and provided with larger radiating surfaces than those now in use.

General Principles.

Regarding the various devices now on the market, opinions will differ concerning the relative efficiency of each and without doubt some will do better in certain localities than others. The three great principles underlying the construction of all present devices are:

1. Heating.
2. Covering.
3. Ventilating.

Under the first are included all forms of fire baskets, oil pots, orchard heaters, etc. Under the second head are cloth covers, lattice work, artificial cloud building smudge makers and the new anti-frost cover. Under the third head would come blowers, wind mills and air mixers.

Coal.

The first use of coal in baskets for the specific purpose of protecting orchards was by Edward Copely of Riverside, California, about 1896.

Oil.

The first use of oil, that I know of, was by Everett at Arlington, Cal

Hot Water.

The first use of hot water was b Meacham of Riverside.

Steam.

The first use of steam pipe through an orchard was by Wrigh Brothers of Riverside.

General Application.

One of the earliest applications of modern protective methods on a larg scale was at Santa Paula, by Mr. E W. Blanchard. Indeed the work of the Riverside Horticultural Club from 1895 to 1898 may be said mark the beginning of our work in frost protection. Many experiments were made by such men as Reed, Holmes, Hall, Koethen and other orange growers of Southern California. The work has gone on and we have seen many improvements since; but it is none the less a pleasure to recall the efforts of these early workers.

Covering the Orchard.

Under the second head, namely, covering, the purpose is of course to save heat. We utilize wherever possible any natural source of heat. Naturally this must be in the long run the most economical method of protecting. The earth's heat is conserved by entrapping it. Any cover spread above the ground interferes with loss by radiation. To be thoroughly effective the cover should be spread before sunset, or in other words, before the earth has lost much of its heat. Covering is probably the most effective of all methods. The chief objection, however, is the expense of covering large areas. The cover or shield, has a great advantage in this, that it serves after sunrise as a guard against the too rapid warming of the chilled plant. We have examined many orchards in California and find that fruit is most frequently injured where exposed to the direct rays of the sun. Some rough experiments made by the writer on frosty mornings showed a rapid warming of the side of the orange facing the southeast. While this may not be the true cause of injury it is a reasonable assumption that the cell tissue is subjected to unusual strain under such conditions. Another important consideration is that of the water content of the fruit. In California the most dangerous frosts are as a rule preceded by ten or more hours of boisterous north winds, quieting down at nightfall. These winds rob vegetation of much of its natural moisture and also dry the surface soil to a marked degree. The specific heat of both soil and plant are lowered, the loss of heat by radiation is greater, and in other ways the action is an unfavorable one. The point I would make in this connection is that both tree and fruit are not in their normal condition at such a time, and are less able to withstand the temperature change.

Under the third head, ventilation, there are no special devices at present available for mixing or stirring the air. When Nature mixes the air, that is on windy nights, frosts do not occur.

Yet to Come.

Finally, in our opinion the ideal frost protector is yet to be made. It ought to be a combination of cover, heater and ventilator.

As an aid to more definite information, Mr. McAdie suggests that cards similar to the following be filled out and sent the Weather Bureau office.

Fruit.	Injured if temperature falls to—		Injured if temperature is 32° F. or below. Hours.	Injured if temperature rises from 26° F. to 36° F. in— Hours.
	Ripe. Degrees.	Half-ripe. Degrees.

Frost Warnings

By A. B. Wollaber, Forecaster, U. S. Weather Bureau, Los Angeles.

IT IS a true saying that over-confidence often leads to carelessness, and this seems, unfortunately, to be only too true as regards the protection of our citrus groves against injurious conditions arising from low temperatures. While concerted action is taken among horticulturists to guard against the ravages of insect pests, there is no general or widespread co-operation among the growers when it comes to frost protection. Though it is true that many individual growers still use protective measures during cold weather, the fact remains that frost protective measures have largely fallen into disuse during the last few years, principally due to this over-confidence. This appears to be the history of every cycle of warm years. The ranchers make ready for smudging after they have been frozen two or three times, and neglect the necessary precautions when there has been immunity from frost for a similar period. They become like the man who boasted that when he lived through the month of March he always lived through the year, but lost out the next year by dying in February.

With the experience of the last two winters fresh in our minds, some effort ought to be made to revive interest in the possibilities of frost protection, especially with a view of securing a more thorough co-operation among the growers in this important work, and it seems not out of place at this time to bring up the matter of frost protection by inviting attention to the methods employed by the Weather Bureau in the dissemination of frost warnings in this section, and acquainting those not familiar with the work as to how these warnings are made and how they can be obtained.

Several factors are involved in the problem of protection from frost, and for the grower probably the most immediately important of these is the issuance of adequate frost warnings, and it is this particular phase of the question with which we have chiefly to deal in this article. We know that there are certain physical changes constanly taking place in the atmosphere, each change being in turn the effect of a previous change and the cause of a subsequent change. Furthermore these changes are susceptible of record by certain delicate instruments specially designed for this purpose. The Weather Bureau keeps a large force of employes constantly on duty watching the action of these instruments and noting the changes that occur in the weather from time to time as indicated by them. At certain designated hours the information thus obtained is sent to all regular Weather Bureau stations by telegraph, and from this information impending weather changes are foretold. Whenever the conditions warrant, these forecasts contain special warnings of high winds, cold waves and frost. In the matter of dissemination of frost warnings the telephone and telegraph are extensively used, while a great number of persons are furnished with the information by cards and maps sent through the mails. The regular forecast card contains the information that frost is expected in the locality covered by the forecast, on the following morning, and this card is usually ready for mailing shortly after eight o'clock in the morning. In addition to these cards a special forecast is sent to certain

Here They Are.

THE Tee Irrigating Valve

Simple in design and construction, costs less and will last longer than any other on the market.
The Tee Irrigating Valve is made of an ordinary malleable iron T with a brass plug. It is designed for those who want an inexpensive irrigating valve, especially where such valves are needed in large quantities. There is nothing to get out of order. It is so simple you will wonder why it was never thought of before.
A ½-inch valve sent post paid upon receipt of 40 cents. Quantity price, circular and full information upon request.
Address **George C. Roeding, Fresno, California**

districts. This is a short talk with the grower, so to speak, and in addition to the bare information that frost is expected, a forecast is made as to what degree of cold is probable. The following is a sample of one of these special forecast cards:

"Los Angeles Cal., Date,--------

"The pressure and temperature distribution over the Pacific Slope this morning indicate colder weather and heavy frost over the citrus belt Tuesday morning. The temperature in most sections will range between 26 degrees and 30 degrees according to location. Fruit growers are advised to watch carefully local conditions and be prepared to smudge or fire early."

These cards are ready for the first mail leaving Los Angeles for the fruit belt.

There is probably no part of the country more liable to sudden and marked changes in the weather than California. Our proximity to the Pacific makes it difficult for the forecaster to accurately judge the extent and future movements of the pressure elements affecting the weather in this section, and for that reason unforeseen changes often occur in both weather and temperature at certain periods in the winter season when the citrus fruit is in a critical state. In order to be prepared for these sudden changes arrangements have been made by which the local office is in constant communication with the several fruit exchanges scattered over the fruit belt, and in a comparatively short time a special frost warning can be sent to all these exchanges by day or night, and the managers will see that all interested receive the warning. The telephone companies also co-operate with the Bureau in the free distribution of all warnings, and any grower can receive the forecast by calling up his local exchange any time after nine a.m.

It will be readily seen by the foregoing that the territory is pretty well covered so far as the distribution of the frost warnings of the Weather Bureau is concerned. Professor Willis L. Moore, Chief of the Weather Bureau, has been exceptionally generous in his allowance for expenditures in extending and improving the service in this section, and there is no reason why every grower who needs the information and is in a position to make intelligent use of it, should not have ample warning of the approach of damaging temperature conditions.

In conclusion let me say that the Weather Bureau makes no charge for this information, and the special warnings will be sent to all growers making application for them. See that your name is on the mailing list of one of our Weather Bureau offices. When you are in a city where a Weather Bureau office is maintained, spare a few moments, visit the office and become acquainted with the officials. Tell them the needs of your community, and by an interchange of ideas a great deal of good may be accomplished.

Dairymen near Ferndale are short on milkers.

The Weather Man

THERE are many jokes at the expense of the weather man. Being human, he sometimes makes mistakes. Being fickle, the weather sometimes makes mistakes and violates all rules and precedents. When these mistakes—of the weather—occur at a time when the world is watching, as on last inauguration day, a cry on the part of a few goes up that the service is worthless. But we believe appreciation of the Weather Bureau's work on part of most fruit growers is such that nearly any other feature of the Department of Agriculture would be dispensed with before that of the Weather Bureau. The work of this particular service has secured such a name with scientists of the world that many other nations have sent of their ablest men to study it.

This Bureau is under the direction of Willis L. Moore, chief, with an army of observers and assistants at the service of farmer, ship owner or any who may be served. There are 2334 distributing stations from which are sent out information to over 3,690,220 addresses by mail, rural delivery, phone, telegraph and special railway service.

There are nine stations in this state, located at Eureka, Red Bluff, Sacramento, San Francisco, Fresno, Independence, Los Angeles and San Diego. Besides these are sub-stations and others like the station studying evaporation at the shore of Salton Sea.

The Los Angeles station has been of inestimable value to the citrus growers of that end of the state. Its service has been made more complete and available by the Exchange organization with its connection with members through the extensive telephone system. Within a few minutes from the time the weather office warns the Central Exchange, every citrus section knows of the impending danger and is prepared to fight.

The Los Angeles office is in charge of Mr. A. B. Wollaber, one of the me who extends a welcome to every inquirer who visits his weather shop in the Central Building, corner of Main and Sixth Streets.

The layman can only look wonderingly at the confusion of clicking instruments, thermometers, guages, etc., but the perfect organization may be at least admired. Electric wires connect various recording instruments with the thermometers, barometers, and guages on the roof. The records of these instruments are wired to Washington and to other stations daily.

In an adjoining room a complete though small print shop is equipped for rapidly printing and mailing weather maps and reports of weather conditions. At Pasadena, San Bernardino, Redlands, Riverside and other points are sub-stations.

This service is absolutely free all who wish it and it is the fru grower's fault if he is not securin advantage of it.

Alexander McAdie is in charge o San Francisco and its many sub-stations and his work in behalf of frui growers has wide appreciation.

This issue contains articles by both Mr. McAdie and Mr. Wollaber.

DANGER POINT.

The Missouri Board of Agricultur has figured out the following dange point for peaches. When the temperature drops to those points the pots should be lighted:

Buds appreciably swollen; zero Buds showing pink, 15 above zero Buds almost open, 25 above zero Flowers newly opened, 26 above zer Petals beginning to fall, 28 abov zero. Petals off, 30 above zer Shucks (calyx tubes) beginning t fall off the young peaches, 32 degree is the danger point.

The same rule will apply for apple This frost fighting is actually bein done in large areas and in a practic way. Drainage gives man dominio over the soil, irrigation permits hi to command the rain and the oil coal pots let him defy Jack Frost.—Rural New Yorker.

Ventura is proceeding in the buil ing of its good roads. There is som contention because of failure to pr vide a road to meet the newly co structed road in Los Angeles count which passes through a tunnel in t mountains near Newhall.

Porterville is after a cannery a other fruit processing concerns.

The Frost Problem

IT WOULD SEEM needless at this time to urge upon the orchardists of Southern California the necessity of adequate protection against frost. Speculation as to the future aside, it is a stern admitted fact that "Jack Frost" created havoc in the orchards last year, and but one question now presents itself to the grower of citrus fruits, namely, "How can the crop be saved?"

A year or more ago the writer, in the columns of this paper, urged upon the orchardists the need of "Frost Insurance," and presented the subject with some detail as to cost. All that was then said might now be repeated, but meantime the situation has become more serious than most of us care to admit, and, call it what you will, something must be done by those whose orchards are within the limits of the danger areas, if marketable fruit is to be harvested. It is almost amusing to hear the owner of a little orchard argue with convincing clearness (?) that frost cannot visit his ten acres, and, the while, admitting disastrous ravages in neighboring orchards, with only an unseen dividing line between. Until last winter one might almost have been pursuaded that the keeper of low temperatures had his favorites in Southern California, and possibly his enemies, but it is no guess work to say that the "frostless belts" have, within the past year, shrunk to proportions much more easily measured than in former years.

The writer has no desire to push this view of the subject any farther than may serve the purpose of opposing what too often seems a false and dangerous feeling of security. The experiences of the past season ought to carry with them the lesson that frost in Southern California is a very cold fact to be dealt with, and not a theory for speculation.

THE QUESTION OF COST.

Two views of this matter may be had, namely, initial cost, which includes the cost of a necessary equipment of stoves, and average annual cost, for a series of years. Putting it briefly, the writer estimates the cost of stoves at from $12.00 to $15.00 per acre (including freight), according to distance for shipment, and number of stoves per acre, and the average annual cost, for stoves and fuel, at not to exceed $10.00 per acre for adequate protection. In arriving at this result no account is taken of labor in the orchard, which cannot well be estimated, and it is assumed that some years the cost will be more, and others less, and some nothing. An average of three burnings a year is also assumed, and 25 or 30 stoves to the acre. But many orchardists who should have frost protection balk at the cost of equipping with stoves. It is unfortunate that some other and less expensive, and, at the same time, effective device has not been produced, but, numerous claims to the contrary, it remains a fact that the stove and oil-soaked shavings is at once the best and cheapest means of saving fruit and trees from damage by frost. All other methods either fail to do the work satisfactorily, or cost more for both materials and labor in using. To illustrate: The oil pot method using 100 pots to the acre, requires 100 gallons of oil for a single burning. The same quantity of oil, with shavings added, will make fuel enough to protect four acres for the same length of time.

GET READY IN TIME.

"Time by the forelock" should be the watchword of the orchardist this year. He who waits till frost comes, just to see whether it will come or not, is going to be too late when it does come. Nor is it safe to gamble on its not coming. With a valuable crop on the trees, too much is at stake, and here is a form of insurance where, unlike life insurance, one does not have to die to beat the company. The cost is moderate and protection is sure to the man who will rightly use the means to be had. In this connection it must be admitted that no equipment, whatever its form or cost, will protect unless it be faithfully and intelligently used. When the thermometer registers around thirty degrees it is time for someone to get busy, and keep busy till all danger is past. An extra supply of fuel should always be on hand, and it is better to burn more than is required than not enough. But the one urgent need is to be ready when the danger hour arrives. To this end orchardists are urged to supply themselves with stoves and fuel months in advance of expected need. Car-load shipments mean less freight, and if near neighbors join in ordering, shipments can always be made in car lots—at $1.75 per ton (for fuel) from Los Angeles to points east as far as Riverside and Redlands, South into San Diego county and North well into Ventura county.

CORRESPONDENCE AND SUGGESTIONS INVITED.

The Occidental Fuel Company, with offices at No. 201 Douglas Building, Los Angeles, has been endeavoring for several years to meet the demands of Southern California for frost protection, and has always welcomed, as it now does, correspondence and suggestions from orchardists. This company now offers its improved and simplified stove at a reduced price, and in future will beneficiate its fuel by the addition thereto of about twenty per cent of fruit pits, which adds greatly to the heat-producing quality of the fuel, and makes it burn longer. This improvement in the fuel will be appreciated especially by those who know that heat is of greater value than smoke in battling with frost. The price of the fuel will remain the same as heretofore. An experience of three years has demonstrated that it can not be sold for less. With crude materials at hand, and therefore the cheapest to be had; with an extensive plant for manufacturing, and with the most economical management, this company has been able to realize only very moderate profits.

The foregoing statement is made to set right those who have thought its prices too high.

All inquiries, either by letter or phone, will receive prompt attention, and again the necessity for early orders is urged upon all who desire to equip for protection against frost. Remember, "time by the fetlock" is bad business if you have a crop to save.

No Hoof, No Horse

U. S. statistics show that 80 per cent of all horses are lame and that 80 per cent of the lameness is caused by hard and contracted feet. As a hoof softener, toughener, nourisher and grower there is nothing equal to

Eshelman's Wool Fat Hoof Healer

A horse's hoof is from 60 to 70 per cent water. Grease and water will not mix. There is no grease about Wool Fat. It mixes readily with water, is very penetrating, and while a great medicine of itself, it also acts as a vehicle to carry to the afflicted parts the other medicinal properties of the HEALER. It is absorbed into the skin and gives natural stimulation and nourishment to the hoof. There is nothing that can compare with it for this purpose, nor as a remedy for contracted hoofs, split hoofs, quarter cracks, mud fever, corns, grease heels, and for all kinds of sores and cuts anywhere on any stock. If you have tried it, you know that this is true. If you have never tried it, it will surprise you with its power as a healer and restorer. It is not a new remedy, but has been on the market in the East for many years, where it has given the greatest satisfaction.

4 oz. package, 25c; 12 oz., 50c; 32 oz., $1.00; 5 lb. pail, $2.00; 10 lb. pail, $3.50. It is easy of application. Directions with each package.

TRIAL OFFER.

We will send you a 2-lb. can, use it 15 days, and if satisfactory, send us $1.00. If not, write us to that effect, and you need pay nothing. We take all the risk, you just try it. Send for it today.

SAN DIMAS CITRUS NURSERIES R. M. Teague, San Dimas, Cal.

Fighting Frost in Colorado

THE late spring frosts of 1907 caused the loss of the larger part of the crop of the Rocky Mountain region. This set the growers to thinking along the line of protection from frost injury in the orchard. The old-time theory of making a cloud of smoke over the orchard to prevent radiation was experimented with in many of the orchards during the following summer. This practice soon gave place to an effort to actually warm the air of the orchard by the use of small fires. The following years, 1908 and 1909, brought late frosts again that in some sections did much damage. Peaches suffered most both years. There is no doubt that many orchards of both peach and apple in Colorado were saved, or at least made larger crops both these years by the use of heat in the orchards. A great deal has been said, and many extravagant statements made in regard to this work of orchard heating. The Colorado Experiment Station has made some experiments and collected what data was possible concerning this work. The practice of heating has not been carried on long enough and the different methods experimented with enough so that we can determine all the details for the most efficient system.

The first thing tried was the burning of trimmings and other rubbish in piles in the orchard. This method was entirely too uncertain to be reliable for, though Colorado has the reputation of being always sunny, a late spring frost is very apt to be preceded by a storm that makes the brush too wet to burn. Making fires at given intervals on the ground also had its drawbacks, owing to their not being easily controlled. The next step was the heat or so-called "smudge pot." It was soon demonstrated that fuel, as coal or oil, confined in an iron receptacle could be better controlled and made more efficient and reliable. Much difference of opinion still exists as to details in form and size of these receptacles. There are many companies in Colorado making these pots.

An investigation of this problem was started on the west slope in the Grand and Uncompahgre valleys, and on the east slope at Canon City at about the same time. At Canon City a committee was appointed by the chamber of commerce that made experiments during the summer. The facts brought out then were used the two following springs with success. Of the various methods tried there the oil pot seemed to have become the most popular. The pot consists of a simple sheet-iron can holding from four to eight quarts. From 50 to 150 of these were used per acre. Some difference of opinion exists among the growers as to the number per acre. About 100 per acre is the number that has been most used, but many growers think that 150 should be used to insure success. It is probable that a great deal depends on the number of degrees of heat that are required to keep the orchard above freezing point, and also the condition of the blooms at time used. The fruit seems to have least resistance to cold when the trees are in full bloom. Where 100 pots per acre were kept continuously burning during the night the temperature was raised from 2 degrees above zero to above freezing point.

At Delta and Grand Junction, where letters were sent out asking for the results of their work, it was found that out of 40 answers the average number of pots used per acre was 6 for oil and 59 for coal. The average rise in temperature was 7.5 degrees F for the oil heaters and 6.5 degrees for the coal heaters. Most of the times when the heaters have been used in Colorado in the past two years the wind was blowing. The same degree of success could not be expected in those cases as when no currents of air prevailed. That some of the growers did succeed under those adverse conditions is an undisputed fact, for in several instances the crop was saved when neighboring orchards similarly situated had practically a total loss of crop.

The cost of preventing frost injury in this way is hard to estimate. It is necessary to have not only the required number of pots on the ground when the frost comes, but sufficient fuel, either coal or oil, must be immediately available for use. Less help is necessary where the oil is used, as the oil is more easily and quickly fired, and if refilling is necessary it is more easily done. Capt. B. F. Rockafellow of Canon City, for 35-acre orchard paid $1,035 for equipment, which consisted of 3,500 pots and a steel tank for storing the oil.

A considerable difference of opinion prevails as to when heating is necessary. Heat was applied from two to four times in many orchards last spring and a full crop obtained. Some orchards nearby these were not heated at all yet secured a crop. It is quite probable, however, that at least some of these negligent growers reaped the benefit of the work of their more careful neighbors. The feeling among many of the better growers is that it is safer to heat once in a while when it proves to be unnecessary than fail to heat when the crop will be lost without it. Consequently, we may sum up by assuming that orchard heating is a matter of insurance, much the same as spraying potatoes in the East for blight.

As yet we have no means of knowing just what temperature will produce injury to the fruit. Probably much depends upon the amount of moisture in the air, the rapidity of the fall in temperature and the corresponding rise after the freeze, as well as the condition of the buds, blossoms, or small fruits, at the time of frost. Some time when agriculture becomes an exact science we may be able to determine beforehand just how many chances we may safely take. As it stands now, the orchardist feels that he can spend some money and a few anxious nights each spring in order to be more certain of securing a crop that frequently means from one hundred to one thousand dollars per acre.—E. R. Bennett, Colorado Agricultural College.

A drainage scheme is under way on farming lands near North Yakima, Washington, by which a large section of alkali land will be drained to make it tillable.

SAVE YOUR ALFALFA SEED

We continue to warn Farmers that 25 per cent. of their Alfalfa Seed is wasted when the ordinary grain separator is used for threshing.

IT IS VALUABLE

Alfalfa Seed is being imported into this country every year because the Western Farmer does not produce enough seed to supply the demand. With the prevailing high prices of seed you cannot afford to have your seed wasted in threshing. We build the only machine in the world constructed especially for hulling Alfalfa Seed. If your thresherman does not have a "Birdsell" Alfalfa Huller give us his name and address and we will send him our Catalog and you shall have our 1910 and 1911 calendar in colors.

OUR ALFALFA BOOKLET—FREE

This booklet contains 48 pages and was written by an Alfalfa Specialist. If you are not raising Alfalfa send for this book. He tells you how to start a crop, raise and harvest it. Every man should have this booklet. Write today.

Small Fruits and Vegetables

THE TOMATO AS A FOOD.

THE tomato, which is in general use as an article of food, is the fruit of a number of varieties of a plant known to scientists as the Lycopersicum Esculentum. Then there are also the varieties known as currants and cherry tomatoes. The fruit of the first of these grows in tiny clusters and the plant itself is small and only raised for ornamental purposes. Cherry tomatoes in size and appearance resemble the fruit from which they derive their name. They are occasionally grown for pickling and preserving purposes, but are rarities in the average kitchen.

The original home of the tomato was in Peru, the Brazils and other South American countries. Certain historical records still in existence show that Spanish adventurers visiting Peru took it from that country to Europe early in the sixteenth century. The nations on the northern shores of the Mediterranean seem to have favored it from the first. Britain and the Northern land, however, appear to have looked upon it with distrust and even dislike. Cultivation of the tomato for the market was not begun in Great Britain until 1800 and in America until 1830. Four varieties appear to have been grown, all of which were of the pink-fleshed type. They were popularly known as love apples or Jerusalem apples. The prejudices against them remained nevertheless and the belief that they would, if eaten, cause sickness and even death, seems to have been fixed in the minds of the multitude.

Botanists say that the old-time ideas about tomatoes being harmful probably arose from the fact that the plant belongs to the nightshade family. But outside of the poisonous qualities charged, a whole lot of silly superstitions have been saddled upon it by the weak and credulous. In America and in Britain as well, at the beginning of the last century, the tomato was declared to cause palsy, also colic in grow-ups and mumps in children. All this and other stupid notions concerning this beautiful and wholesome fruit have long since been exploded. Nevertheless one of such apparently remains, which is that the use of tomatoes causes cancer. As a single proof of the persistence of this evil ignorance may be cited the fact that within recent months a New York newspaper published a long article on tomatoes as a provocative of the dread disease in question.

An illustration of the absurdity of this mischievous belief is given by the Hon. W. Russell, the English medical authority and author, in his well-known work on "Diet and Its Relation to Disease." In the book he treats at length on cancer, gives statistics regarding it from localities all over the world, and appends a list of diets by which the disease may be prevented, checked or cured, and in the majority of these diets he gives a prominent place to tomatoes as a curative.

Tomatoes are universally recognized as an invalid food by medical men. This for the reason that their pulp and juice are not merely digestible, but contain an acid which is at once a mild aperient and a promoter of gastric secretions. Now cancer, according to Professor Russell and his colleagues, is a disease of impure blood, produced by an excessive use of meat, fish, alcohol or tea. These in turn interfere with the action of the assimilative and excretory organs, and the body becomes charged with poisonous matter, the outthrusting of which not infrequently takes the form of cancer. As the action of tomatoes on the body is of a purifying sort, for the reasons given, it follows that it must be anti-cancer instead of cancer-producing. Its beneficial ation on the stomach is recognized by the profession at large. The late Dr. Bull, of New York City, always used to order raw tomatoes for his patients when they reached the solid food stage of recovery, because of their blood purifying and intestinal regulating powers. At the general Memorial Hospital, New York City, better known as the Cancer Hospital, because the institution makes a specialty of treating cases of the disease, tomatoes in season constitute an important part of the diet of convalescent patients.

A semi-humorous eulogy of the tomato has been pronounced by Professor Charles Wickenham of Guy's Hospital, London, thus: "It makes superb soup either alone or with materials, it also makes ideal salads, catsups, pickles (green or ripe), sweet, spiced and sour, or in mangoes. The tomato is equally delectable if sliced, baked, escalloped, dried, fried or stewed. It is food for the sick and well, old and young; the rich and poor, the leisurely and the laboring, the wise and the otherwise, the saint and sinner. It is the best of all vegetables as an article of diet for the sick; especially if they suffer from stomach trouble, it is a gift from heaven."

Tomatoes are unquestionably more wholesome when eaten raw; they are one of the most popular articles for making salads. In fact, some are of the opinion that no salad is entirely complete without the tomato forming at least half of it. The green salad is one of the most healthful articles of diet, especially when eaten with a dressing similar to French dressing, simply using lemon juice as a substitute for vinegar. The best way to make this dressing is to squeeze and strain the juice of one lemon, then mix and dissolve salt to taste, after which add from two to four times as much olive oil as you have lemon juice and stir in thoroughly. Many prefer a small quantity of mustard with the dressing, and if this is desired, it can be added. Various combinations can be used with tomatoes to advantage; for instance, tomatoes and lettuce make a splendid salad; tomatoes and cabbage can also be recommended; tomatoes and watercress go well together; in fact, most any of the green vegetables ordinarily used for salads can be combined with tomatoes and the combination will in every instance have a splendid flavor. Many, however, prefer to use the tomato without the addition of other articles, and used in this manner it will make a splendid salad, especially when either mayonnaise or a dressing similar to the one just suggested is added.

The tomato might be termed an intestinal antiseptic; in other words, it has a cleansing effect upon the entire alimentary canal.—The Fruit Magazine.

For Work or Play

The backbone of our business is the manufacturing of Tents, Awnings, Irrigation Hose, and of heavy canvas construction in general. However, we serve the public in many ways: We supply you with hunting, fishing and camping goods, with outing apparel, storm clothing, sweaters, bathing suits, with flags, bicycles and kodaks.

Crop Conditions.

Crop conditions the country over are recorded by the Crop Reporting Board to be 5.5 per cent lower than on July 1, 1909, and 3.4 per cent lower than the ten-year average. We note that corn shows a general condition represented by 85.4 as compared with 85.3 last year and 85.1 for the ten-year average. Winter wheat is practically the same as last year and the ten-year average. The condition of barley is materially off, being 73.7 as against 90.2 last year and 88.1 ten-year average. All kinds of hays the country over show 80.2 as against 82.8 last year. Kaffir corn is 82.7 as against 89.4 last year. Grapes are 80.2 as against 90.2 last year or 88.5 ten-year average. Lemons and oranges are both reported shy, oranges showing 82.6 as against 88.6 ten-year average, and lemons 88.6 as against 91.4 ten-year average. Lima beans show 87.7 as against 89.1 last year. Hops look good, showing 89.6 as against 86.6 ten-year average. Sugar beets show 89.3 which is 1.3 better than the ten-year average. Cotton is also good, showing a condition this year of 80.7 as compared with 74.6 last year and 79.5 for the ten-year average.

According to Crop Reporting Board California has the greatest acreage of barley of any state in the Union. This acreage this year was 1,298,000 which, as compared with the acreage of last year, is 110 per cent. Minnesota, which is the second state this year, had 1,285,000 acres or four per cent less than her acreage last year. South Dakota comes third with 1,021,000 acres. Other states have smaller amounts, the total for the country being 7,057,000 acres.

Warming Outdoors.

We trust our readers who are not specially interested in frost protection will pardon us for the amount of space given over to that subject this week. These articles will have interest for many engaged in production of citrus fruits and also for some growers of deciduous fruits and grapes.

This matter of warming all outdoors has been discussed for many years and by some declared to be impracticable, but lemon growers who made a small fortune by giving a little attention to building fires in their orchards last December and January, are firmly convinced that their small investment brought immense gains, and they will continue preparing for the unwelcome Jack Frost.

It is yet several weeks before the citrus people will need to be ready for the fight and a still longer time before deciduous growers will need to think of preparation, but it is a feature of fruit growing which requires forethought. Those who are producing crops which may be affected by cold weather should not neglect to prepare.

The apple growers of Colorado have saved millions by preparedness. The apple growers of Washington and Oregon likewise are taking up the study of means and finding benefit from the work done. Vineyardists of California are also making profitable use of frost protection. These growers, however, have a different problem to face at a different time of the year from the citrus grower. Damage to deciduous crops is usually at blossoming time or very soon after, while the citrus grower must save his nearly matured fruit in December and January, but the same general principles prevail, and we trust this issue will be of interest to the deciduous as well as to the citrus orchardist.

Co-operate.

Fruit growers realize that one of the hardest features in fruit marketing is securing of cooperation on the part of their neighbors. Probably a still harder proposition will be to secure co-operation in fighting frost. Yet those who have observed efforts made toward frost protection assert it to be entirely successful, and to lessen expense frost fighting should be co-operative. The owner of one small tract of land may make an effort at protection and succeed in a very limited way in protecting his own orchard and others around it, but if all join the work is much simplified and made practically sure so far as frost conditions occurring in California are concerned. The one thing which prevents the preparation necessary for this frost protection is probably the gambling spirit born in most of us.

The cost of preparation for firing is not great, but at the same time if it is not necessary no fruit grower wishes to incur it. On the other hand where the saving amounts to dozens or perhaps hundreds of times the cost he should regard the "insurance" as cheap. If the weather does not demand use of materials on hand, there is little cost for distributing in the orchards. The supplies may be later stored until the next or succeeding years when they may be needed.

Breeders Magazine.

For six years the American Breeders Association has been discussing problems, the correct solution of which will lead to vastly improved conditions for the farming class of this country. "Practical breeders are beginning to understand that they need the work of scientists who study heredity and breeding; and the scientists have proven to themselves the wisdom of being in close touch with the breeders." The American Breeders Association has brought these classes together, and in the six annual meetings they have discussed these problems, and much material of value has been incorporated in their annual reports. The latest step of this organization is the publishing of a magazine. It is called the "American Breeders Magazine," and Volume 1 Number 1 is just received, though we note it bears date of "First Quarter, 1910." It aims to be the exponent of the newer and more scientific phases of the subject of breeding as applied to all plant and animal life. From its foreword written by James Wilson, we quote:

"Improvements by breeding are unlike those secured by adding new acres to the cultivated areas of the country, by deeper plowing, by more frequently cultivating the crop, by adding to the soil larger supplies of fertilizers, or by giving a more expensive ration to farm animals. These improvements, though they greatly increase the farmer's profits, are secured at a cost which sometimes equals the value of the added product. But the cost of improvements through breeding usually represents only a small fraction of the added values. The increase of product secured by breeding pays the cost in a short time, and, since there is no further expense, the annual increase afterward is clear profit. The farmer will be able to retain a part of the larger production in the form of added profit, and part will help to reduce the cost of living to those in our cities. Larger production on the farm will also give increased business for the transportation company, the manufacturer, and the merchant, and will provide the nation with a larger product with which to hold our balance of trade."

Frost Commission.

It may be noted in one of the articles on frost protection which appear in this week's issue, that a frost commission is suggested; this commission to be composed of representative citrus growers whose duties shall be to study questions of frost conditions and methods of work; still more to secure concerted action in the work against this menace to highest grade of fruit. It is generally conceded that the owner of the small orchard is up against an exceedingly hard proposition if he tries to warm up all outdoors by himself. The large orchardist or the orchardist in a community which will generally join in the work has a comparatively easy proposition, and a change of five or even ten degrees of temperature can be effected which will save his crop from any weather which has ever been given the citrus section. It is claimed that a ten degrees increase in temperature is easily secured over a large area. Therefore, the greatest problem which such a commission, if appointed, would have to meet, would be co-operative work in the orchards. Of course there are a thousand and one matters which would have to be considered, such as number of fires per acre, conditions of atmosphere, effects of air currents, best fuel, etc.

A Sucker a Minute.

A subscriber at Denair has sent us a number of circulars and pamphlets describing "lava fertilizers." The general price of the stuff is $20 per ton, though some grades range higher. The value is not stated, and we are unable to find any analysis given. But in any case, the effort does not seem to be so much to sell the product as to sell stock in the company. Unless fraud can be shown, that cannot, of course, be prevented, but when the sale of the "fertilizer" is taken up in this state, we imagine there will be something doing However, it probably never will be brought from New Jersey to California.

As to the purchasing of stock in such a concern, it does not seem as if the farmer would ever be caught, but the proverbial sucker a minute—and sometimes twins—affords ever new material for the promoters. We trust, however, that readers of the Cultivator will investigate carefully before investing.

Agricultural News Notes of the Pacific Coast

Northern California

Tehama county will ship about 200 cars of pears.

Penryn has shipped nearly fifty cars of standardized fruit.

Sacramento proposes to stop dredge mining on the American river.

Butte county finds it will have an exceptionally heavy peach crop.

Tehama county will vote on $175,000 bond issue for roads and bridges.

Many canneries bought apricots this season at $25 per ton orchard run.

Paradise Valley, Butte county, is planning for an apple fair to be held in November.

The first car of Gravensteins to be shipped from Sonoma county was from Healdsburg.

Warehouses at Arbuckle, Colusa county, are taxed to their fullest capacity with grain.

The board of supervisors of Siskiyou county allows a bounty of $2.50 on coyotes and $10.00 on panthers.

Some Thompson Seedless grapes near Yuba City have been injured by sunburning during the hot weather.

The Western Power Company will use 1000 carloads of cement in its concrete dam in the Feather river.

Meadow larks and doves have won many friends this year because of their inroads on the grasshopper pest.

The cannery at Yuba City, Sutter county, has arranged to handle 1600 tons of choice fruit. It will start this week.

Peach growers near Yuba City are selling to canners at $25 per ton, the canneries furnishing boxes and paying freight.

A large dairy company is negotiating for a lease of 1200 acres near Dixon, Solano county. It is proposed to install about 1000 cows.

Oiling of pools in Placer county to destroy malarial mosquitoes has resulted in killing some trout in streams into which the pools drain.

Warm weather has hastened the maturing of Yuba county's hop crop, and it is now estimated that picking will begin not far from August 12th.

The Sacramento Irrigation Company has filed on water in the upper Sacramento which it will use in irrigating the Antelope Valley, near Red Bluff.

The Anti-Debris Association is after various dredger companies near Oroville to prevent the depositing of debris in Honcut creek or the Feather river.

The Shasta County Poultry Keepers Association has been organized at Redding with C. W. Pawley of Millville, president, and S. C. Shadwell, Redding, secretary.

Orange growers of Butte county have requested the county supervisors to purchase a fumigating outfit for the horticultural commissioner for a campaign against yellow scale.

The state horticultural commission has served notice on the fruit growers of Placerville who have not joined in the standardizing movement, that infested fruit will not be allowed to leave the state.

Central California

The cannery at Turlock starts on peaches this week.

Hardwick, Kings county, claims to be some on producing corn.

San Benito county hay baling operations are practically finished.

The Grange at Turlock, Stanislaus county, is advertising for beans.

Canneries at Visalia, Tulare county, are in full operation on peaches.

The shortage of snow in the Sierra Nevada is giving scant water in the irrigating canals.

Fresno county is contemplating the bonding of the county for one million dollars for good roads.

The visit of the dairy inspector has caused a general cleaning of the dairy barns of Laton, Fresno county.

Porterville reports the output of oranges for the coming season to be from 60 to 75 per cent of normal.

The Visalia Agricultural Park Association is hustling its final arrangements for the fair to be held this fall.

Grasshoppers are still stripping trees and doing much damage in the neighborhood of Visalia, Tulare county.

The raisin advertising campaign conducted quite largely over the East has been successful in increasing the demand.

The directors of the Apple Carnival to be held in October at Watsonville are making an energetic campaign for a big show.

The first car of melons out of Turlock, Stanislaus county, was shipped July 6th, the growers receiving $12 to $15 per ton.

Turlock, Stanislaus county, reports great quantities of Russian thistle, and many are urging a concerted campaign against it.

A gardener has just purchased 200 acres of rich land near Porterville, Tulare county, and will go into gardening on a large scale.

The county live stock inspector of Kings county reports one case of glanders during the past month, no other contagious infectious diseases.

A company with a half a million capital has proposed to purchase 2300 acres of land near Corcoran, Kings county, and stock it with 1000 dairy cows.

The heirs of Chas. Lux have disposed of their interests in the great Miller & Lux estate, which owns much land in Central California, to Henry Miller.

There is much contention in the Modesto-Turlock Irrigation District over bonding the district for $1,000,000 for building reservoirs and enlarging the canals.

Suits between the Lakeside Ditch people in Kings county and the Tulare Irrigation Ditch Company, have been settled favorably to the interests of the irrigators.

The great sequoias in the Sierra Nevada in eastern Tulare and Fresno counties were threatened by forest fires last week, but an energetic fight on the part of a large force of men saved the field.

Southern California

Alligators are being discovered in the Salton Sea.

San Bernardino is working for an alfalfa meal mill.

Santa Maria is getting ready for a big farmers' institute August 3rd.

San Bernardino county hay balers report exceptionally good hay crop.

Redlands reports local apricot crop as 400 tons short of that of last year.

Oxnard sugar factory began its campaign on Ventura county beets on the 16th.

Orange county expects to produce about $600,000 worth of lima beans this season.

Almond growers of Antelope Valley have combined and purchased an almond huller.

Apricot driers at Orange report thieves carrying off their dried fruit in wholesale lots.

Imperial and Coachella Valleys have sent nearly 1600 cars of cantaloupes to the Eastern market.

The Farmers Union of Coachella Valley picknicked on the Fourth, entertaining all who came.

Colorado apple experts are looking into the apple possibilities of Yucaipe Valley, San Bernardino county.

The Warner Ranch in San Diego county reports feed better than usual and all stock in excellent condition.

Corona, Riverside county, reports its output of honey for this year will be less than one-fourth the normal crop.

Imperial Valley has secured the aid of nearly fifty young women expert table grape packers from Fresno for the season's run.

The sugar factories at Santa Ana and Los Alamitos are starting on the beets which will bring the farmers this year $1,250,000.

The work of constructing eight new cotton gins has been taken up in the Imperial Valley. They will be ready for operation by October 1st.

The apricot season is ended and a few lots of fruit have been sold, but most driers have refused offers which have been made up to this time.

A. V. Steubenrauch who succeeded G. Harold Powell in the orange and lemon decay investigations, will visit California and address citrus growers.

Orange county's bean crop prospects are not as bright as early in the season, and it is now estimated that the output will be 25 per cent short of last season.

The apricot pitting record is now claimed by a girl who worked in the dry-yard at El Modena, Orange county. Between 7 a.m. and 6 p.m. she pitted 1090 pounds and laid fruit neatly on trays.

The annual convention of the American Institute of Homeopathy which was held in Pasadena this year, passed a resolution touching upon the sulphuring of fruits "in favor of the farmer, fruit grower and preserving factories, and against the pernicious rulings of Dr. H. W. Wiley, Chief of the United States Bureau of Chemistry."

The Coast

Prineville, Oregon, began cutting its grain hay at the end of June.

Ritzville, Wash., reports great damage to all grain crops by the drouth.

Harvesting of wheat now on in western Montana shows lighter crops than anticipated.

The forest fire near Vancouver, B. C., covered many square miles and destroyed valuable forests.

Columbia county, Washington, has done more of its harvesting this year by combined harvesters than ever before.

More than 200,000 acres of land are now receiving supplies of water from the Roosevelt dam in Arizona.

Farmers in Northern Idaho report an increase of five bushels of grain per acre under the dry farming process.

The first hogs of the season were recently shipped from Nez Perce, Idaho, and brought to the farmer 9¼ cents.

A pear grower near North Yakima, Washington, has sold his crop on twelve acres for $5500, buyer to take all risks.

Farmers near Prineville, Oregon, mow one crop of grain hay and sow immediately another crop on same ground.

The Interstate Fair to be held at Spokane this fall will have, it is predicted, a great display of apples and other fruits.

Owing to lack of spring rains it is feared the grain output of the Inland Empire will fall 30 per cent short of that of last year.

The state grain inspector of Washington reports that the drouth has done great injury but not by any means destroyed the grain crop.

The Yuma Valley, Arizona, will harvest about 15,000 acres of alfalfa seed this year. The crop will prove very satisfactory in that section.

Peach orchards near Nelson, British Columbia, will show the heaviest crop ever this year. Nelson will ship 100 cars of plums and 300 cars of apples to prairie points farther east.

The Tempe Irrigation Canal Company will be incorporated within the Salt River Irrigation Project in Arizona, and a canal constructed which will cover 24,000 acres of land.

The largest wool producer in the United States is C. M. Blair of Billings, Montana. His clip this year amounted to a million and a half pounds which he has just sold to a Boston purchaser.

A variation of the demonstration train idea is being tried from Sprague, Wash., where a demonstration boat tour is made of points about Puget Sound. The boat will start July 20th and continue its journey till August 5th.

Farmers in Saskatchewan, Western Canada, are planning for a series of alfalfa experiments, and a $1000 prize is to be awarded for the best ten acre field which can be shown in 1914. The seed in the competing fields must be sown not later than the season of 1912. Artificially irrigated crops are not eligible.

Coulson's

EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying power and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Get it at your dealer's; anyway send for our Catalog which tells about the familiar Coulson Products and gives valuable information about Poultry Raising.

Coulson Poultry & Stock Food Co., Petaluma

Germain Seed & Plant Co.,
Distributing Agents for S. California

The Mandy Lee Incubator

Why Is It Better?

Both ends are metal, no warm pipes touch wood at any point, but are carried through metal and asbestos. It is fireproof.

There are no hot pipes over the eggs giving some of them too much heat and toughening the yolk of the egg, thus causing the chick to die with bowel trouble. Every egg gets the same heat, so that all have an equal chance to hatch.

With our improved moisture pan and hygrometer the moisture may be kept absolutely correct, which will rot the shell and ripen the membrane. With our new system of ventilation, which is on the level just as the best hen ventilates her nest, with no up or down movement of air,

Every Egg Gets Fresh Oxygen All the Time

and not just for a few minutes while the eggs are being turned. With the right heat, right moisture, and right ventilation, you furnish the right kind of eggs and what may you expect? Just what we tell you, more chicks ready to grow and thrive than you have ever turned out, not counting an exceptional case, but **all the time.**

Lee's goods are all of the same character, always the same and always the best.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

ROUP.

THIS disease is the bane of the chicken growers in every state in the Union. It is no more prevalent in California than it is in other states, but we have it here in places where the wind sweeps through the hills, and wherever chickens are kept in crowded coops.

As the chicks grow, they require more room at night, and very often outgrow their roosting places before we realize how fast they are sizing up. Then is when the trouble begins. Crowded and hot at night, sometimes perspiring and panting for breath, they weaken, and when we let them out in the fresh morning air they fairly stagger and quickly huddle to get warm again. Then they take cold, their eyes begin to froth, nostrils to discharge, and unless promptly treated, run into a roupy condition which unfits them for further service. The oldest treatment we have any record of, is what is called the kerosene treatment and if used at the first, sometimes works wonders. Pour a teacupful of kerosene oil on a pail of water where it forms a coating, as it floats and does not mix. Then take the birds affected, one by one, and with a forked stick, hold their heads under while you slowly count three. This forces the fluid through the head and into the throat. Lift them out and wipe dry, and sometimes this will be all the treatment necessary. It is well, however, to put a teaspoon or two of the oil on the drinking water for a few days, as this obliges them to take a small dose every time they take a drink.

This treatment is recommended by Dr. N. W. Sanborn, who says he has known it to cure bad cases which were afterwards sold to the butcher in good condition. This happy (?) termination does not always reward the efforts of the amateur physician, so the following symptoms now develop. The roupy bird goes off by itself, is dull and listless, moping around as though longing for death, with its aching head hid under its forlorn little wings just as we feel when laboring with a hard cold ourselves. Soon the eyes become stuck shut with the sticky discharge, and the bird almost starves to death from just being unable to see to eat. Again it eats voraciously, fouling the food and water and spreading contagion to the rest of the flock, if not isolated. Sometimes there is just fever, and usually the head is the most feverish. In this case the eyes are apt to swell, or, rather, the membranes near the eyes, for the eyes themselves are seldom affected unless the swelling becomes so large as to destroy them entirely, because there is not room enough for both eyes and tumor. This must be a terribly painful affliction, and the more merciful way is to use the hatchet on such a fowl, rather than attempt to cure it at a greater expense of time and trouble than it is worth. Bear always in mind the fact that a bird which has had roup in such severe form is unfitted for a breeder, and then count carefully the cost of medicine, time and feed, until it gets into laying or marketing condition, and nine times out of ten the cheaper cure is the oft quoted hatchet.

Sometimes the disease seems arrested, and the symptoms abate, but the fowl gets thinner and thinner, although it may eat well. A diarrhoea sets in, and it lies around and dies in a few days after this occurs. Roup is highly infectious, therefore all birds even slightly affected should be carefully kept by themselves and the dishes used for them, well scalded and cleaned before using for other flocks.

Roup may also run into a diphtheritic stage, and form canker and false membranes which fill the head and throat until the bird chokes to death. This form is sometimes cured by painstaking methods, but "what's the use?" Only a highly prized show bird is worth such efforts, and should not be shown in company with healthy birds even then, but unscrupulous people not only sometimes do this, but sell them for long prices as well.

Again, like a cold in the human being, the disease may run into consumption, in which case the bird mopes around for months, eating well, but never laying an egg, growing gradually thinner and thinner until it dies from exhaustion, apparently. Take it "for and by" as the old folks say, it pays better to prevent than to cure the dreaded roup, and prevention means catering to the fowls' comfort and providing sanitary surroundings and pure and plentiful food.—Mrs. Frank Metcalf.

BULLETINS ON POULTRY.

The following list of Bulletins issued by the Department makes a valuable addition to the poultryman's library and may be had for the asking of the congressman representing the district of any one wishing them or possibly by writing direct to Secretary Wilson. The list is compiled by the Colorado Agricultural College.

Breeds.

Standard varieties of chickens. Farmers' Bul. No. 51.

Death.

Causes of death in young chicks. Farmers' Bul. No. 309.

Disease.

Gape disease of chickens. Farmers' Bul. No. 84.

Dressing.

Dressing and packing poultry for shipment. Farmers' Bul. No. 144.

Ducks.

Ducks and geese of standard breeds. Farmers' Bul. No. 64. Recent experiments in feeding ducks. Farmers' Bul. No. 107.

Eggs.

Fertility of eggs. Farmers' Bul. No. 251. Food value of hens' eggs. Farmers' Bul. No. 97. Nest box for keeping individual egg records. Farmers' Bul. No. 114. Preserving eggs. Farmers' Bul. No. 296. Relation of feed to the flavor of eggs. Farmers' Bul. No. 122. Selling eggs by weight. Farmers' Bul. No. 122.

Feeding.

Animal matter a necessity for poultry. Farmers' Bul. No. 97. Condimental and medicinal cattle and po try foods. Farmers' Bul. No. 144. Dry feeding and self-feeders for poultry. Farmers' Bul. No. 244. Grit and mineral matter for chicks. Farmers' Bul. No. 225. Ground grain vs. whole grain for chickens. Farmers' Bul. No. 84. Skim milk for young chickens. Farmers' Bul. No. 84. Substituting snow for water for poultry. Farmers' Bul. No. 309.

Food.

Digestibility of fish and poultry. Farmers' Bul. No. 276. Poultry as food. Farmers' Bul. No. 182.

Geese.

Raising geese for profit. Farmers' Bul. No. 65. Ducks and Geese, standard breeds. Farmers' Bul. No. 64.

Guinea Fowl.

Guinea fowl and its use as food. Farmers' Bul. No. 234.

Housing.

Construction and Ventilation of poultry houses. Farmers' Bul. No. 227. Successful brooder house, Farmer's Bul. No. 225.

Incubators.

Evaporation of eggs and other factors which affect incubation. Farmers' Bul. No. 309. Natural and artificial incubation of chicks. Farmers' Bul. No. 281.

Laying Hens.

Number of laying hens that may be profitably kept in one pen. Farmers' Bul. No. 114. Rations for laying hens. Farmers' Bul. No. 186.

Management.

Healthy poultry. Farmers' Bul. No. 305. Poultry management. Farmers' Bul. No. 287. Suggestions for amateur poultry raisers. Farmers' Bul. No. 237.

Manure.

Preservation and value of hen manure. Farmers' Bul. No. 210.

Moulting.

Producing early moulting in hens. Farmers' Bul. No. 186.

Squab.

Squab raising. Farmers' Bul. No. 177.

Turkeys.

Recent experiments with turkeys. Farmers' Bul. No. 225. Turkeys, standard varieties and management. Farmers' Bul. No. 200.

WHEN FORCING EGGS.

If your flock is large enough separate the layers from the breeders and mildly force for eggs while eggs are high. This forcing can be done in several ways. A little cut green bone, an extra touch of blood meal in a spiced mash fed in the morning, warm mashes nicely spiced with a dish of pepper added. Add charcoal to all mashes throughout the winter. Cracklings may be also fed, either in mash or separately. Lots of succulent green food in addition to some good cut clover or alfalfa hay. Sprouted oats during the winter will also help the egg yield. Soaked oats mixed with a little bran or shorts and fed warm is another good food. The food question must be studied right on the spot, according to climate, style of house, etc.

No rooster is needed for these layers. Eggs come as freely without as with the male bird's attentions. Another thing, do not be afraid of getting the pullets too fat for egg work. Pullets are oftener underfed than overfed during the winter months. In all our experience we have never been able to make a pullet too fat to lay during her first winter's egg work. Some winters all grain and meals have been hopper fed. The grain has been where they could obtain all they needed without any trouble. Other winters we have tried feeding all grain in the litter with only the mash before them. No material difference was noticed in the egg yield in either case. The main thing about winter egg work is to have some choice pullets, vigorous and strong. Have them mature about October when the cold weather is just beginning. Once in full lay they will never stop until moulting time the following fall.—Green's Fruit Grower.

The comb is not only an ornamental appendage to a fowl—it is also an index to health. The color of the comb indicates the condition of the fowl. If the comb is pale, covered with spots, or dark purplish in color, it is quite certain that the fowl is out of condition. A well conditioned fowl shows a bright red comb. Fowls with very large combs are nearly always good layers and in vigorous health. We would not buy a male bird with a small, pinched comb but would choose one having a comb broad at the base, well set and of a size characteristic of the breed.

Poultrymen should remember that hens should always be kept busy searching for food, so that they may get sufficient exercise. The fowls should be sent to roost at night with full crops, and gotten off the roost in the morning to scratch in straw or leaves for grain during the day.

Charcoal is a good health producer. Give it to the fowls freely. Often it will correct minor ailments, such as slight bowel trouble or indigestion.

Take the roosters out of the laying pens, unless the eggs are to be used for hatching. Their room is better than their company.

Skimmed milk has been proved a valuable food for laying hens, according to experiments at the Virginia experiment station.

FIGHTING FROST WITH FIRE.

The Tennessee Experiment Station reports experiments in the use of fires as frost protectors as follows:

Throughout Tennessee, and the country generally, the peach crop is endangered by spring frosts, the greatest single cause of failure probably, in the peach industry. In the spring of 1908 and 1909 coal fires were lighted in the experiment orchard, and on the nights of March 15 and 16, 1910, wood fires were burned. In 1908 baskets were made of galvanized wire netting (chicken fencing), one-inch mesh. They were about 10x16 inches in size, and were set with their short edges resting on two bricks, thus affording draft. Coal fires were kept going in them, but required frequent attention. In most cases they were burned out in three firings, thus proving inadequate. The fires were placed 36x40 feet apart, in alternate spaces throughout the orchard. Two and a half tons of coal were used in keeping fires eight hours per night for three nights in two acres of orchard. The temperature within the orchard and beyond its borders was read by standard thermometers hourly, the least difference being four degrees increased heat as the result of the fires, while on one night six degrees increased heat resulted. On March 15 and 16, 1910, wood fires were used, the same distance as noted above. Stumps removed in clearing land in the previous year were burned, and made better fuel than coal, the fires requiring less frequent attention. The minimum temperature outside the orchard was 21 degrees, and within the range of the heat from the fires the minimum was 27 degrees. Fortunately the weather was dry, and few of the buds were advanced enough to show the color of the petals. Some bloom was destroyed, but enough remains uninjured to insure a crop if no further frost injury comes.

Don't let your fowls get all run down during hot weather and molting time, but keep them in good condition.

Egg-More Booklet

tells you how. It is free. Send for it. Send us addresses of 5 persons in your vicinity who have fowls, and we will send you postpaid, an Anchor Egg Separator. For 20 addresses, we will also send The Poultry Manual, a book well worth 50 cents.

How Much Is Water Worth?

Water is very expensive if you are buying a disinfectant that is half water.

Coulson's CRESOLENE

is a powerful disinfectant and germicide made from coal tar. You add the water yourself to make the disinfectant desired strength. COULSON'S CRESOLENE must be diluted from 20 to 100 times its own bulk. It is not poisonous—more powerful than copperas, cloride of lime and other well-known disinfectants. It forms a milky emulsion that only costs 1 1-4 cents a gallon. It is the cheapest disinfectant on the market and at the same time the best. Use it on stock—poultry—dogs or as a general disinfectant and insecticide.

If your dealer does not keep it, order direct from us. Quart cans—50c. Gallon cans—$1.25. Freight free on gallon orders.

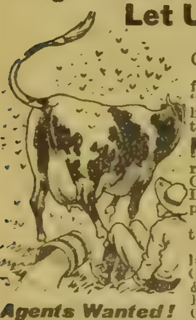
Try Conkey's Fly Knocker 15 Days Free!

Let Us Send You a Gallon Can, Express Prepaid



Horses lose flesh and shirk work when bothered and bitten by flies. Cows give less milk when tortured and frenzied by these pests.

In the name of humanity and for the sake of your pocketbook, keep your stock free from torturing, maddening, disease-breeding swarms of flies this summer! "Fly Knocker" solves the problem. It relieves the distress of your stock and helps rid your barn of the fly nuisance. Conkey's Fly Knocker is the greatest boon to fly-tortured animals that the world has ever known.

NO DEPOSIT REQUIRED! Send today for a gallon can on Free Trial. At the end of 15 days, if you are delighted with the results, send us $1.25, which includes express to any point in California, Western Oregon and Western Washington. If located east of Seattle or Portland, or in Idaho, Montana, Utah, New Mexico or Nevada, send $1.50. If, however, it fails to please you, you don't owe us a cent.

If your local dealer handles Conkey's Fly Knocker, cut out ad and give to him, thus saving express. If not, send order to our nearest distributor, as follows:

Germain Seed Co., Los Angeles, Cal.; Coulson Poultry & Stock Food Co., Petaluma, Cal.; Routledge Seed Co., Portland, Ore., Seattle Seed Co., Seattle, Wash.; Church Seed Co., Spokane, Wash.; Great Falls Drug Co., Great Falls, Mont.; Smith & Co., Boise, Idaho, Vogeler Seed Co., Salt Lake City, Utah: Hill's Seed Store, Phoenix, Ariz.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

THE OX WARBLE.

THE ox warble is the larval or worm stage of a fly known by various names, such as the eel fly, striped hypoderma, grub or warble fly, etc.

This fly is found most abundant in the southern states, while in the extreme, northern states very few or none are found. This fly has four stages; the egg, or ova, the larval, or worm, the cocoon, or pupal, and the adult, or fly. It was thought by early writers that the fly laid the eggs in the skin of the backs of cattle. This idea has long ago been proved to be wrong by Dr. Cooper Curtice. The writer has been able to confirm Doctor Curtice's story of the history of the various stages of this parasite, which is as follows: The fly lays the eggs, cementing them to the hair in the region of the heel of cattle, where, perhaps the crawling of the minute larvae, or worms, over the skin causes the animal to lick the part and thus gets the larvae into the mouth. They now become lodged in the mucous membrane (lining) of the oesophagus and here pass a part of their worm stage. The part in which they are imbedded is not inflamed and no serious injury is produced at this point. The worm at this stage can be found in this locality during the summer months. At this point they never reach a size greater than about a half inch in length and three-sixteenths in diameter. After passing this part of their life, they leave the oesophagus and find their way between the muscles, through the loose connective tissue, and become lodged under the skin in the region of the withers and down the spinal column. The question has often been asked: "Why do they lodge here?" I will answer that by asking: "Why a lung worm upon being swallowed and reaching the stomach finds its way to the lungs and will not develop in any other part of the body?" These tumors in the region of the back grow as the worm grows. At the summit of each tumor will be found a hole, which also grows as the tumor enlarges. In April and May (depending upon the latitude) they are fully developed and leave the tumor. This they are enabled to do from the fact that they are soft and contractile. It has been observed that most of them leave the tumors in the morning. They now burrow into the ground and form around them a cocoon in which they pass through the stage which brings them to the adult, or fly stage again. The length of time they are parasites in the animal is about ten months. The length of time in the ground, from four to six weeks, and the length of the life of the fly from two to four weeks, making the entire life history about twelve months.

The warble in the back does not cause a great deal of injury to the host. Some irritation is at times manifested. The warble can be easily squeezed out by gentle pressure at the base of the tumor. The injury to the hide industry (in those cattle slaughtered that are "grubby") is considerable. Everywhere there is a tumor there is a hole, and when the hide is tanned, a larger hole results.—B. F. Kaupp, Colorado Agricultural College.

LOSSES IN MANURE.

One of our experiment stations has shown by careful investigation that when the stable manure is piled up and left exposed to the rains the loss from leaching of the fertile elements is very large. The New Jersey station finds that manure exposed for 100 days lost over one-half of the nitrogen, one-half of the phosphoric acid, and the same proportion of the potassium had been lost. More than one-half of the constituents had been lost by an exposure of less than four pounds. Work from other experiment stations confirms this.

A great deal of valuable manure is also lost in badly arranged stables, where there are poor facilities for recovering the manure. The valuable liquid manure is lost by drainage.

The best way to save all the fertile elements in manure is to haul it on the fields and meadows and spread it evenly over the land. Washed into the soil it is preserved for the next crop.

OLEO, RENOVATED BUTTER, ETC.

Answering a query as to oleo, butterine, renovated butter, etc., the Rural New Yorker says:

"Oleomargarine and butterine are mixtures of various fats, such as lard, beef fat, cotton-seed oil and a small quantity of butter. These fats are mixed or blended by various processes. "Renovated butter" is usually butter that has gone bad or rancid, melted and treated to drive off the bad smells, and then cooled and handled so as to look as much as possible like fresh butter. There is not supposed to be anything in "renovated" butter except butter fat. It is usually made from stuff that could not be sold without being treated."

The harvesting season is beginning in the Walla Walla grain fields.

HINTS ON BUTTER MAKING.

Making good butter is the most important matter concerning the creamery managers and dairymen of the San Joaquin Valley and other parts of California, but more particularly in the Valley, because our climate in the warm summer months is not so favorable, as that of the coast counties.

The quality of butter made at the creamery and the price received therefrom depends to a great extent on the care taken of the cream by the dairyman.

A few simple rules for producing good cream are as follows:

First—The surroundings and general conditions of the dairy must be sanitary.

Second—The tinware and separator must be washed thoroughly and well aired each time after using.

A Cleft in the Desert Hills.
Here and there the sunburned ridges show the very skeleton of the earth.

Third—On going to milk in the evening cold well water should be pumped—enough to fill one can—this cools the can and when the first pail of milk is ready to be strained, pour the water into another can and strain the milk into the cool one. The cans should be placed in the shade and wet sacks put around them if possible, When ready to separate the milk, pump more cold water into the can which is to receive the cream. By the separator have a half barrel or a tub with a rack fixed to hold the cream cans straight. Partially fill this tub with cold water and as the cream fills the can it will settle down into the water; then have a small pulley at the top of a pole or on a tree; put a stout cord through this pulley, with two hooks on the end of the rope—these hooks fasten in the handles of the cream can. Put two well-soaked sacks around the can and haul it up to the pulley, thus raising it away from the heat of the earth to an elevation where the air is circulating freely, causing a rapid evaporation. The water evaporating carries away the units of heat from the cream, leaving it in good condition. In thé morning the can of cream should be lowered and placed in a sack cooler, which everybody should have. When the morning's cream is separated then a wet sack should be put around each can and it should be taken at once to the creamery.

Cream handled in this way will produce the best butter, for which the best price can be obtained, and the dairyman is well paid for the little extra pains taken with his cream. Besides this the . sample taken out at the creamery for testing will be smoother and in such a condition that the testor can make a correct test. A large amount of the cream sent to the creameries is of too low a test in butter fat. No cream should be sent to the creamery in summer time that will not test 35 per cent. At this per cent of butter fat the sample for testing will not be full of hard particles of curd, made so by cream being sour. The preservative tablet used will keep sweet cream from getting sour in the sample bottle, but will not make a sour sample sweet. A great deal of the trouble the creamery has with the patron is on account of the patron skimming his cream too thin. This thin cream sours quickly in warm weather. The sample from this cream divides into whey, curd and fat in the bottle and it is almost impossible to emulsify the contents so as to get a perfect test.

There are many other important reasons why a dairyman should skim his cream to test at least 35 per cent butter fat and follow these rules for care of the cream. He is the only one to reap the benefits, especially if he is a patron of a co-operative creamery.—J. P. Murphy, Manager, Tulare Co-Op. Creamery Assn.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.

TRAINING THE COLLIE.

Whether whipping will spoil the Collie depends altogether upon the disposition of the individual dog. If he is somewhat timid he should never be touched with the whip; but if head-strong, a touch with the whip will often do a world of good. The older a dog gets the more grit he will have. There is just as much difference in the disposition of dogs as in human beings. Some children will learn to talk and walk a great deal sooner than others, and some dogs will work with cattle when six months old, while others will not until they are one or two years old. Often the latter make the better dogs. As a rule they are slow drivers and can be kept under control better than the fast drivers. The trouble with many folks is they think all that is necessary is to send for a pup, pay a good price, and it will grow up and become a fine trained dog, without any help from its owner. This is a great mistake. Another great trouble is that the children are permitted to play with the dog altogether too much. Sometimes they hitch them up and undertake to drive them. Other times they whip them or scold them. The owner may know nothing about this, and when he undertakes to train the dog the latter will run away and act as if he was afraid. Then the owner loses patience and is likely to abuse the dog, thus making a bad matter worse. No man who loses his temper can train a Collie dog.

A dog should never work with cattle until he is at least a year old. If he is anxious for work, use him on sheep or pigs, and he is not so likely to be hurt by them. The main thing in training a Collie is to make him understand what you want him to do. Speak gently in plain words, using as few words as possible, and always using the same words for the same thing, and at the time of using the words make a gesture with the hand. Encourage the dog freely and be slow to scold. Praise him even when he has not done exactly what you want him to do or in exactly the way you would like to have him do it. Repeat the same lessons day after day until the dog understands what you mean by the words and gestures used. Don't talk to him in a gruff voice, and do not misuse him in any way.

There are days when your dog will not feel like working well. You have the same experience. Have some consideration for him at these times, and do not under any circumstances lose your temper. When the dog finally learns the lesson you have been trying to teach him be lavish with your praise.—Iowa Dog Trainer in Wallace's Farmer.

THEY SWELL IN THE MIDDLE.

A Cultivator representative working in Kings county is picking up a great fund of information as to value of various stock feeds, and, incidentally, poetry. While in Hanford recently he ran across one of the contributing staff of the Cultivator, Mr. N. C. Blanchard, and secured from him the following classic:

And now that same stockman named
Biddle,
Helps out with the raisin crop riddle;
Instead of the figs
He feeds raisins to pigs,
And smiles as they swell in the middle.

One raisin grower of Kings county recently secured a large lot of raisins damaged by packing house fire and used them in the manufacture of pork. This was the inspiration of the limerick.

The condition of the weather will govern the length of time it will be necessary to keep a newly farrowed sow in close quarters, but she should not be denied access to the open air. Pigs should not be allowed out in a cold rain or where they will receive the shock of cold winds. Where they can do so witout danger they should be put in the sun within 24 hours after birth, and after that the best practice is to let them run in and out at will. Neither the sow nor very young pigs should be permitted to run in pasture early in the morning if the grass is tall and wet with rain or heavy dew.—From Coburn's Swine in America.

Warranted
to give satisfaction.

GOMBAULT'S
CAUSTIC BALSAM

A safe. speedy and
positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a **HUMAN REMEDY** for **Rheumatism, Sprains, Sore Throat, etc.,** it is invaluable.

Every bottle of **Caustic Balsam** sold is Warranted to give satisfaction Price **$1.50** per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

THE LAWRENCE-WILLIAMS COMPANY, Cleveland, Ohio.

Live Oaks Farm
Frank A. Meacham, Proprietor.
Importer and breeder of RED POLLED CATTLE, SHROPSHIRE SHEEP, RAMBOUILLET SHEEP, HORNLESS AMERICAN MERINO SHEEP., Both sexes for sale. Take electric car at Petaluma or Santa Rosa for LIVE OAKS STATION. Address all mail to
Petaluma, Sonoma Co., Cal.

St. Lambert and Flying Fox Blood. Margery Golden's Fox heads the Herd. Young stock for sale. **GUY H. MILLER, Prop., R. 3, Modesto, Cal.**

Money Making Little Liners

In this department we will insert your advertisement under a classified head for 1½ cents per word. No ad accepted for less than 25c. Our classified columns are the clearing house for our many thousand readers.

MACHINERY.

FOR SALE—SECOND HAND
WINDMILLS, TANKS,
PUMPS, ENGINES,
FARM MACHINERY,
that will do the same work as new at half the price. Domestic and irrigating windmills and tanks; all sizes. Tanks from 50 gallons up to 50,000. Engines—three 2 H. P. Fairbanks; 3 H. P. Dempster, 6 H. P. Fairbanks, 6 H. P. White & Middleton. 9 H. P. Moore, 10 H. P. Lambert, 18 H. P. Western, 25 H. P. self-contained engine and mining hoist, brand new 2 and 4 H. P. steam engine and boilers. Farm wagons, threshing machine, baler, header, Fosmer gang plow and Venicia disc gang breaking plow, road plow, sacker, hay truck, wagon tanks, slip and Fresno scrapers, wood sawing outfit mounted, splitter, weeder, fruit crusher, bone grinder. Most anything a rancher wants, second hand. DEMMITT CO., upstairs 120 N. Main, Los Angeles.

FOR SALE—GASOLINE ENGINES, several sizes, standard makes, taken in exchange for new ones. Have been thoroughly overhauled, will guarantee like new. Also pumps, motors, air compressors, etc. We have what you need, either new or second hand, and save you money. BAILIE & BRANDT COMPANY, 943-945 No. Main St., Los Angeles, Cal.

TREES.

FINE LARGE EUREKA LEMON AND Valencia Orange trees, fine for replanting. Choice lot of fine Wash. Navels. Order quickly. They are going. Home 'phone 1731. JOHN R. KING, Whittier, Cal.

MARSH SEEDLESS GRAPEFRUIT—600 large trees for sale. E. S. THACHER, Nordhoff, Cal.

MR. NURSERYMAN—WHAT DO YOU need? What is your overstock? BALLOU'S NURSERY, Pasadena, Cal.

LATE VALENCIA ORANGE TREES for sale for May and June delivery. ADOLPH RIMPAU, Anaheim, Cal.

FOR FIRST CLASS VALENCIA AND Navel orange trees and Eureka lemons see A. G. SNOW, Oxnard, Cal.

WANTED.

WANTED—YOUR WORK PAYS THE expense to learn a trade that pays $5 a day, in a few months' time; electricity, automobiles, plumbing, bricklaying; actual contract jobs; 200 students last year. UNITED TRADE SCHOOL CONTRACTING COMPANY, 647 Pacific Electric Bldg., Los Angeles, Cal.

FARMS WANTED—WE CAN TURN A quick sale for you, as we are in close touch with buyers everywhere. Let us show you how to save agents' commissions. Or if you want to buy property of any kind, anywhere, write us. AMERICAN INVESTMENT ASSOCIATION, Minneapolis, Minn.

EDUCATED GERMAN, PRACTICAL dairyman and rancher, wishes position as superintendent on large dairy ranch. Send letters under name of A. BADER, General Delivery, Pasadena, Cal.

WANTED—HAVE DEMAND AND OPportunity for sale and exchange of suburban, beach ,and farm properties. PARRISH BARKER, 207 Union Trust Bldg., Los Angeles. Phone A 3272.

HORTICULTURAL PRINTING.

THE KRUCKENBERG PRESS, 123 South Los Angeles St., Los Angeles, Cal., makes a specialty of Horticultural Printing and Engraving. Cuts and illustrations of all standard, economic and ornamental plants on hand and subject to the use of patrons without cost. Samples and estimates cheerfully furnished. Remember, we design, write, engrave, bind and print; in brief, do the "whole thing," at no additional expense to the customer. Correspondence a pleasure; a personal visit a joy. Headquarters for catalogues and quadri-color printing.

RABBITS.

FOR SALE—EUREKA RABBIT WARren Co., 928 Valverde St., Los Angeles, Cal., Wright and King, props. 150 fine bred New Zealand hares and 200 fine bred Belgian brood does and stud bucks from $1.00 up. Your correspondence is solicited.

BELGIAN HARES, CHOICE STOCK, Two months old, 50c; four months, $1.00; five months, $2.00; mature, $2.50. J. K. PIERCE, R. 2, Box 15, Petaluma, Cal.

RARE PLANTS.

FINEST THINGS FOR LAWNS. Feathery, not running, Bamboos; Arundinaria falcata, and Arundinaria Falconeri. For sale by the MONTARIOSO NURSERY, Box 1500, Santa Barbara, Cal.

WILD PLANT IMPROVEMENT GARdens, Santa Ana, California. NEWTON B. PIERCE, Proprietor. Rare choice ornamentals and new fruits from all lands.

POULTRY.

HOW TO MAKE MONEY—MRS. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1.00. Address Mrs. A. Basley, Box 77, Venice, Cal. Send postal.

CHICKS! CHICKS! CHICKS! CHICKS!
2500 Per Week.
Barred Rocks, Rhode Island Reds, White Rocks, Brown and White Leghorns. We ship safely everywhere within 48 hours. Send today for free 32-page book. Tells all about the chicks we offer and gives prices on laying hens, pullets, cocks, etc. PIONEER HATCHERY CO., 112 East 8th St., Los Angeles.

FOR SALE, AT A BARGAIN, AT 956 E. 33rd street, about 60 White Wyandotte hens and about 250 head of young stock, ranging from two weeks to four months, all from prize stock. Together with incubators, brooders, Philo houses, and everything complete for a start in the chicken business. By a party who has made a success of it, but is forced to sell on account of business in the East which will require his constant attention.

150 RHODE ISLAND RED HENS, yearlings and two-year-olds, have been left with me to sell. 50 at $1.00 each, 50 at $1.25, 50 at $1.50. To the purchaser of the entire lot a discount of 10 per cent will be made. CHAS. E. WINSLOW, Monrovia, Cal. Box 368, phone 181.

POULTRY WANTED—WE PAY THE highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. ALLAWAY & LAYTON CO., 607 E. 3rd St., Los Angeles, Cal.

CHOICE S. C. WHITE MINORCA PULlets, two months old, 75c; two months cockerels, 75c; three months, $1.00; between four and five months, $1.50. Twelve hens, $1.50 each, cock $2.00, good breeding stock. A. H. BURLINGAME, Westminster, Cal.

FOR SALE—EIGHT HENS AND COCK, Rose Comb Black Minorcas (Northrup strain). Seven hens and cock, White Minorcas. All pure bred, fine stock. Also pullets and cockerels, and Rhode Island Reds. C. U. CHAMBERLIN, Gem City Yards, Los Gatos, Cal.,

FOR SALE—PURE BRED BARRED Plymouth Rock chickens. Crane and McClanahan strains. March hatch. $10.00 a dozen, $1.00 each. Mated pens. MINNEWAWA VINEYARD, Fresno, Cal.

LOVELL'S BLACK MINORCAS
California's
greatest egg producers
Pedigreed, trapnested, scientifically bred. Free circular. DAVID J. LOVELL, 5720 So. Park Ave., Los Angeles, Cal.

BONNELL'S S. C. BLACK MINORCAS win every time, the best that can be secured at any price. Eggs reduced to $1.50 per setting. A few cockerels for sale. C. C. BONNELL, State Vice President American Black Minorca Club, 2919 Brighton Ave., Los Angeles.

WHITE INDIAN RUNNER DUCKS. Some fine breeding stock for sale. Also eggs from Howard's strain White Leghorns. J. C. CARLYLE, R. F. D. 4, Box 249, Los Angeles. Successor to Mrs. Grey. Phone Sunset South 6342.

LODI HATCHERY—JUST HATCHED, chicks from healthy, heavy laying stock. Booking orders for later delivery. T. C. HAWLEY, 504 E. Elm St., Lodi, Cal.

FOR SALE—EGGS FOR HATCHING from thoroughbred Mammoth Pekin and Indian Runner ducks, 75c per 12, $5.00 per 100. A. E. NELSON, El Monte, Cal.

THEY LAY AND WIN. ROSE COMB Black Minorcas. ELEANORE MINORCA FARM, Route 1, Los Angeles, Cal. Stock for sale.

BLACK MINORCAS OF QUALITY—Eggs $5.00 per 100. Ask for club catalog. S. D. BICKFORD, Gardena, Cal.

LIVE STOCK.

BERKSHIRE HOGS — POPULAR strains. Pigs. Young brood sows bred to Kingsclere Duke 3rd 111812. G. B. REEVES, Mountain View, Cal.

REGISTERED SHORTHORN BULLS and Poland China Hogs for sale. Best breeding. P. H. MURPHY, Perkins, Cal.

JERSEY BULL FOR SALE. THREE years old, muley. A good one. NICHOLAS MARTIN, R. D. 13, Box 81, Los Angeles, Cal.

FOR SALE—DUROC JERSEY PIGS, six weeks old, $5.00 each. Address W. J. COLE, Anaheim, Cal.

FARM LANDS FOR SALE.

FOR SALE—815 ACRES IN SAN LUIS Obispo County. A typical dairy ranch. Plenty of wood, water, irrigable land, buildings, fenced and cross fenced. Orchards, vineyards, oranges, lemons and walnuts do exceedingly well here. 40 acres of land suitable for these. Price $21 per acre. For further particulars apply to MRS. F. A. CLINK, Pozo, Cal.

2285 ACRES CHOICE, DEEP, SANDY loam. Ideal for subdivision or Eucalyptus growing. Can be cultivated any day in the year. Southern Pacific Railroad runs through the ranch. Also close to deep water for shipping. Free from wind and frost. Now all planted to grain. Price $100,000.00 for limited time. GEO. W. SILL & CO., Watsonville, Cal.

CALIFORNIA FARM HOMES NEAR Sacramento. Fine neighbors. Fruit center. Poultry very profitable. Oranges and vegetables harvest all winter. Not one serious drawback. Best water and cheapest irrigation. No floods. Perfect health. $75 per acre; easy terms. New town and electric railway. B. MARKS, Twin Cities Colony, Box 13, Galt, Cal.

GARDEN GROVE—FOR SALE, 10-acre walnut grove at Garden Grove. Majority trees one year old, choice budded, balance assorted fruit and bearing walnuts. Exceptional combination of fine soil, cheap water and choice location, on Pacific Electric. Seven-room house and outbuildings. Price $7000. A. F. CLARKE, Riverside, Cal.

IRRIGATED LAND FOR SALE, cheap. In the Lower Rio Grande Valley of South Texas. Ideal climate. Good markets. Large crops. Special inducements to several practical irrigation farmers. Address MANAGER, care of Cultivator, at once, or AMERICAN RIO GRANDE LAND & IRRIGATION CO., Mercedes, Hidalgo County, Texas.

IF YOU WANT NO. 1 GOOD LAND, see me. I have four eighty-acre tracts, all level, three miles from good markets, good crops, water, fenced. One tract is improved. Price $50 to $80 per acre. One-half cash, balance five years, 8 per cent. WM. T. MANTZ, Santa Maria, Cal.

ORANGE GROVES—ALL SORTS, AGES, conditions and prices. Groves in best districts. Six year's experience. References all banks in Claremont and Pomona. A. W. RICHARDS, Claremont, Cal.

APPLE ORCHARDS, LARGE AND small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. GEO. W. SILL & CO., Watsonville, Cal.

FRUITS, FLOWERS, SUNSHINE, progress—all these invite investigating beautiful Hemet Valley, Southern California. Booklet free. WILLIAM KINGHAM, Hemet, Riverside County, Cal.

FOR SALE—EL CAJON GRANT LAND. In the heart of El Cajon Valley, 30 acres of choice vineyard, large house, cottage and barn; trays, boxes, etc. Close to proposed electric line. S. B. HAWLEY, 1548 D. St., San Diego, Cal.

FOR SALE—PERRIS VALLEY, 640 acres choice alfalfa land, close to railroad, water guaranteed, $50, big snap. STACY REALTY CO., 531 So. Spring St., Los Angeles, Cal., F 2115; or Stacy-Wagner Co., Riverside.

WAUKENA, A GOOD PLACE TO farm hogs, alfalfa, grain, fruit successfully. Write C. F. COLWELL, Waukena, Cal.

MISCELLANEOUS.

HAVING OPENED A DAIRY SUPPLY house, would be glad to see all my friends and former customers. When in need of dairy supplies, milk coolers, cream separators, milk cans, milk bottles, etc., write or call GUY F. KELSEY, 108 East 8th St., Los Angeles.

FOR SALE—1160 FEET SURFACE IRrigating pipe, 8 in., good as new, $150, f. o. b. Richfield or Anaheim. Address J. L. DAVEE, Olive, Orange Co., Cal.

Business Notes

OIL POTS.

In the minds of a great majority of fruit growers, previous to the valuable results obtained from the use of small oil-burning heaters in orchards to prevent frost damage, frost prevention was something intangible, unproven and hypothetical. Today it is one of the most certain things as a means of protection against the ravages of frost that has been discovered.

This method is simple, and the expense sinks into insignificance by comparison with the financial results obtained wherever used. In practice the plan of action is as follows: The Electric Frost Alarm Thermometer is mounted within a shelter and set up in the orchard, vineyard or garden to be protected, and connected by wire with the sleeping apartment of the person having charge of the work. The heaters are then distributed to the number of 80 to 100 to the acre and filled with what is known to the trade as slop distillate from which the asphaltum base and soot elements have been extracted. This distillate may be had in unlimited quantities in Southern California at a figure somewhat less than the cost of the commonest crude oil.

The heater is of simple design, made to nest solid, occupying but little room in the orchard or in storage as shown by the fact that an ordinary box car will hold 30,000 of them.

With this system the small grower can protect an isolated acreage with ease and certainty, as well as can the larger grower, having full control of his heat at all times within the limits of his own ground.

These heaters require no attention from the time they are fired until the fuel is entirely consumed, covering a period of about seven hours.

The average cost of protection under this system should not exceed $5 an acre for a period of six years. With ordinary care these heaters should last eight or ten years. They can be had in Los Angeles or San Francisco, the price laid down to the grower being $20 per 100 heaters, and the Electric Frost Alarm Thermometer similarly lai[illegible] down for $22.50.—J. P. Bolton, Fresno.

The demonstration of the Frost Protection Company using slop disti[illegible] for fuel, which was made at P[illegible] last week, is reported to have b[illegible] complete success. The fuel pots we[illegible] filled and fired at 6:20 p. m. Without special effort 100 of them were lighted in five minutes. The pots burned without refilling until 1:45 a. m. The soot arrester was declared to be perfect in operation and no smutting of fruit was observed. The cost of this admirable process is represented to be 2¼ cents per night for each of the fuel pots.

EVERY DRUG STORE SELLS IT.

A very trivial thing oftentimes causes a horse to go lame, such as a slight wrench, a sprain, a cut, etc. These are things that are to be expected. They are liable to happen to any horse at any time. The lameness may cause inconvenience, but it is not otherwise serious. All that is necessary in many such cases is to be ready to treat promptly with some efficient remedy.

Almost everybody who owns a horse has heard of Kendall's Spavin Cure. Its popularity has not been confined to one locality or state. It is national, even world-wide. It is found on the shelves of well posted horse owners in many countries.

It is worth while to remember that Kendall's Spavin Cure has been in use for nearly half a century and its popularity is greater now than ever before. If it had not stood the test it would have been out of mind long ago.

This old favorite horse liniment is on sale at drug stores everywhere. The excellent horse book entitled, "A Treatise on the Horse and His Diseases," can also be had free at drug stores or by writing for it to the publishers, the Dr. B. J. Kendall Co., at Enosburg Falls, Vermont.

IMPROVED TRANSPORTATION METHODS.

The price paid for farm produce is determined largely by its condition when delivered to the consumer. The question of transportation was a very serious one a decade ago, inasmuch as the roughly constructed vehicles which were then used to transport perishable goods to the market were the cause of such a large shrinkage.

The farm wagon is one of the oldest and most necessary vehicles in existence. Its greatest improvement during the last twenty years has been in the addition of bolster springs, which make it practically a spring wagon.

Farmers interested in securing better prices for their produce should drop a card to the Harvey Spring Company, 737 Seventeenth Street, Racine, Wis., and ask for the catalog and particulars regarding free trial offer.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Trouble with Heifer.

I would like to have your suggestion as to what to do with my Jersey calf. I bought her in July last year and was told she was with calf. I let her run again in November as the promised calf did not come in October. Now in May she has started to give milk again, four quarts a day, very rich milk too, but there is no sign of her looking as if she was going to have a calf. She is three years old and never had a calf before I got her.—Subscriber.

It is probable the cow aborted and freshened in that way.

Bermuda Grass.

I send specimen of grass. Please give me its name and how to eradicate it.—Subscriber, Oakland.

The grass in the letter was a good lusty specimen of Bermuda, joint [illegible]ss, devil grass, or any other dia[illegible]al name which may be applied [illegible]. The naming of it is easy, but how to eradicate it is another matter. Clean culture, of course, will accomplish it, and in the orchard or garden such culture as should be given will keep it entirely out of the ground, but in the lawn or in alfalfa about the only remedy is to give a year or two of clean culture.

Sago Palm—Canariensis.

Can you advise me as to care of the sago palm, also the date "not of commerce?" I have four of these over twelve feet in circumference. Can one grow vines in their limbs?—C. N. Ambrose, Palm Knoll, Escondido.

The Cycad commonly called Sago palm will grow in open sunlight, but should have fertile soil and must not be stinted in watering. Some gardeners prefer to grow it in partial shade.

No special care is needed for the dates, which doubtless are Phoenix Canariensis, except plenty of water and fertilizer, if a rapid growth and fine rich colored foliage is wanted. It is possible to grow vines and ferns in the stubs, but the almost ceaseless attention needed in our arid atmosphere renders it hardly worth the effort—especially back from the Coast. A better way is to plant ivy (English) or Ivy Geranium around the base of the tree and they will climb the trunk of their own accord and they are easily watered.

To have ferns or vines grow in the stubs it will be necessary to pack the spaces with a mixture of soil and sphagnum (moss) and plant in that. This can be kept in place by fine copper wire and the moss will not only hold the soil, but retain moisture longer than almost any other material. —Q. A. L.

Squash Bugs.

I enclose what we call pumpkin bugs. They are causing me much trouble. What will eradicate them?—C. L. T., Visalia.

The bugs sent were genuine squash bugs. Circular 39 of the U. S. Dep't Agriculture, Division of Entomology gives more particular information, and from this we take the following method of control:

"Hand-picking early in the season.—A lookout should be kept for the bugs early in the season and these as well as the eggs should be picked off or cut away with shears and destroyed. The eggs, on account of their large and conspicuous appearance when deposited in clusters while the vines are young, are readily seen, and the grower should make a practice at the beginning of each season of going over the vines every few days. Such young as may hatch in spite of these precautions may be killed by kerosene emulsion if applied upon their first appearance.

"Trapping the bugs.—The bugs may also be trapped by placing about at intervals on the ground through the garden, boards, shingles, pieces of bark, or similar material, to which the insects will be attracted for shelter. Here they should be looked for and destroyed every morning or so during the early season.

"Protection to cucurbits other than squash, and perhaps pumpkin, can be secured by growing these plants with the others to serve as trap crops. Attack will thus be centered upon a few plants where the insects can be the more readily controlled.

"Other methods.—A number of the remedies in use against the striped cucumber beetle and other insect enemies of cucurbits will assist in the destruction or control of this species. Among these are the protection of the young plants with coverings, the use of repellants such as land plaster or gypsum saturated with kerosene or turpentine, the planting of an excess of seed to distribute attack, the stimulation of the growth of the plant by manures and other proper fertilizer, and lastly, clean cultural practice. If the precaution be taken to gather the vines as soon as the crop is harvested and burn them, many bugs in their different stages will be destroyed and the crop of insects will be reduced for the ensuing year."

Asparagus.

Can you tell me where to obtain asparagus plants and which kind is the best and when is the best time to plant same?—C. N. Ambrose, Palm Knoll, Escondido.

Almost any nurseryman or seedsman can furnish asparagus plants. I know of no better variety than Dreer's Eclipse, but any of the leading varieties will produce good asparagus if the culture is good. February or March is best time to plant.—Q. A. L.

Watermelon Query.

What is the best way to plant watermelon seed so it will be sure to come up? Many of my plants wither as soon as they are up, and it looks as if something had eaten the stalk off the root. What is the cause and how can it be prevented?—S. B., Chico.

If the soil is in good mellow condition, and not too dry, and the seed good, there should be no trouble in having them come up. Do not cover too deeply. I usually cover about half an inch and then put a light mulch over that of light well decayed manure or old planing mill shavings. This prevents the soil from baking. It is impossible to tell from the querist's data just what is eating off the plants or what causes them to wither. If they are not cut entirely off, but seem decayed just at the surface, it may be caused by a borer that often works in the heart of the young plant, or by a fungus which produces that condition we call "damping off." —I know of no practical remedy.—Q. A. L.

(Continued on Page 71.)

FREDERICK C. ROEDING PASSES INTO THE NIGHT.

In the death of Frederick Christian Roeding, which occurred in San Francisco on the evening of July 17, there passed into the Beyond another of that gallant band of early Californians who builded an empire with commercial horticulture as its basic foundation. His death was not wholly unexpected, as oncoming age testified to its progress in the fact that he had passed his eighty-seventh birthday.

At his bedside when the spirit left its abode were his two sons, Henry and Frederick, and Mrs. Roeding; his son George, of the Fancher Creek Nurseries, happened to be away on business in Portland, Oregon, but he was at once informed and hurried to San Francisco.

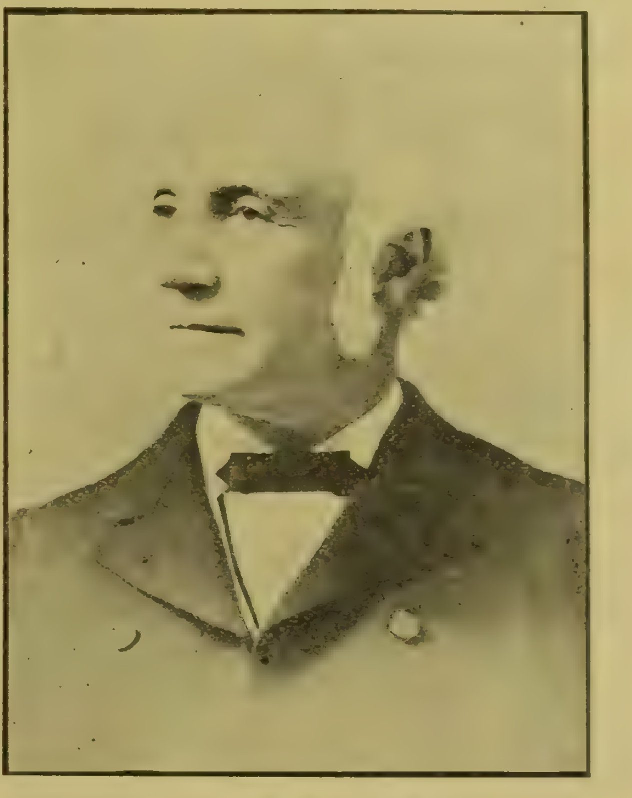
From a short sketch of his career appearing in the Fresno Herald, the Cultivator gleans the following facts touching on his agricultural interests:

"Mr. Roeding was one of the pioneers of California. He came to San Francisco in the early days and was one of the founders of the German Savings and Loan Society of that city, of which institution he was cashier for many years. In the '70's he came to Fresno as a member of a German syndicate and took up vast parcels of land, among these being the site upon which the city of Fresno now stands.

"Later the syndicate divided the land among its various members, Roeding receiving as his share most of the land now occupied by this city and also large holdings to the west. among these being the Eisen and Sunnyside vineyards and Calmyrna and Temperance colonies. Gradually the town property was disposed of until now his only city holdings consist of five lots in the 1200 block on J street. Three of these lots are occupied by the Fancher Creek Nurseries' city agency, of which his son George C. Roeding, is the head.

"Roeding Park will always stand in Fresno as a monument to the deceased capitalist. This park, which is considered one of the best in the interior of the state, was donated by the deceased to the city. It consists of 117 acres, all of which was received by Fresno free of all encumbranches."

Possibly the chief event associated with the name of Roeding connects it with fig culture in this state. As early as 1886 the elder Roeding was planting this fruit in Fresno county, and in the same year founded the Fancher Creek Nurseries. In its earlier development the fig business was more or less precarious, until 1897, when his son, George C., was largely instrumental in introducing and establishing the fig wasp, Blastophaga grossorum, and fig culture became at once one of the great horticultural assets of Central California.



Frederick Christian Roeding.

TWICE VALUABLE.

The writer has found by analysis that lemon blossoms and geranium flowers (the large red variety,) contain practically the same percentage of phosphoric acid in the ash, and the percentage is large. The lemon blossom, however, contains much the larger percentage of ash.

This is probably why an abundance of superphosphate or some other supply of available prosphoric acid is so necessary for fruit trees at and before blooming time.

While phosphoric acid is needed for producing a profusion of flowers, nitrate is the chief agent of growth, and has the effect of making large and magnificent flowers of all kinds.

Nitrate of soda also possesses decided insecticide powers, which seems to be confirmed by the experience of a Redlands greenhouse man. He says in a communication to the Times: "Not only did it prove a valuable fertilizer, but it either destroyed or drove away an army of wire worms with which my greenhouse had long been infested, and for which I had tried many exterminators."—R. R. Snowden, Chemist and Soil Engineer.

Household Department

THE HOMESTEADER'S FAREWELL

Farewell to my homestead shanty;
  I've made my final proof;
The cattle will hook down the wall,
  And some one will steal off the roof.

Farewell to my sheet iron stove,
  It stands in the corner all cold;
The good things I've baked in its oven
  In language can never be told.

Farewell to my nice little table,
  Whereunder I've oft put my feet,
And chose from the bounty of good things
  The substantials of life for to eat.

Farewell to my cracker-box cupboard,
  With a gunnysack for a door.
Farewell to my store of good things,
  That I never shall want any more.

Farewell to my downholstered chair,
  With its bottom all sagged to the ground;
Farewell to socks, shirts and breeches
  That filled it again to the round.

Farewell to my little pine bedstead,
  'Tis on thee I've slumbered and slept;
Farewell to the dreams that I dreamt,
  While the centipedes over me crept.

Farewell to my tea and my crackers,
  Farewell to my sorghum and buckwheat,
Farewell to my lalakadope.

Farewell to my sour dough pancakes,
  That none but myself could endure;
If they didn't taste good to a stranger,
  They were sure the dyspeptic to cure.

Farewell to my entire homestead;
  Farewell to your hills and your sand;
I've covered you up with a mortgage,
  Farewell to my quarter of land.
—Unknown.

SPEAKING OF HATS.

MOST persons," said the peevish girl, "can remember the time when a hat was merely a hat. Since it was just a covering for the head nobody paid much attention to it and the head itself was the main thing. That time has gone—gone forever, I fear.

"Nowadays—well, no one has time nowadays to stop to consider anything because if one does not have to rush to catch a train one has to hurry to escape being late for a dinner party or to keep one's appointment at the dressmaker's. Still, if a person were laid up with a broken leg, say, or something calming of that sort and really dwelt upon the subject it readily could be realized that hats have become a far different matter.

"I know a tiny hat store that is about as big as a minute," went on the peevish girl. "It looks entirely harmless and subdued. It is exclusive, certainly. Nobody wants to buy a hat anywhere but at an exclusive place. While on an exploring trip recently I found my way into this little hat shop. I had a defiant expression in my eye because I had resolved that if the usual languid and gorgeous person in black floated up and asked the usual $40 or $50 for a head covering worth almost $10 I should icily refuse to be robbed and walk out. Still, I wanted to see what there was in the shop.

"I saw before me a small, three-cornered hat of black velvet, utterly unadorned save for a bunch of feathery aigrettes on the side. I glanced inquiringly at the gorgeous person who was surveying me as though at last she was gazing upon the murderer of her beloved grandmother.

"'That?' echoed the gorgeous person. 'That little chapeau is—let me see—it is $115.' She brushed a speck of dust from her shoulder as she finished.

"'Buy why?' I asked her when the room had stopped whirling around. I had not meant to betray surprise at anything in the hat shop, but human flesh and blood could not stand this sledge-hammer blow.

"The gorgeous person regarded me with extreme dislike. 'Those are aigrettes on it,' she murmured, indifferently.

"'Oh, yes—aigrettes," I repeated. 'To be sure. But excuse me— do you mean to say there are women in the world who actually hand over $100 or so for a thing that hasn't any more to show for it than that?'

"Then while the gorgeous person showed signs of apoplexy I made my escape. On the street I watched the hats. If I saw a particularly plain, unnoticeable one I knew it had cost enough to support a family for a month. All the faces beneath the hats were harassed and tense as the owners flew along. The owners either were on their way to buy more hats or had just escaped from the clutches of gorgeous persons in hat shops.

"You know," explained the peevish girl, "you are always buying hats nowadays because one for best and one for every day simply will not do at all. Neither ever is just the thing for the gown you want to wear, and you end by buying a hat when you buy dress goods just as much as you order the hooks and eyes and trimmings.

"As for plumes—all the ostriches on earth must be going around these days in a terrifically decollete state, for there are enough feathers at large in Chicago alone at the present moment to clothe decently all the ostriches that were ever created. To see them in their full and impudent glory step into any fashionable cafe after the theater.

"'No, I'm not ill or anything," I said to my escort the other night, 'but I haven't time to eat. I'm counting. Why, willow plumes, of course. There's a gray one back of you a yard long that never cost a cent under $75. And look at that white hat with three plumes—I suppose there is a girl concealed under it somewhere—and over there see those heliotrope ones. That heliotrope hat certainly set back father's bank account $150 at least. And there are bushels of black feathers $50 apiece. Why, I can't see anything but a sea of yellow plumes! It isn't a cafe—it's just a forest of hats with people lost in the shadows underneath paying checks for food they haven't time to eat because every living girl is looking to see if anyone has a willow plume handsomer than hers!'

"The reason the milliners ask and get about 500 per cent on their investment is perfectly plain," declared the peevish girl. "It is all the fault of feminine creatures like one I saw in a store not long ago. While wandering around in the millinery department this woman pounced with a little cry of joy upon a hat in a case. She put it on and positively cooed with rapture.

"'Why,' she told the attending clerk, 'if I had looked for a week I never could have found anything so precisely what I wanted. It's exactly what I had in mind! It just finishes off my suit. Look how well they go together. How much is it?'

"'It's marked $12,' said the clerk.

"The jubilant customer stared. 'Take it away!' she cried. 'Only $12! There must be something wrong with it! Everybody I know would say I was wearing a cheap hat! No, I don't want it! There's nothing here that will suit me!'

"If one could catch and suppress all the women like that maybe one could ask the price of a hat nowadays without clutching a bottle of smelling salts firmly in one hand!" ended the peevish girl.—Universal Magazine.

USEFUL IN THE KITCHEN.

There is nothing more useful in the kitchen than some abestos mats and these can be bought for a trifle, or you can buy the asbestos and make the mats any shape or size you want. The small mats are especially useful to save scorched food if you have no double boiler, as one can be used when heating the milk for toast and one can be placed under the pan when cooking oatmeal or custard. Place a good sized asbestos mat around the front of the stove on the floor to prevent any danger of coals falling from the stove and burning holes in the floor or floor covering. It is a good plan to have small boards or sheets of heavy paper ready to place on the table on which to set a hot sauce pan or kettle and thus protect the table. These can be kept out of sight when not in use.

Another good plan is to keep an old soft cloth hanging in a convenient place ready for drying the hands. There is nothing better for this purpose than pieces of old knit underwear, as they are soft and easily washed and they are a great saving to the kitchen towel.

To keep your dishes shining with very little work, wipe them out clean with bits of soft cloth or paper, then put as many in the dish pan as it will hold without crowding, sprinkle enough pearline through them to make a good suds, then pour enough hot water over your dishes to cover them and let them stand while you attend to some other work. When ready to wash the dishes, have a pan of clean hot water ready, run a dish mop through the dishes in the pan, put them in the clear water and dry with one clean towel and polish with another and the dish washing is done in a few minutes. This suds is excellent for washing fine china and glass, but these pieces should be washed separately and as quickly as possible. Sal soda added to the suds for scrubbing tables and floors makes them white and saves labor, and tinware may be kept shining by dipping a damp cloth in soda and then rubbing the tin and polishing with a soft, dry cloth, and this is a good way to brighten china dishes when they have become dark or discolored.—Martha.

SOME OF NATURE'S REMEDIES.

An excellent remedy for wounds from rusty nails, hay forks, or other such accidents is made by bruising peach tree leaves and binding over the wound, changing them every three or four hours until all soreness is gone; and there is nothing better for a sprain than bruised peach leaves bound securely over the member that is wounded. An excellent remedy for a bee sting is made by crushing a plantain leaf and binding over the sting. A remedy that is said to be fine for asthma is made by gathering about six double handfuls of peach tree leaves, boiling them, then squeezing the juice out—there should be about one quart. Add this to one quart of good molasses and cook to a candy, then pull and cut into small pieces and take a piece five or six times a day.

To keep water bugs out of the house, soak cucumber peelings in water, and at night-fall, scatter them about the pipes and drains.

A good cucumber cream is fine for the complexion and it is easily made. Slice a ripe cucumber, peel and all in a bowl, then cover with fresh sweet milk and let stand for half a day, strain and bottle. Wash the face and hands at night in warm suds and soften the water by adding a little borax, then rinse the suds off with cold water softened with a little borax, as hard water will ruin the skin, and after drying the skin with a soft towel, apply the cucumber lotion to the face and hands with a soft cloth and let it dry on the skin. Mutton tallow melted and softened by adding oil and borax, well rubbed over the face before going out in the wind and sun, will prevent the skin from tanning and burning.

To make an excellent remedy for salt rheum, slice pokeberry root and fry it in lard, and rub on the hands three or four times a day. A good remedy for poison oak is made by mixing equal parts of quinine and lard and applying to the affected parts. To make a good remedy for perspiration, get one pound of oak bark and steep for half an hour in two quarts of boiling water, then strain and bottle and add two teaspoonfuls each of powdered starch and borax and half a cupful of the lotion to a basin of water is about right.—M. H.

MEAT COOKED WITH VINEGAR.

Dishes in which vinegar is used to give flavor as well as to soften the meat and make it tender, are the following:

Sour Beef.

Take a piece of beef from the rump or the lower round, cover with vinegar or with a half-and-half mixture of vinegar and water, add sliced onion, bay leaves, and a few mixed whole spices and salt. Allow to stand a week in winter or three or four days in summer; turn once a day and keep covered. When ready to cook, brown the meat in fat, using an enameled iron pan, strain the liquid over it and cook until tender; thicken the gravy with flour or ginger snaps (which may be broken up first), strain it, and pour over the sliced meat. Some cooks add cream.

Sour Beefsteak.

Round steak may be cooked in water in which there is a little vinegar, or if the time is sufficient, it may be soaked for a few hours in vinegar and water and then cooked in a casserole or in some similar way.

SWEET PICKLES.

A lady writing to the Rural New Yorker says that the first of the following recipes is the "very best for sweet pickles I ever saw."

Put cucumbers in cold weak brine (½ cup salt to one gallon of water) for 24 hours. Take out and dry on cloth. To one gallon vinegar add two cups of sugar and nearly one ounce of mixed spice, heat boiling hot. Put in pickles and let boil up once. Put in cans immediately, and pour hot vinegar over them; seal up. They keep well, and are very nice.

Another recipe is as follows: Let the cucumbers stand in salt water three days. Heat the brine once or twice and pour over them. Drain; put in a jar and pour over them hot vinegar with cloves and cinnamon in a bag; two-thirds cupful sugar to quart of vinegar; put in plenty of horseradish and this will keep sealed or open. Put in a little alum t make them brittle.

GIRLS, READ THIS.

There is nothing so pretty in the manner of a young girl as courtesy towards the aged. It may be pleasanter to turn and listen to the giddy remark of some girl of your own age rather than to that of some elderly woman, but it does not put your disposition in anything like so becoming a light. Do not neglect the elderly guest in your home. If you only knew how much the delicate attentions of youth particularly are appreiated by age you would be no niggard in bestowing them. You will, too, always be the gainer by such thoughtfulness, the gainer in wisdom, love, and, above all, that greatest attraction in a girl's disposition, unselfishness.

Your Greatest Help in Reducing the Cost of Living Is Our SPECIAL GROCERY CATALOG

THIS BOOK FREE

52 pages of vital importance on how to save money by buying from the Largest Mail Order House in the West. The Secret of Better Buying is a matter of vital value to every household; to know where every dollar goes to bring the best results is a protection to the home. Our Grocery Catalog is the messenger of wholesale prices, heralding what goods are actually worth. It delivers you from high prices.

OUR PRICES are one-fourth to one half less than your local dealer's. If his price is $10 for an article, you can buy the same thing of us through our catalog for $7.50 and less. This applies to all classes of goods. Because of this enormous saving, most of our customers buy all their supplies of us. They consult our catalog every time for any goods they use. It is a reference book on low prices. They save at least 25c on every dollar's worth of goods they buy from us. It's worth while to save 25c on every dollar's worth of goods you buy. The 25c saved is just like you had worked hard to earn it.

IT WILL PAY you big to buy all or as much of your goods as possible through our catalog. Besides the great saving you can make through trading by mail with us, it's the easiest and most satisfactory way of buying goods. there is no hurry or confusion, no worry that you are taking up a salesman's time if you are a bit slow in making a selection, and in the seclusion of you home, surrounded by your family you can select the goods you need from our big catalog with best judgment and greatest economy. The United States mails will speedily bring us your orders and flying express, mail or freight trains will carry the goods to you with the greatest dispatch and perfect safety.

OUR GUARANTEE is to safeguard your interest to every extent that we will give the service you have a right to expect, we stand back of every statement we make and your money, together with transportation charges and any further expense you may have incurred, will be promptly returned to you if you are not satisfied. Every article in this catalog is, therefore, offered with the understanding and agreement that it must satisfy you perfectly, and if there is the slightest dissatisfaction because of quality, style, size, color or any other reason, we expect you to return the purchase to us at our expense. Does the retailer make you this offer? Ask him! REMEMBER THAT THE RISK IS ALL OURS.

Our Unqualified Guarantee—"SATISFACTION OR YOUR MONEY BACK"

Hay.

Scott, Magner & Miller report:

Arrivals of hay for the past six days have been 3000 tons. This amount shows a decrease from the preceding week.

Operations in the country for the current week show a lack of any activity, and in many of our hay sections no hay to speak of has moved from the hay fields, but is piled up and awaiting buyers. Export trade and coastwise shipments have been light. A little fancy lightweight wheat hay commands our topmost quotations. The bulk of the wheat hay that is being sold here at the present time has been wholesaled at from $10.00 to $11.50 per ton. A choice article in red oat hay is also in favor.

Arrivals of alfalfa hay have been very light, and our market here is carrying very little of this type of hay at the present time. We anticipate an active demand to commence shortly, as the question of purchases for winter necessities must soon be taken up.

Deciduous Market

SACRAMENTO, July 16, 1910.

The California Fruit Distributors reports:

The following gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning. July 15, 1910.

Peaches.

One hundred and twenty-three and three-fourths cars. Demand for peaches during the past week has been exceptionally good, considering the large quantities of southern peaches now being received in Eastern markets. Early Crawfords are now practically finished and a very satisfactory crop of late Crawfords, Susquehannas and Elbertas is now available. In clings we have Tuscan to offer. The bulk of the peach offerings of this state will be made during the next two weeks, after which time supplies will materially decrease. Quality of the fruit is first class.

Plums.

One hundred and ninety-eight cars: Giant, Diamond, Wickson, California Red, Sugar, Gros, Kelsey, German, Fellenberg, Quackenboss, Imperial and Grand Duke plums will be available in comparatively limited quantities during the coming week. Heavy movement of plums is now over.

Pears.

Two hundred and ninety-one and a half cars. As will be noted, there is a heavy increase in the movement of this fruit since our last report. Pear shipments, however, have now passed their zenith and will decline from this time on. Canners are now in the market taking liberal supplies at good prices, which will certainly interfere with the free movement of this variety for Eastern shipment. The heavy movement from the River will be followed by liberal shipments from Suisun and Vacaville, which may be expected to continue during the netx two or three weeks.

Grapes.

Five and three-fourths cars. Some Fontainbleau from the early sections, and a few cars of Thompson Seedless from the Fresno district, are now going forward. Shipment of this variety may be expected to increase from day to day, and next week should see a free movement. The fruit is of unusually good quality. Tokays are now coming along in fine shape and promise to be considerably better than usual. There will be no black grapes available until about the 25th.

We are pleased to report that the splendid f. o. b. demand for California fruits mentioned last week has continued, and we have sold unusually large quantities. The season for California tree fruits will be shorter than usual this year, owing to the greater earliness of the season.

Citrus Market

LOS ANGELES, July 20, 1910.

With some Valencias commanding $6.00 and even $7.00, it is feared that the orange market may be injured by stopping the demand, but with the limited number of cars yet to go it is entirely probable that good stiff prices will prevail. At this time the demand for them is almost fierce. Even the auctions show remarkable returns.

Lemons are shading slightly, principally because the weather has not been so favorable for large consumption. The decline is very slight and such as would naturally be effected by weather conditions.

Shipments.

Total shipments of citrus fruits since November 1, 1909: 26,832 cars, of which 23,068 were oranges and 3764 lemons. To same date last year: 33,267 cars, of which 28,298 were oranges and 4967 lemons.

NEW YORK, Monday, July 18.—The car of California lemons advertised for today did not arrive in time to sell. There was a strong and fairly active market for California oranges at auction today and the fancy fruit brought somewhat better prices. On the offerings of average quality, however, there was no quotable improvement. Eleven cars oranges sold. Market steady on good stock, easier on poor fruit. Cloudy, cool.

APRICOT INFORMATION.

The advantage of co-operation is so great and is so well understood that it is useless to say anything further about it.

The apricot raisers of Orange county have organized a county association which is in a fair way of being a success.

We believe that the benefits we will derive from the association this season will be so plain that associations will be started wherever there is dried fruit for sale, and that finally these local organizations will be combined in a state association, similar to the walnut growers.

When this is done, we will be in a position to secure the best price that the market affords, in fact we will be in a position to a certain extent to make the price ourselves. Just now, what we need, is an accurate knowledge of the extent of the present crop. We need this in order to make a price at which we will sell our fruit for this season. We have made a preliminary price of 10 cents per pound based on such information as we have been able to get.

But we want more accurate information and ask every grower of dried apricots to send us a postal card, answering the following questions:

What county?

How many pounds of dried apricots had you last year?

How many pounds this year?

How does this year's crop compare with last year's in your vicinity?

These questions are few and simple, yet they will be of great benefit to us if answered by every grower who reads this.—A. C. Tiede, Santa Ana, Cal.

Queries

(Continued from Page 67.)

Noxious Weeds in Road.

Touching upon a point raised in recent query in the Cultivator regarding who pays for noxious weed eradication on the highways, we wrote to State Horticultural Commissioner Jeffrey and have from him the following:

"Section 2645 of the Political Code requires noxious weeds to be removed from the public highways by the road overseer at least once a year. This might or might not be done at the proper time to abate a nuisance. For instance, if cockleburs were removed just after the seed was ripened it would not be an attempt at abating the nuisance, hence we must fall back on the county horticultural law which does not limit the eradication to one attempt during the year.

"It is the duty of the Supervisor or his overseer to eradicate or remove weeds, but the law has not made that duty sufficiently strong, consequently we must rely upon the county commissioner, although this, of course, should not prevent the road overseer doing the work when the commissioner demands it. In fact, that is the way it has been done in Los Angeles county by the county commissioner authorizing the Supervisor to have the weeds cut out of the right of way in his district.

"As a legal proposition, there is a point which I cannot settle, namely, whether the county commissioner should serve notice on the abutting property owner, the Supervisor, or the road overseer. I do not think this point has ever been passed upon in the State. If it has, I have never heard of it. This, I assume, is the gist of your inquiry, as you evidently understand the law in all other respects. It would be a curious circumstance should the overseer refuse to abate a weed nuisance; it being abated by the commissioner and the bill brought before the Supervisors for payment out of the general fund as the law requires; the question arising how to make that road district fund pay for the extermination of the weeds as it should. You see what a strange point this would bring up. The law would compel the Supervisors to pay the bill out of the general fund, and I believe the road district fund would escape payment in that way, which would be unfair to the county.

"However, it appears that the abutting property owners are responsible for the condition of the shade trees and other matters relating to their claim upon the right of way on the road,so you see you have asked me a question leading into entirely new lines. The Dept'y Atty. Gen'l was not able to answer it today off hand, and seemed very much puzzled over the case as I presented it. This was before I received your letter, as I had another inquiry regarding the same matter. As soon as I receive an opinion from him I will communicate with you regarding it."

County Commissioner Pease of San Bernardino writes referring to Section 2645 which he thinks is sufficient.

Leaf Cutting Bees.

Mrs. I. A. Newton of Corona, Riverside county, sent in rose and other leaves from which circular pieces had been cut; also small cylindrical cells or cases made of rolled portions of leaves and capped with small round bits of the same size as the holes in the leaves. These cells were apparently the home of the young of some insect. Some of the cylinders contained only pollen or "bee bread." They were sent to Prof. C. F. Baker of Claremont and he writes:

"Sometimes roses are found almost defoliated by neat circular and oblong pieces cut out of the leaves, and here at Claremont I have found many other shrubs attacked in the same way. We are often asked about this very neat and regular cutting of the leaves—the specimens you send are good samples of it. This work is done by certain wild bees called leaf-cutting bees, and if careful watch is kept for a time, one may observe the whole operation. The bees use these pieces of the leaves to build the cells of their nests, using the longer pieces for the sides of the cells and the circular pieces for caps. The cells contain only bee bread and the young larvae, and are placed in burrows in wood, or in pithy plant stems, or in almost any suitable crack or cranny. We have numerous sorts of these interesting bees in Southern California. They rarely cause serious injury, and in my own garden at least are always very welcome visitors."

Self Milkers.

I have cow that milks herself. Is there remedy?—C. T., Blackburn Gulch, Santa Cruz.

We refer our inquirer to Mrs. Sherman's article on this subject in Cultivator of October 28th, 1909.

Littlerock.

Please give information regarding Littlerock, California. Is the land there alkali? Will it grow good alfalfa? What are the drawbacks? Is there plenty of water?—Subscriber.

Littlerock is a small place some miles from the railroad in the Antelope Valley in northern Los Angeles county. It is near the San Bernardino mountains and we presume has water. We will ask our Antelope Valley friends to give us more explicit information.

Veterinary

Answers in this column by Dr. R. T. Whittlesey, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Worms.

My collie pup at times gets so weak and stiff in hind legs it can hardly move. Eats fairly well when he has those spells, but is very thin. Has a short broad white worm. Could that be cause of trouble? Have given him worm powder but without effect.—C. E. U., Hanford.

He probably has tapeworms. It is very difficult to keep a dog from vomiting up worm medicine as fast as you give it to him. You will have better results from salt water enemas. Make as strong with salt as cold water will dissolve. Use a fountain syringe, injecting all he will possibly retain. Tie him so that you can see results. Tape worms are made up of a string of segments about ⅛-inch long. They will come away in a few minutes after enema has been given. Repeat treatment in a week.—R. T. W.

NITRATE OF SODA

No Hoof, No Horse

U. S. statistics show that 80 per cent of all horses are lame and that 80 per cent of the lameness is caused by hard and contracted feet. As a hoof softener, toughener, nourisher and grower there is nothing equal to

Eshelman's Wool Fat Hoof Healer

A horse's hoof is from 60 to 70 per cent water. Grease and water will not mix. There is no grease about Wool Fat. It mixes readily with water, is very penetrating, and while a great medicine of itself, it also acts as a vehicle to carry to the afflicted parts the other medicinal properties of the HEALER. It is absorbed into the skin and gives natural stimulation and nourishment to the hoof. There is nothing that can compare with it for this purpose, nor as a remedy for contracted hoofs, split hoofs, quarter cracks, mud fever, corns, grease heels, and for all kinds of sores and cuts anywhere on any stock. If you have tried it, you know that this is true. If you have never tried it, it will surprise you with its power as a healer and restorer. It is not a new remedy, but has been on the market in the East for many years, where it has given the greatest satisfaction.

4 oz. package, 25c; 12 oz., 50c; 32 oz., $1.00; 5 lb. pail, $2.00; 10 lb. pail, $3.50. It is easy of application. Directions with each package.

TRIAL OFFER.

We will send you a 2-lb. can, use it 15 days, and if satisfactory, send us $1.00. If not, write us to that effect, and you need pay nothing. We take all the risk, you just try it. Send for it today.

Utility of Good Roads and the Motor to Farmers

How Well-Made Highways and the Automobile Will Make Farm Life More Attractive and Profitable. Both are Advocated by the National Grange.

THIS article deals from the viewpoint of the farmer with what after all is a farmer's question—the present high cost of food. It gives the farmer's ideas about the cause and cure of the evil described by Mr. Jas. J. Hill as: "An enlarged city life and a neglected country life, a crowded artisan population clamoring for food, a foreign demand for the product of their wages limited to fields where the competition of all the world must be met and overcome." While the newspapers and magazines have lately been full of remedies for existing conditions, they have mainly been put forward in the interests of the cities. The side of the question which seems to have been neglected is how the whole matter affects the man who is being asked on all sides to come to the rescue, the man who lives on the soil and raises the nation's food supply, the farmer himself.

The first fact which should be brought out is that it is not the farmer who is responsible for the present high cost of living, and that it is not he who is principally benefiting by the present high price of wheat, beef, mutton, pork, corn or milk. It is true that he is receiving more for his produce than he did twenty years ago, but the increased reward of farming is only in line with the general increase in values all over the world. It must be remembered that the wages of farm labor, and the price of practically everything that the farmer buys, have increased in the same proportion.

Take the typical case of wheat. The retail price of flour in 1893 was $4.50 per barrel. The retail price of flour today is at the rate of $7.00 per barrel. Of the difference between former and present values the farmer gets about $1.00. The remaining $1.50, represents a change in the conditions of distribution. It means city prices as compared with country prices, and includes the speculative profits of the middleman. The divorce between the food producer and the food consumer, due to the overcrowding of the cities and the relative depopulation of the country districts, has placed the control of the country's food supply in the hands of a class who are speculators first and distributors afterwards. It is in the fact that the population is becoming more remote from the sources of food supply rather than in the fact that food production is more costly than formerly that the real reason of the present high cost of living must be sought.

In 1804 only 4 per cent. of the population of the United States lived in cities. At the present time the percentage is over 40. One interpretation of these figures—the one insisted on by Mr. Hill—is that whereas in 1800 there were 96 cultivators to supply four non-cultivators, at present probably not over 30 in every 100 people are in the agricultural sense producers. But it should be remembered that the general employment by the modern farmer of agricultural machinery, which makes the modern farm hand at least six times as efficient as his predecessor, prevents his relatively decreased numbers from having much effect on prices. What is important in the above figures in relation to the cost of living is that every increase in the urban population, and every decrease in the country population tends to put both producer and consumer more and more at the mercy of the middleman. An individual farmer has about as much chance under present conditions of determining what he shall receive for his milk, vegetables or corn, as the consumer has of determining what he shall pay for these products. The only remedy from the viewpoint of both the consumer and farmer, is such cooperation among the farmers as will enable them to deal on equal terms with the distributors. (See Report of the Country Life Commission appointed by President Roosevelt, which found that the principal and most pressing need of the rural districts was "effective co-operation among farmers to put them on a level with the organized interests with which they do business.") And this again is a question of convenient access both between farmer and farmer, and between farmer and consumer.

Translated into practice, access means roads. As we proceed we shall see that it means roads plus something more, but good roads at least are necessary. For the present let us see how far a system of highways similar to that existing in France would tend to reduce the cost of living.

Every commodity pays a "wheel tax," since nothing is nowadays produced where it is consumed, and a direct result of the crowding of the population into the industrial districts is an increase in the retail price of food due to increased haulage. The important fact is that the necessary increase of cost from this cause is many times greater than it need be, owing to our backward system of rural communication.

It has been calculated that the average length of road haul of agricultural produce under present conditions of rural transport is ten miles, at a cost of twenty-five cents per ton mile. The aggregate amount handled is at least 200,000,000 tons annually. In fact this figure is far below the actual total, for it only takes account of produce actually delivered for shipment to the railroads, and makes no allowance for produce shipped by water, or for coal, lumber, supplies, machinery, etc., hauled from the depots to the farms. This gives us as the direct "wheel tax" paid by the ultimate consumer, the gigantic annual sum of half a billion dollars. Many years of experience in France, Germany and England, have shown that on improved roads in fair condition the ton mile cost should never exceed ten cents. This would give the cost of hauling 200,000,000 tons an average distance of ten miles as $200,000,000. In other words, there is a direct addition to the cost of living of the nation as a whole of $300,000,000 per annum, which is quite unnecessary and due simply to our inferior road systems. If we take the total road mileage of the United States as 2,000,000 it follows that every mile of unimproved road means a net loss to the country of at least $150 per annum. And this charge is actually met in the shape of increased food prices, principally by the class who can least afford to bear it—the wage earners.

While the substitution of good for bad roads would directly reduce the cost of living by reducing the haulage cost on food products, the indirect effect in the same direction would be even more important. It has been proved that in every case where the roads have been improved, the rural population has increased. To quote Senator J. H. Bankhead of Alabama: "The trend of population from country to city is most apparent in those sections of the country which are isolated by reason of bad roads. An example illustrating this point has been cited by the United States Office of Public Roads, in which it is shown that in 25 counties showing an increase of population from 1890 to 1900, averaging 30,000 to the county, 40 per cent of the roads were improved and maintained in first-class condition, while in 25 counties in the same states showing a loss of population in the same period of 3,000 to the county, only a little over 1 per cent of the roads was adequately improved." Thus the congestion of the cities, which is at the very root of the question of the increased cost of living, would be directly relieved by the construction of adequate roads.

Another result of road improvement is the accompanying increase in the value of the adjacent farm lands. This is of course a direct gain to the farmer, but it is not a selfish gain, for the enhanced value of the land is due to the fact that it can render better service in food production. Land does not remain uncultivated because it cannot be made to grow anything, but because it does not pay to cultivate it. Make such land accessible and it at once becomes valuable as a source of production.

To quote Senator Bankhead again: "It is rarely the case that the average increase is less than 20 per cent. of the total value, while numerous examples can be cited of increases exceeding 100 per cent. The last Federal census, taken in 1900, shows that there has been an increase in the farm values of the United States amounting to 27 per cent and that only four states of the Union show a depreciation of farm values. Massachusetts shows the largest percentage of increase in these values and this increase has developed since the policy of state aid for road improvement was adopted. Prior to that time the farm values in that state were depreciating."

One more consideration: Mr. Hill, in a speech printed in the N. Y. World of April 3, attributes the high cost of living to the fact that we are living too extravagantly. He holds that we are wasting our dollars in unproductive expenditure instead of using them as capital. And he cites France as a shining example of the beneficial results of natural thrift. "The wealth of the French people," he says, "increases by about a billion dollars every year. This increment may be drawn upon by enterprise anywhere. It is not gathered in huge fortunes, but distributed among millions of holders in small sums." France has the most superb road system in the world, and Mr. Francis B. Loomis when commercial agent at St. Etienne, France, reported that: "It is the opinion of well-informed Frenchmen who have made a practical study of economic problems that the superb roads of France have been one of the most steady and potent contributions to the material development and marvelous financial elasticity of the country."

So much for the roads themselves. Let us now consider the best method of utilizing them so as to promote that access of producer to consumer

Citrus and Sub-Tropical Fruits

COMMERCIAL FERTILIZERS.

By Ben F. Thorpe, Covina.

THE subject of commercial fertilizers becomes one of more vital interest to the grower of oranges or lemons each year, as his trees are ever growing large and producing new branches, leaves and roots, as well as more fruit producing area that calls for more plant food.

As the soil territory on which the tree feeds is not increased in size, but remains the same as when the tree was first planted, it stands to reason that a larger application of fertilizer must be used. The soil that surrounds an orange tree in a grove planted the usual distance apart, of from 20 to 25 feet, is sufficiently rich in most citrus localities in California, to grow a good tree, and perhaps, for the first few years of bearing, to produce a fair crop of fruit on the trees, without the addition of any fertilizer. But, how about the future years? Would a man think of providing a five years supply of food for his family, and then stop feeding them? No, he must keep on providing more, and usually, better food as they grew older. So it must be with our orange and lemon orchards. They must continually be fed, if we wish to reap harvests from them. We attend the farmers institutes and clubs, and visit the demonstration trains which the state sends out, and are ever interested in the subject of fertilizers, and the more we listen, study, and investigate, the more evident it becomes to us, that each man must solve the problem of fertilizing his own orchard, which has just as much an individuality, as the owner, and what might be good fertilizing for one orchard, might not apply to our own. The soils are so entirely different in California that each ten acre grove should have its own needs carefully investigated and studied before spending much money for fertilizers. And even on a five or ten acre grove there may be different kinds of soil that would not respond to the same treatment.

One thing seems certain, and that is our soils are generally deficient in humus and nitrogen. Here is where the great value of barnyard manure comes in, for its principal fertilizing value is derived from these two factors. There is not much danger of using too much barnyard fertilizer, and if we could have but one fertilizer, this would be unquestionably the best to use. However most of us, make but one application of barnyard manure a year, and this cannot be expected to supply enough nitrogen for the trees for the entire year. The orchardists who are making the most careful study of fertilizing, are not depending on one application of any fertilizer, and especially commercial, a year, but are making several applications of smaller amounts during the year. These same orchardists are also following the plan of using the units, derived from using the different kinds of fertilizers to supply what they consider their trees need; at one time a certain amount of some kind of fertilizer to supply the phosphoric acid; again, one that will give potash when needed, and again one to furnish nitrogen. For nitrogen supplying, dried blood and nitrate of soda are both good, and both have their advocates. Finely ground steamed bone meal, and the different superphosphates for furnishing phosphorus to the tree, are the ones generally used for this chemical when needed.

As to the amount of fertilizer that a tree requires per year, it is another of those problems which the orchardist must determine for his own grove. On a twelve year old navel grove I am this year using thirty pounds of superphosphates per tree, in four applications during the year. On the same grove, I am using ten pounds of nitrate of soda per tree, in seven applications, the first being three pounds per tree in March at the time of blooming, two pounds per tree in May, and one pound per tree each following month. In this way, I think I am giving my trees a steady supply of plant food during the growing period, using cover crops in winter.

There are of course fertilizers that could be used to good advantage in many localities, other than those supplying the chemicals I have mentioned. Many localities have an acid soil that would be improved by an application of some form of calcium or lime, in the shape of gypsum or land plaster, or air slacked lime, and in some instances the application of magnesia might correct some defects, or in certain localities, iron.

There are vast riches of chemical wealth in all our soils, but unfortunately many of them are in an insoluble form, and not available for plant food, but in time our agricultural scientists may discover a way to release some of them in an economical manner that will go a long way toward reducing the cost of fertilizing.

I have already written some articles in this magazine on the subject of cover crops as having value as fertilizing agents, and will not say anything further at this time, except to claim that I consider them of great help to an orchard, when properly used.

Let him who doubts the value of fertilizing, if there be such a one, try the following experiment; Take half of an orchard that has not been fertilized and give it a good heavy fertilizing, somewhat after the manner I have mentioned in this article, and then leave the other half without any fertilizing, and note comparisons. He will have an object lesson any way.

WATER VALLEY.

A subscriber at Corona sends an interesting account of a section in the Mojave Valley known as Water Valley. This valley has an altitude of about 2000 feet and an area of some 35 to 40 square miles. It is underlaid with abundant water at a depth of twelve to twenty feet. The Santa Fe runs through the center of the valley. Alfalfa, grain and even garden stuff have proved profitable. The market up to this time has been in the various mining towns adjacent, very good prices having been received. Some of the wells are pumping as much as 150 miner's inches. It is too cold for citrus fruits but nearly all others do well. The section lies about ten miles west of Barstow.

Orange growers will give greater attention to frost protection this year than ever before.

When writing advertisers, mention Cultivato

A HINT AND A COMPLAINT.

I have been glad to see several ways of ridding land of squirrels published in the Cultivator. Some time ago a friend here was telling me of a way he thought he would work. He fills up the holes with a hoe, pulling in the dirt and tamping it in as tight as possible with hoe handle, then pulling the lose dirt on top of hole. The idea is that the squirrel goes to dig out and only leaves himself room to reach the surface, and as he nears the surface, the loose dirt on top runs into the hole and he is smothered before he can get out. I did not think much of the plan when first told of it, but another neighbor who has land adjoining his told me he had made a success of it. I went to see the place today. He had heaped up probably one-half a bushel of dirt, not more, and there were lots of heaps on the place, hardly any of which were opened. At least nine out of ten were closed and they were all occupied with squirrels. What a lot of squirrels there were there as I have often seen them. There may still be some there, but there are very few signs of fresh work. Am going to try it myself on some land near me, having cleaned mine out by all means I could think of, but never found anything a real success except carbon bisulphide and irrigation. Am glad to see the distillate and gasoline methods described and will try them.

I should like to say that practice knocks out a great many theories. A friend here told me that he was going to put out apricots because they headed to the wind, and I have seen this statement in the Cultivator. There are apricots all over this colony and I have three varieties and none of them head to the wind. They do not even stand up to the wind as well as most other trees; even a walnut that is supposed to be very tender to the wind stands it as well or better than an apricot.

Also some of us went in for cover crops last winter and we are still working on them. I could have hauled manure three times over while getting rid of cover crop. One man hauled his off and I was advised to do that with mine. I expect I have injured my trees on account of it. It is a very risky proposition. I was told a chain would do it. Now a chain is simply a nuisance in a tangle. The only thing I could get to do anything with it at all was the rolling coulter, but it seems to me the larger the plow the better for this work. A small plow will not turn it under at all. I thought my cover crop was growing very slowly, but it got started and then I wished it would stop, and before I had done a day's work on it, wished I had never heard of cover crops. If you get up any more cover crop editions, warn people of the job they will have. I expect those who write and tell of turning under cover crops don't know what a real cover crops is. One neighbor with a chain was showing me how easy it was, but I said, "That is nothing you are turning under there," and he said, "That is as much as is turned under in Southern California for a cover crop." I had to plow a neighbor's orchard here after that and I turned under stuff more than twice as much as he had, easily, but when I came to my own it had got so strong and tangled up and there was so much of it I could not cover it up, and this made it impossible to do anything with the place. I could not get water on it on account of the mess, could not furrow it out, cultivate it or do anything with it. One of my neighbors is now disking his for the second time and I don't know how much plowing he has done on it. One neighbor told me after trying to cover up a crop for another, that he wouldn't try to get his under at all. He would hoe round the trees and let it go, but one and all want no more cover crops. I don't know when I'll ever get mine in shape. My orchard has taken up so much time I could not get in other crops as I had intended and with it all, it is now in a mess indeed, and it has put me in a bad hole. I am three months behind with my work. I expected to have had everything cleaned up and the land all in shape before the first of April and ready to put in corn by that time. —Fred Gardiner, Greenfield, Monterey county.

* * *

The hint regarding squirrel extermination may be good. Certainly, it would leave the land in good condition, but we imagine it would mean considerably more work than poisoning and probably more than the bisulphide or distillate treatments. If it eradicates the pest, that is the question, however.

Regarding Mr. Gardiner's complaint as to plowing under cover crop, will say that we have personally had experience along that line and found no difficulty in forcing under rye as tall as five feet, and covering almost completely. The ground was plowed some eight or ten inches deep and chain was used of just the right length to escape the falling dirt as it was thrown over. In addition, a long wire was attached to the chain so as to drag back underneath the furrow. This helped to pull it out tighter and the tallest and toughest rye was forced down into the bottom of the furrow, and the dirt falling on top left scarcely a straw projecting. Some prefer to crush down the green manure crop and then disk so as to cut it into short particles, later plowing. We feel that the trouble with our correspondent and his neighbors is that they have allowed the plowing to go until the ground became too hard. If that is the case, they have an all-summer job. Green manure crops must be handled right or there is trouble. When properly plowed under, results are most satisfactory compensation.

IRRIGATION INVESTIGATIONS.

The U. S. Department of Agriculture, through the Irrigation Investigations, has just issued a bulletin on the use of windmills in irrigation, by P. E. Fuller. It deals with the practical phases of the utilization of wind power in securing water for irrigation, describing in detail the methods to follow in choosing a location for a well, sources of water supply, wells, mills, pumps, towers, and reservoirs. It also gives cost of maintenance and crops suitable to be grown under windmill irrigation.

The information contained in this bulletin was prepared for the purpose of assisting settlers in developing and utilizing small water supplies. It is known as Farmers' Bulletin No. 394, and may be had free of charge upon application to U. S. Irrigation Investigations, Berkeley, Cal., or to any representative in Congress.

COUNTY HORTICULTURAL COMMISSIONERS.

SINCE the enactment of the present horticultural law thirty-five counties have fallen into line and appointed one commissioner to enforce the law and guide in the fight on the pests of agriculture. We say agriculture because the term Horticultural Commission is to a certain extent misleading. These commissioners, have the general interests of farming at heart as much as those of fruit growing.

It will be noted in the following list sent us by State Commissioner Jeffrey that four counties have appointed deputies. It is to be hoped that the other 22 counties will soon be in line with a working commission.

List of County Horticultural Commissioners appointed under new law July 21, 1910.

PEERLESS IRON WORKS, 126 O Street Sacramento, Cal.

FROM THE GROWER'S VIEWPOINT.

By Statistician Geo. Robertson.

THE raisin situation does not seem to be in a very satisfactory position from a farmer's point of view the world over, prices so far having been decidedly unsatisfactory.

The quantity actually exported from Spain during the last five years is as follows:

Year.	Hundredweight of 112 lbs.
1905	567,987
1906	323,685
1907	523,283
1908	520,370
1909	490,558

During the season of 1909-10 up to May 4th this year the quantity exported amounts to 465,580 hundredweight. Of this 389,983 hundredweight was shipped from Denia, 26,718 from Valencia, and the balance from other ports.

In spite of the growers having lowered their prices, shippers are inactive on account of the poor demand from foreign markets, which are overstocked. Thus low prices have prevailed. There is some demand, however, for distillery purposes.

The condition of the vineyards has improved with the last rains, but there has not yet been sufficient to counteract the previous drought.

The latest advices from Denia, dated June 17th, just received, state that the new season's crop is expected to be about the same as last year.

Sultanas.

Reports from Smyrna state that trade in Sultanas is depressed. Owing to the yearly extension of vineyards in the Smyrna district the average crop is now estimated at 60,000 tons. The 1908-9 season yielded about 55,000 tons, of which 52,000 have been exported to Europe, America and Australia, the remaining 3000 tons having been stored up in the country for lack of buyers. The new season's crop is estimated at about 50,000 tons. The heavy stocks of old fruit especially in England, and the general depressed condition of the trade have caused low prices. The local consumption is insignificant.

Figs.

On the other hand the Smyrna fig crop is all sold. The average crop amounts to about 25,000 tons, and this quantity was exported during the 1908-9 season.

The 1909-10 crop amounted to about 22,000 tons, and prices ruled high, and at the end of March this year, not a fig can be found in Smyrna, or in the interior.

Almonds.

The Spanish market for almonds at Alicante is quiet, growers being reluctant to sell, awaiting to get higher prices because stocks are short, and the coming crop will be smaller than that of last year owing to the long continued drought, and also to the late frost.

The greater part of the 1909 crop was damaged by rain during the most critical drying period. The average price of the season to growers barely reached 14 pesetas (about $2.52 per hundred weight of 112 pounds) for un-graded raisins delivered at the packing houses. This price leaves the grower with a deficit of at least 3 pesetas, or 52 cents per hundredweight, on the actual cost of production. In consequence of these low prices where irrigation is available, Muscat vines are being uprooted, and the ground converted into general agriculture, while in dry and semiarid conditions growers are extending the planting of almond trees among raisin vines, with a view of replacing the latter by almonds, now regarded as the most promising crop as a substitute.

GREAT RETURNS FROM APPLES.

Pomona Ranch, including 100 acres of bearing apple orchard, in the Touchet Valley in southeastern Washington, has been sold by J. L. Dumas of Dayton, former president of the Washington State Horticultural Association to Dr. C. F. Schlitz of Wenatchee, Wash., formerly of Canton, O., and L. M. Vannice and E. S. Hubbard of Dayton, for $150,000. In addition to the bearing orchard the sale covers 140 acres of land, 30 acres of which is in young trees. The fruit ranch eventually will cover 200 acres.

The crop, estimated at 75,000 bushels, goes to the buyers, who are thoroughly familiar with the country. Dr. Schlitz came to eastern Washington from Ohio, five years ago, since which time he has studied scientific methods of orcharding and the details of managing a commercial ranch; Mr. Vannice has had 36 years' experience as a farmer in Columbia county, retiring four years ago, and Mr. Hubbard, a native of Washington has farmed in the southeastern part of the state all his life. They have made several entries in the carload class at the Third National Apple Show in Spokane, November 14 to 19.

Pomona Ranch came into national prominence four years ago, when it produced its first big crop. The gross receipts exceeded $100,000 during the three succeeding years. Apples grown there commanded the highest price in the Liverpool markets; the value of prizes won at the National Apple Show in Spokane in 1908 exceeded that of any individual exhibitor, and these, with other achievements, have made Pomona and its owner famous. Pomona Ranch is the pioneer commercial orchard of the valley and forerunner of an industry which is rapidly eclipsing all others except grain farming in that part of the country.—August Wolf.

FOR THE CODLING MOTH.

Prof. C. P. Gillette, of the Colorado Agricultural College, has discovered a new insecticide for the codling moth, which has proved effective in destroying the worms, and probably will be found not so injurious to apple trees as other arsenical poisons. Sulphide of arsenic is the name of the new poison. It comes cheaper than the arsenics now in use.

The Willamette Valley Apple Growers Association has petitioned the legislature for an appropriation to be used in investigating horticultural troubles, especially fungous growths.

IN "OFF YEARS."

It pays to care for well located orchards in off years when the crop is a total or partial failure. The care the trees receive this summer will help to determine the number and vitality of the fruit buds which will be formed this season for next year's crop. Watch the trees carefully during the summer. The scab fungus and some other diseases which ordinarily do so much damage to the fruit, work also on the leaves. Spraying with Bordeaux mixture is very helpful in keeping these diseases in check, thus protecting the foliage and providing favorable conditions for a good crop next year, even though this year's crop may be light. Watch for leaf eating insects also, and if any are present, add two pounds of arsenate of lead or six ounces of Paris green to every 50 gallons of Bordeaux and spray thoroughly.

NUTS RICH FOOD.

The edible portion of nuts, with few exceptions, is very concentrated food, containing little water and much fat. In general, nuts are also rich in protein. Those ranking high in this nutrient, the pignolia, a variety of pinenut imported from Spain, with 33.9 per cent, the peanut with 29.8 per cent, and the butternut with 27.9 per cent protein, surpass most ordinary animal or vegetable foods in this respect. The almond, beechnut, and pistachio, with 21.4 per cent, 21.8 per cent, and 22.6 per cent respectively, compare favorably with dried legumes. The Brazil nut contains 17.4 per cent protein, the filbert 16.5 per cent, the walnut 18.2 per cent, the hickory nut 15.4 per cent, the pinenut 14.8 per cent, the pecan 12.1 per cent, and the dry chestnut but 10.7 per cent. The dry acorn, fresh chestnut ,and cocoanut, with, respectively, 6.4, 6.4, and 6.6 per cent, are not as rich in protein as bread.

We have been importing millions of dollars worth of nuts and nut products every year, but this country has now established at Cornell University, perhaps the first course in nut culture in the world, and it is probable that the "millions of dollars worth" will soon figure on the export side instead of the import side. For the course in nuciculture at Cornell, there is an annual prize of twenty-five dollars for the best grafter.

Through the center of France, from the Bay of Biscay to Switzerland, there are large plantations of chestnut trees. The nuts are large and during the fall and winter the poor often make two meals a day on steamed chestnuts, eaten with salt or milk. Physicians say they are wholesome, healthy, nutritious and fattening.

The ninth annual Convention of the National Nut Growers Association will be held in Monticello, Florida, November First, Second and Third, 1910.

California peaches have had some competition in Eastern markets with Georgia and Texas fruit, but the higher quality of California fruit gives it the advantage.

The Kings county horticultural commissioner reports: "Many of our orchards and vineyards are not as free from weeds as we would like to see them."

Plows

Don't you need a new plow? Now is the time to buy. When you are considering the matter, remember that a name does not sell poor plows, but good plows have made one name famous.

The name "DEERE" on a plow fixes the quality and has done so for half a century.

Backed by 70 years of experience, the John Deere plows are the best that brains and skill can produce—the most satisfactory to the user in every way—more of them sold than of any other three makes.

The John Deere plow is the lightest draft plow in the world. Save your horses by buying Deere plows.

Made in every style—from small walking plows to the big engine gangs.

Get ready for your plowing now. Write for catalogue today.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

SOMETHING FROM NOTHING.

By Mrs. Minna E. Sherman.

THE old saying of Barnum's that the American people like to be fooled, has been twisted entirely out of its real meaning until it now stands for the untruthful statement that the people like to be duped. The fooling they enjoyed was that of "cherry colored cats." We are a joke loving people—even the staid Cultivator has been giving us lately that ever laughable story of the Jumping Frog. That is our form of being fooled, something with an innocent jest in it.

Oleomargarine.

The oleo people have played with us until the mass of the people are no longer ready to use the little color tubes to make the white stuff look like butter when served. White butter is not appealing to the eye and offends the palate. The only plea offerred that seemed to bring sympathy was that the dairymen were combining to rob the cotton planter of a part of his earnings, when cottonseed oil was not good enough for butter imitation. The foolishness of that plea became evident, when, before the Congressional Committee the fact was brought out that all the cottonseed oil used was too litle to be considered a factor in the case, five to ten per cent being all that was in the finished product. The fact was that cottonseed oil was too high priced for this use. The whole fight then lies in making something that can be used as an imitation of butter and passed off in boarding places as butter.

Water.

In butter stretching the creamery people took a hand as well, but this was when the butter wars were raging and the butter maker that could make the most butter from a given amount of cream, or rather of butter fat, was the man to secure the job. The creamery men caught on from the dairy men to the fact that butter could be increased by addition of water at proper temperature. The early records of wonderful amounts of butter fat given by cows when the cream was churned, fell down before the Babcock test. The cows that went up to the Chicago World's Fair with big churn records were cut down in their performance woefully. Churn tests often overran in butter the actual fat test as high as thirty-five to forty per cent, if the butter was instantly worked. This was a bit of foolishness that has a sporting element that makes it more forgivable than some other sins against truth. The creamery men studied out how this was done and a few years ago, much of the butter ran twenty to twenty-five per cent over the fat test. I saw one instance reported in the newspapers where it was said thirty-two was found as an overrun. This I think doubtful, as the butter would be quite hard to carry to market if that much floated. The state laws now fix the amount of water in butter and a number of arrests, and heavy fines as high as $500 have broken up this practice.

Churning.

When the butter is in the granular form about the size of wheat grains after the buttermilk is drained off, instead of dashing on cold washing water to float out the buttermilk remaining, warm water is dashed on, then the salt. The churn is rocked a few times and the mass gathered up, put into the butter forms and as soon as possible, cut and put into the parchment paper. When cloth was used the extra water was often lost but the use of parchment paper kept in the water, as well as it kept out the air. The one thing that has had more patents issued on it than any thing else in the Patent Office at Washington is the churn. The simple matter that the butter is forced out by mechanical action from cream that is ripened properly and at the right temperature is overlooked and the blame for long churning is placed on the churn. More foolishness again.

Merger.

Every little while the old idea of merging or increasing the butter comes out. At one time it was Black Pepsin that was sold for forty or fifty cents a pound—a harmless lot of stuff mostly baking soda worth ten cents a pound. It might as well have been sand, for a tablespoonful was used and the hot water used to mix it with the finished butter made it into a slushy compound holding the water. Just now we have a machine offered for sale, that by adding a pint of four cent milk to a pound of butter will make two pounds of butter. The machine for doing this is sold for two or three dollars and that is where the profit is. Now if you wish to add a pint of milk to a pound of butter, do so by all means. Right in the kitchen is the egg beater, or the cake mixer, or the bread maker. Now take any one of these and take the pound of butter, cut it up, put on the pint of warm milk and turn the crank until you have the mass mixed. Set it away to harden.

Foolishness Again.

Now what have you? That much less butter fat in the mass. Take the cake that has always been successful and delicious. Make it, using a measured cup of this butter and see if the cake is not less rich! Try the same amount of butter served to each person on the table and see how many calls there come for more butter! In other words this is merely a form of wind pudding. The labor

349 Pacific Electric Building Los Angeles, California

is lost, because the butter fat has not been increased but merely stretched out a little in quantity. This reminds me of the stories that prevailed a few years ago in the magazines devoted to destroying the common sense of women. Really I always feel insulted over journals that are made of milk and water for women's reading. These tales were something like this. "I had nothing in the house, company came, I took three potatoes, two eggs, a stale buscuit and put them together and made a dinner for six. Do not believe it for it is foolishness to look for something out of nothing!—M. E. Sherman.

PELLAGRA IN THE HORSE.

The story of pellagra, by Marion Hamilton Carter, in McClure's Magazine, has caused the American people to sit up and take notice. The following quotation, like Lincoln's rat hole in the corner, will bear looking into:

"The hope of the American situation lies in the Pure Food law and the horse. At the first pellagra conference, Doctor Powers pointed out that pellagra and 'blind staggers' in horses are probably one and the same, and Doctor Wood suggested that we may actually have at hand all the ready-made serum that we need."

Space will not permit of a general discussion of the subject, but here are a few pertinent facts in connection with this comparatively new and unexplored field of scientific research. For many years, at least, corn has been considered a dangerous food for the horse. It has killed many times more horses from colic than all other foods combined. Again, there is a disease in cattle known as "corn stalk disease," which, like pellagra, has defied every effort to determine its cause. This is a disease of cattle and attacks them only during the winter months when they have fed on corn stalks in the fields.

Now, on the other side of the proposition, we must note this: The blind staggers of the horse from eating corn is in no way different from that produced from any other food, save in its frequency and severity of attack. The symptoms are not those characteristic of toxemia and certainly have no resemblance to the symptoms described as being peculiar to the nervous type of pellagra. It is difficult to see how this condition of the horse can be considered in any other light than a flatulent colic with more or less reflex brain disturbance. Pellagra is essentially a chronic condition; while blind staggers is always acute, and if death does not take place within two or three days, the animal goes on to complete recovery. This condition of the horse is not always associated with the feeding of corn that has been heated or handled in such a way as to make the presence of toxic substances probable. It certainly requires an extreme and unwarranted stretch of the imagination to see any relation of blind staggers to pellagra.

There is a condition of poisoning from eating mouldy corn stalks that in the horse is just a little more worthy of consideration in this connection. But even here there is never a chronic condition following with special skin, intestinal, or nervous symptoms.

We are unable to discover at the time upon what grounds the author of the article in "McClure's Magazine," or Doctor Wood assumed that the horse is subject to pellagra.—Geo. H. Glover, Colorado Agricultural College.

Auction

100 head of live stock, 300 chickens, machinery and implements, on my ranch, four miles northwest of Garden Grove, one-half mile north of Cordorniz Station, and five miles southwest of **ANAHEIM.** Take Santa Ana cars to Cordorniz Station. Teams in waiting.

Thursday, Aug. 4th, at 10 a. m. sharp.

Forty head of fine dairy cows, Jerseys, Holsteins and Durhams, all young and in fine condition, fresh and coming fresh, large, rich milkers, in fact one of the very best herds of dairy and family cows in this locality. Twelve head of fine yearling heifers, one thoroughbred Durham bull, 2½ years old; one Jersey-Holstein bull, 15 months old; four head of good work horses, weight about 1400 lbs. each, all first-class stock; one team of work mares, weight about 1050 each; good all-purpose team; five brood sows, twenty-six head of fine shoats, nineteen head of pigs, one thoroughbred Duroc-Jersey boar, 300 laying hens, all last year's fowls, White and Brown Leghorns, Plymouth Rocks and Rhode Island Reds.

Implements: Two plows, two harrows, one cultivator, mower, rake, De Laval cream separator, ½-H. P. motor, 2-H. P. boiler, 500-lb. milk tank, pails, cans, two 600-lb. Fairbanks scales, alfalfa seeder, etc., etc.

Owner is retiring from the business, having leased the ranch, and everything positively must and will be sold to the highest bidder on the above date. No limit or reserve. Do not miss this genuine closing out sale. Free lunch at noon. Terms spot cash.

JOSEPH M. C. HILL, owner.

WHY CREAM TESTS VARY.

Variation in tests has caused much dissatisfaction in the selling of cream. When the cream is from the same cows, which have been fed the same ration and milked by the same man, and when the same separator is used, the farmer naturally thinks the per cent of fat in the cream should remain the same.

Errors are often made in making tests, especially in taking the sample, but variations constantly occur that are due to other causes. The most common causes of these variations, as pointed out in a circular, No. 37, by Prof. C. H. Eckles, of the Missouri Agricultural Experiment Station, Columbia, Mo., are as follows:

1. Variations in the speed of the separator.
2. Variation in temperature of milk separated.
3. Rate the milk flows into the machine.
4. Amount of water or skim milk used in flushing out the bowl.
5. Change in the richness of the milk separated.
6. Adjustment of the cream screw.

Change in the speed of the separator is the most common cause of variation. The greater the speed of the separator, the smaller the amount of cream and the higher the per cent of fat.

Again, the temperature of the milk separated varies on the farm from day to day. If cream tests 30 per cent when the milk is separated at 90 degrees, it may test as high as 40 per cent when separated at 70 degrees. Under average conditions on the farm, however, the variation in fat due to change of temperature will not amount to more then 3 or 4 per cent.

A third cause of variation is found in the rate at which the milk flows into the machine. If less than the regular quantity flows into the bowl, the tendency is to increase the per cent of fat in the cream.

The richness of the milk separated affects the richness, but not the quantity of cream. The richness of a cow's milk depends on inheritance and can not be changed permanently by feed.

Small variations are likely to occur from the other causes suggested by Prof. Eckles. By the use of an ordinary Babcock testing machine and by measuring the sample of cream into the test bottle with the same pipette as is used for measuring milk, any farmer can make a test of his cream that will satisfy him as to the accuracy of the test he receives from the cream buyer.

METHOD OF DOCKING SHEEP.

Methods employed in cutting the tails from sheep in the division of Animal Husbandry at University Farm, St. Paul, are, first to place the lamb on its back, pushing the skin on the tail back towards the body as far as possible so that enough skin will remain to cover the stump of the bone when the tail is cut off. In operating on lambs several months old draw the skin back closely to the body and tie a ligature tightly around the stub of the tail until an hour or two afterward to prevent excessive bleeding. Place the lambs in a clean pen bedded with clean straw. Cleanliness prevents infection, and in such an enclosure bleeding can be detected. Rams should be castrated at time of docking, while in the hands of the operator, if proper physical development of the organs has been reached. This condition occurs about ten days after birth.

The Farmers Union of Walla Walla, Washington, has won in its suit with telephone company which proposed to increase rates. The farmers are securing their phones at $6.00 per year.

A Porterville man succeeded in killing a mountain lion last week.

The Ornamental Garden

LAWN PLANTING.

THERE is nothing more charming than a well-designed house surrounded by artistically treated grounds; and of the essential features of home grounds none is so important as a beautiful lawn—the rich, velvety turf of the smooth, well-kept lawn, varying in tones of green with the play of sunlight and cloud shadows, being the heart and life of all.

"The Tropics may have their delights, but they have not the turf, and the world without turf is a dreary desert. The Teutonic races all love turf; they emigrate in the line of its growth."—Charles Dudley Warner.

A perfect and enduring lawn, one of luxuriant richness with closely interwoven, firm, deep and elastic turf, is only created by sowing a composition of the various kinds of grass seeds suited to the conditions and the climate. Several varieties are needed, that the lawn may be verdure-clad during all seasons, and the seeds must be sown liberally (at the rate of from four to six bushels per acre), not only that a lawn may be produced quickly, but because the kinds of grasses suitable for perfect lawns are fine-leaved and should take entire possession of the ground promptly, thus checking the development of weeds, the seeds of which are in all soils. The coarse pasture and hummock-forming grasses will not produce a fine lawn. Good, rich, deeply worked soil, either of a friable texture or else under-drained, is as necessary for the production of a perfect lawn as for garden crops, although most grasses, being accommodating plants, if they do not get the requisites for best results, will do their best with what is supplied them. Early and frequent mowing and rolling, as well as the liberal application of water through a lawn sprinkler during dry seasons, is one of the secrets of maintaining beautiful green turf.

We not infrequently see, after a dwelling costing five, ten, twenty or thirty thousand dollars is erected, that the grounds surrounding it are left to the tender mercy of some ignorant pretender to grade and put in shape. The educated, intelligent architect's duties in many cases end with the completion of the building, and the "garden architect" is installed to grade for the lawn; and a common consequence is that the beauty of the place may be forever marred, for this matter really in many cases requires as much intelligence and good judgment as the construction of the dwelling itself. One of the first conditions for a perfect lawn is that the land be perfectly drained, either naturally or artificially; if the subsoil is sand or gravel, so that water can quickly pass through it, then there will be no need for artificial drains, but if there is a stratum of adhesive clay for a subsoil, then drains are indispensable every fifteen or twenty feet. As the formation of the lawn is the foundation of all subsequent operations, it is imperative that it be carefully done; for if badly done at first it cannot be changed or altered, unless to the great detriment of trees or shrubs that have been planted or flower beds or walks that have been laid out.

The first thing to be done is to get the ground shaped to the desired grade, taking care in grading that when hills or rocks are removed, sufficient subsoil is also removed to be replaced with top soil, so that at least five inches of good soil will overlay the whole in all places; and where trees are to be planted there should be twice that depth of good soil. When the grading is finished, if the nature of the ground requires it, drains should be laid wherever necessary; then the whole should be thoroughly spaded or plowed.

Seeding.

Sow seed early in morning or on a very still day when an even distribution may be secured. Rake in very lightly and roll. Sow at the rate of a pound to 250 square feet. Blue grass is usually preferred in California though some use mixtures, especially a sprinkling of white clover.

Terraces and Slopes.

On sloping banks it is often necessary to use sod, as the rains wash the soil off before the grass seed has time to germinate. It is sometimes even necessary, in sodding very steep banks, to use pins eight or ten inches in length to pin the sods in place, to prevent them from being washed down by excessive rains before the grass roots have had time to fasten in the soil. In small yards sodding is often done so as to get immediate results; but in all such cases great care should be taken to see that the sods used are of the proper quality, otherwise it is much better to wait a few weeks for the lawn seed to produce the lawn. If the slope is not too steep, sowing thickly then covering with burlap sacks till the seed begins to prick through is a satisfactory way.

Fertilizing.

The question of fertilizers for the lawn is an important one. If the soil is naturally a deep, rich loam, it is not indispensable that manure be used the first season of sowing, although in every case it would be an advantage, and is really essential if the soil is poor or light. Perhaps the best way to apply well-rotted manure is to spread it thick enough to cover the ground after plowing or digging, and then harrow or rake it in; though a little more costly, the best plan to insure permanency for the lawn is to use from 2,500 to 3,000 pounds per acre of coarse ground bone.

When the land has not been fertilized before sowing, it is necessary to use some top-dressing of manure each season to keep up the fertility of the lawn, and nothing is better for this purpose than to spread over it late in the fall well-rotted short stable manure enough to partially cover the surface. On no account should fresh stable manure be used, or the lawn will be very apt to be ruined by the introduction of weed seeds. This should be allowed to remain on until such time as the grass shows signs of starting in the spring when the rough portion should be raked off and a heavy roller applied, so that the surface of the lawn be rendered smooth and firm for the mower. If the top-dressing of well-rotted manure has been omitted in the fall, fine bone dust mixed with finely sifted wood ashes, in equal parts, may be sown on the lawn and we advise that the lawn be rolled about as thick as sand is usually strewn on the floor, and rolled down, several times during the spring.

Small Fruits and Vegetables

DESIRABLE GOOSEBERRIES.

MANY parts of California are not suited to gooseberries, but in other sections they are a profitable crop. To readers in such sections there will be interest in the following, written by W. S. Thornber, horticulturist, State College of Washington for Portland Oregonian:

The gooseberry, unlike most American fruits, is sorely neglected here in the West, even though very attractive financial returns have been realized from this crop. Two causes are apparent for this neglect—one, the difficulty of picking the fruit, and the other the almost universal but erroneous belief that gooseberries are good only when used in their green state. Rarely if ever do we see ripe gooseberries upon the market, yet there is no better fruit for canning, spicing and preserving than our large, rich gooseberries.

Both the English and American sorts do well in most sections, but in a few places gooseberry mildew does some damage to some of the English sorts; yet it can be successfully controlled by thorough spraying at the proper time. Spray with sulphur-lime just before the buds open.

With reference to varieties, the European ones are the Carman, Columbus, Crown Bob, Industry, Keepsake, Lancashire Lad and Portage. We will briefly mention the characteristics of each variety.

The Carman is a small, poor, unsatisfactory plant, with short, recumbent canes and a small amount of yellowish green foliage, which is nearly always seriously affected with both anthracnose and gooseberry mildew. It is a light yielder of medium-sized, yellow-colored, poorly developed fruit, ripening about August 1. It is not desirable.

The Columbus is a small, bushy plant with short, stubby, poorly-grown canes and a fair amount of badly diseased foliage. The tips of the canes, the leaves and the berries are all more or less covered with mildew. The berries are very uneven in size, varying from very large to small, are of a greenish color and have thick, firm skins. The plants are only fairly productive.

The Crown Bob is a poor, unsatisfactory plant with short, slender canes, and a small amount of badly diseased foliage. Both anthracnose and mildew seriously affect them and both are moderately productive, ripening the fruit about July 15. The berries are large to very large, oblong in shape, of a deep, red color, thin, tough skin, and are almost covered with stiff, hair-like bristles. The size and quality of this berry is very popular in most markets.

The Industry is a large, thrifty plant, with good, strong canes and an abundance of dark green, healthy foliage entirely free from anthracnose and rarely or never affected with mildew. The plants are very productive and the fruit ripens about the middle of July each year. The berries are very large, uniform in size and color and have thick, tender skins and a rich, sweet flavor. The size, color and quality of the berries and the productiveness of the plants easily make this the best European sort tested. It is valuable for home as well as market purposes.

The Keepsake plants are poor, small and unsatisfactory with short, thick canes and a small amount of light green, badly diseasel foliage. Both the mildew and anthracnose seriously attack the foliage, and the mildew practically ruins the fruit. The plants are fairly productive, but the fruit is very uneven in size and development, making a very unsatisfactory variety.

The Lancashire Lad has a medium-sized plant with short, stiff erect canes and a fair amount of dark green, practically healthy foliage. The plants are moderately productive, but the fruit is always more or less injured by the mildew, thus making it unsaleable. The berries are variable in size, have a thick, heavy, dark red skin and are of fair quality, ripening about the 15th of July. It is not desirable.

The Portage is a medium-sized, open, spreading plant with good, short strong canes and an abundance of dark green, healthy foliage; the plants are very productive and the fruit ripens about the first of August. The berries are very large, even in size, of a light green color, having thin, tender skins, and an excellent flavor. It is one of our best all around sorts for both home and market purposes.

Among the American varieties, the Carrie is a very hardy, large-spreading plant, with strong spreading canes, and an abundance of fine, dark green foliage entirely free from both mildew and anthracnose. The plants are very productive and the fruit is free from disease, ripening about the 23rd of July. The berries are medium sized and of a light, green color, thin, tender-skinned and of excellent flavor. This is a very valuable variety for unfavorable localities.

The Downing is a very strong, free-growing plant, with long, fine canes and an abundance of healthy, dark green foliage. The plants are very productive and the fruit is free from all kinds of disease. The berries are medium-sized, of a light green color, tender-skinned and have an excellent mild flavor. It is one of the most popular and most widely-grown varieties, and is valuable for both home and commercial purposes.

The Houghton is a very large, rank-growing, thrifty plant with long, slender, recumbent canes and an abundance of healthy, dark-green foliage. The plants are moderately productive, and the fruit ripens about the first of August. The berries are medium-sized, thin-skinned, of a clear, green color, and have an excellent brisk, acid flavor. It is one of our standard American sorts, but too small-fruited for general commercial planting.

The Josselyn (Red Jacket) is a large, strong-growing, spreading plant, with long, recumbent canes and an abundance of fine, healthy, dark green foliage. The plants are very productive, ripening their fruit about the first of August. The berries are medium-sized, of a light green color, and have a thin skin and a very mild, pleasant flavor. It is one of our best American sorts for home and commercial purposes.

The Fresno Republican reports dried peaches selling at 4¼ cents.

Heider Eveners

Handiest thing on the farm. Saves horses, lightens labor. 2, 3, 4, 5 and 6-horse eveners. The HEIDER 4-horse Evener works 4-horses abreast on gang, sulky or disc plow, one horse in furrow, three on land. Works free, no side draft, coupled short all horses pull equal and easy to attach. We make Clevises to attach our eveners to all plows. HEIDER 3-horse Wagon Evener for wagon, manure spreader, grain drill, or any other implement with pole. HEIDER Eveners have many advantages over other kinds. ASK YOUR DEALER for HEIDER Eveners, if he has none in stock accept no other. Write us for catalog and we will tell you where and how to get the best, strongest, most satisfactory Eveners made. We also make Wagon Doubletrees, Singletrees, Neck Yokes, etc.

GOOD ROADS INCREASE FARM EARNINGS, Cover.

UTILITY OF GOOD ROADS, 75.

CITRUS AND SUB-TROPICAL FRUITS.—Commercial Fertilizers; Water Valley; A Hint and a Complaint; Irrigation Investigations: 76, 77.

DECIDUOUS.—County Horticultural Commissioners; From the Grower's Viewpoint; Great Returns from Apples; Off Years; Nuts Rich Food: 78, 79.

LIVE STOCK AND DAIRY.—Something for Nothing; Pellagra in the Horse; Why Cream Tests Vary; Method of Docking Sheep: 80, 81.

ORNAMENTAL GARDEN.—Lawn Planting: 82.

SMALL FRUITS AND VEGETABLES.—Desirable Gooseberries: 83.

EDITORIAL.—Millions Annihilated by Forest Fires; Successful Co-operation; Well Said; Farmers' Institutes; Citrus Growers' Meeting; Getting Together: 84.

AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, The Coast: 85.

PROFIT IN THE POULTRY YARD.—Chicks That Teach Themselves to Roost; Rheumatism-Bumblefoot; Cannibalism; Care of Chicks; Gapes: 86, 87.

BEES AND THEIR CARE.—Honey Crop Conditions; Central California Bee Notes; Concerning Notices: 88.

GENERAL AGRICUTURE.—High Cost of Living: 89.

QUERIES AND REPLIES.—Bitter Cream; Dairy Questions; Grape Leaves Dropping; Knotweed; Snakes: 90.

VETERINARY.—Swelling in Head: 90.

HOUSEHOLD.—Mother Goose and the Price of Meat; Jelly and Jelly Making; Modern Business Training: 92, 93.

PRODUCE MARKETS.—Los Angeles Market, San Francisco Market, Deciduous Market; Citrus Market: 94, 95.

Successful Co-operation.

The result of the first year's work of the Ventura bean men is the perfecting of a stronger and better organization for the coming year. The board of directors has been enlarged as to scope of country covered, and Orange county, Los Angeles county, and Ventura county, will all be represented now in the membership. It has been decided to have but one pool this year as against three last. The same manager will continue at the head of the organization.

Millions Annihilated by Forest Fires.

The awfulness of the fires which have been devastating Idaho, Montana, Oregon, Washington and portions of British Columbia, during the past three months, cannot be appreciated by those out of touch with the situation. The fires extend over hundreds of miles, and for other hundreds of miles the choking, sickening smoke has made life almost unbearable. Touching upon this great disaster and its lessons, the Spokesman Review of Spokane gives the following editorial:

"Fire is a good servant, but a bad master.

"The forest fire illuminates the platitude with terrible light.

"For three months already the lurid flames of burning forests, farms and homes destroyed, human beings and animals cremated alive, the soil itself consumed in places and wealth to the amount of millions annihilated, have darkened the timberlands of the country.

"If any argument were needed in behalf of conservation of natural resources, it would be supplied by the appalling losses caused by these fires. They also form an additional proof of the value of the federal forest service and of national conservation, for the mischief is not confined to the limits of a state or of several states, but affects the resources and waterpower of the whole nation.

"The drouth renders it incumbent on every one to exercise especial care when in the woods. The smoker should consider himself under special obligation not to let a single spark of living flame fall to the ground. The cigar, the pipe, the cigarette should all be dead before they are thrown away or emptied. The camper should soak the soil around his fire, as well as the fire itself with water. One spark, one dry leaf or twig and one breath of air to fan the tiny flame are all that are needed these days to start a forest fire.

"Make it a matter of personal pride no less than of civic responsibility to be a fire warden unofficially, and to prevent this needless destruction of private property and public resources."

Well Said.

An editorial, "The Ferment in the West," in the August Century judges Western conditions and Western ideas so correctly that we quote from it:

"The West does not like to be patronized. It resents that kind of well-being which is benevolently allowed it as an overflow of the profits of great capital. The theory of some in the East that legislation should be so molded and government, so conducted as to give the highest possible activity to big corporations, is treated only with scorn in the West. There they say that they would prefer less prosperity with more manliness and a truer equality before the law. They want the quickening impulse to come from themselves rather than have it thrust upon them from the outside, even by men who may be as wise as they are powerful. They wish no interference of Eastern corporations in Western state or municipal politics. It is, in a word, the defiant and swelling assertion of the right of the governed to have full voice in their government that is the dominant note in all this Western outcry. It is a revolt against privilege in legislation, whether national or local, and a determination to make an end of it."

Farmers Institutes.

Farmers institutes under the direction of the State Experiment Station, and conducted by J. B. Neff, will be held in Ventura county at Simi, August 18; Nordhoff, August 19, 20; Mound, August 24, 25; Fillmore, August 26; Santa Barbara county; Carpinteria, August 22; Goleta, August 23.

The Cultivator is given a private hunch that before many weeks there will be held in Los Angeles or some central Southern California point, a convention which will cover several days and before which there will be discussions of great importance to agriculturists. Definite arrangements are not completed and announcement will possibly not be made for a few weeks yet.

Getting Together.

The request of Secretary Tiede of the Orange County Dried Fruit Association in last week's Cultivator for information, should bring out a hearty response on the part of all holders of dried apricots. Of course there have been mistakes made by people insisting on big prices and refusing to sell until prices came up to their standard, but more often the mistake is the other way. Orange county growers, almost to a unit, are insisting on having their just proportion of the returns on dried cots. It is to be hoped this movement will not only be unanimous in Orange county, but that it will extend to various apricot growing sections. This will be greatly facilitated by giving to Secretary, A. C. Tiede, Santa Ana, the information he desires as to the output in different sections of the state.

Citrus Growers Meeting.

We have received from E. O. Essig, horticultural commissioner of Ventura county, notice for a meeting at Santa Paula next Saturday afternoon, July 30th, to look more thoroughly into the matter of fumigation. Regarding the meeting, Mr. Essig writes:

"It is absolutely necessary for every citrus fruit grower, sometime during the life of his orchard, to fumigate. Every year thousands of dollars are regularly expended by the growers of this county for this purpose. A great deal of the work done by fumigators is ineffective, unsatisfactory and unprofitable. In consideration of these facts, I deem it necessary that certain fundamental principles governing fumigation should be adopted and adhered to by all, so that more efficient work may be had by the growers."

Our live stock subscribers will note that Mrs. Sherman is again with us with one of her chatty articles, after an absence of a few weeks caused by illness. Mrs. Sherman is not entirely well, but we are glad to know is convalescing to the extent of being able to give her bright and cheery letters to Cultivator readers. Her great fund of information and readable way of presenting it make her writings more attractive than the average live stock matter. We hope Mrs. Sherman's health will permit of her regular work in the near future.

The Third National Good Roads Congress is meeting in Niagara Falls this week. It is expected that delegates from every state in the Union will be present at this conference. It is probable that representatives of the automobile and manufacturing interests will predominate, but the rural interests will also be a great factor in the discussions. The meeting is held in New York State in part because of the great interest manifested there in the subject of good roads and the recent appropriation of $50,000,000 for road construction work.

The "spell of weather" which was given to the inhabitants of the Pacific Coast last week has given them a taste for a few days of Eastern conditions for many weeks. For the first time in years California reports deaths from heat, that is excepting cases of exposure on the desert without water. Fortunately this condition where great humidity combines with intense heat seldom prevails.

We are informed that the Orange County Dried Fruit Association is winning in its fight for fair returns for this season's apricots, and contracts were made on Monday for cots at ten cents, which is the minimum of the association. Many of the members are holding for the full twelve cents and some predict that fifteen will yet be secured.

Irrigation of Orchards is the title of Farmers Bulletin 404 of the Department of Agriculture. It is written by Samuel Fortier, Chief of Irrigation Investigations, and contains many valuable suggestions on irrigation.

Pleasant surroundings and modern conveniences, easily obtainable, will go a long way in keeping the boys and girls on the farm.

Agricultural News Notes of the Pacific Coast

Northern California

It was warm.

The Sebastopol apple show will be held under canvas.

Shipments of early grapes have begun in Sutter county.

The new cannery at Suisun, Solano county, started last week.

Winters, Yolo county, is shipping nutmeg melons to the North.

Pomona Grange of Sonoma county met in Santa Rosa last week.

Nevada City, Nevada county, reports its big forest fire under control.

Some watermelon crops have been injured by the heat of the last few days.

Plumas county is extending its good roads to the mountain summer resorts.

Healdsburg, Sonoma county, has a new fruit packing and shipping house.

Oroville, Butte county, claims the biggest rock crusher in the United States.

Red spiders are doing much damage to hop fields in the Sacramento Valley.

The board of supervisors is giving financial aid to the apple show to be held in Sebastopol.

A pear grower at Ukiah, Mendocino county, is receiving $35 per ton for his Bartlett pears.

Rescue, Eldorado county, reports a new weed pest taking the fields and especially the roadsides.

Secretary Crane of the Oroville chamber of commerce is asking for fruit for exhibit purposes.

Evan Kelly has been made acting supervisor of the El Dorado forest reserve in Nevada county.

The University Farm at Davis has been short on water because of a breakdown of the pumping plant.

It is reported that Libby, McNeil & Libby will construct another milk condensing plant in Humboldt county.

The creamery located at Ukiah, Mendocino county, is proving profitable to the farmers. It is a home institution of which the people are proud.

The Western Pacific has put a train load of fruit from Sacramento into Salt Lake City in 35 hours and 45 minutes. The average time heretofore has been 72 hours.

The Advisory Committee of Sacramento county which with the County Board of Supervisors has had charge of road construction in that county, fears that too much oil has been used on some roads and that they will not be permanent.

The baghouse recently installed at the big smelter at Kennet, Shasta county, has proved insufficient to handle the smoke from four furnaces, and two furnaces are laid off until improvements can be made in the appliances.

Quite an industry has developed near Suisun in the shipping of tule hay to San Francisco. It is used largely in glass works and potteries for packing purposes. The price this year is $6.50 per ton, but it formerly sold at about $8.00.

Central California

It was warm.

The grain harvest of Kings county is well toward completion.

Turlock cannery opened on Tuscan cling peaches last Monday.

Santa Clara Valley hay crop promises to be exceptionally large.

Prices of Valencia oranges are very satisfactory to Tulare county growers.

Turlock is objecting to her cantaloupes going out in Imperial Valley wraps.

The San Jose Grange proposes to observe a Prune Day for the Santa Clara Valley.

Turlock reports melon prices up and down, varying from $8.00 to $16.00 per ton.

The veterinarian of Fresno county reports progress in the tick eradication campaign.

Monson, Tulare county, has sent 16 cars of melons to market. One grower netted $75 per acre.

Some growing oranges have been injured by lime-sulphur spray used on thrips in Tulare county orchards.

Apricot growers of the Santa Clara Valley are holding their dried fruit and refusing to accept offers of buyers.

Nearly 10,000 sacks of grain were purchased by one buyer from small producers in Porterville in one day last week.

Julge Venn of Fresno has been secured to put the ribbons on competitors in the next Santa Clara Valley poultry show.

The state veterinarian has discovered Texas fever tick on Hereford cattle recently shipped to Galt, Sacramento county.

The Stockton Cannery of the California Fruit Canners' Association began its season's run July 13th. It will employ about 400 hands.

Kerman, Fresno county, is having trouble on the water question, one party having been arrested and fined for tampering with canal headgates.

The board of directors of the Turlock and Modesto irrigation districts recently held a conference with congressmen and discussed matters pertaining to mountain reservoirs.

The raisin crop will be somewhat affected as to seedless and smaller varieties which were burned by the heat earlier in the season, but the muscats are promising fair crop.

At a recent meeting of the horticultural commissioner and his deputies at Visalia, Tulare county, report was made that great damage was being done to fruit, especially peaches, by squirrels.

It is estimated that the tonnage of dried apricots of this state will be 14,000 to 15,000 tons. The San Joaquin Valley growers are reported to have sold quite largely around the 8½ cent mark.

An expert of the Bureau of Entomology contradicts an early report that spraying for thrips had injured many young oranges by causing blistering. It is not yet determined what caused the trouble, other than sun heat.

Southern California

It was warm.

Shipping of grapes from the Coachella Valley has been closed.

San Marcos, San Diego county, is shipping great quantities of hay.

Persian varieties of grapes have been found to do well in the Coachella Valley.

Baldwin Park, Los Angeles county, has been shipping four cars of potatoes daily.

A test is being made to determine possibilities of by-products from cull cantaloupes.

Shipments of hay from Auld, Riverside county, are much lighter this year than last.

Escondido is making extensive preparations for observation of "Grape Day" on September 9th.

Petitions are being circulated in the Imperial Valley asking for the formation of an irrigation district.

Placentia will soon have under construction six new packing houses for handling the coming orange output.

Santa Barbara county is contemplating the establishment of ten free Library stations throughout country districts.

Oranges have been selling as high as $7.00 per box. Lemons are not so high as a month ago.

Many thunderstorms have occurred on the desert within the past two weeks, damage being done in some sections.

Forest fires in Lytle Creek Canyon, San Bernardino county, have caused much damage. They have been traced to careless hunters.

San Bernardino has a flowing well above the Lytle Creek Reservoir which is now producing in excess of 120 inches of water.

One of the newer varieties of watermelons known as the Angeleno is reported from the Coachella Valley as doing exceptionally well.

State Forester Homans made a trip of several days through the eucalyptus plantations near Escondido and Encinitas, San Diego county.

Escondido found its stock shipments so extensive on one day last week that a special train was required to move them to market.

Imperial Valley has tried the experiment of shipping melons loose in cars piled on straw which saved about $200 per car for crating. It proved fairly successful.

A number of orange growers at Rialto, San Bernardino county, have formed a co-operative packing and marketing organization, though it is reported it will be independent of the Exchange.

Filing has been made on 70,000 inches of the waters in the Hog Lake Canyon, San Jacinto mountains. The water is claimed for mining purposes and for the irrigation of the upper Hemet Valley.

Orange growers at Rialto, San Bernardino county, have formed a Protective Association which will look after the best interests of the orange groves with especial attention to protecting from inroads of insect pests.

The Coast

It was warm.

At a Jersey sale at Portland, Oregon, one heifer commanded $435.

Binders are just starting on their run in Lynn county, Washington.

The recent rains did extensive damage to curing alfalfa hay in Arizona.

Hop growers near Salem, Oregon, are generally spraying for the hop louse.

The Portland Fair will begin Monday September 5th and continue till the 10th.

A North Yakima hop grower has just sold his 80 acre hop yard for $75,000.

Dry land alfalfa at Wilson Creek, Washington, is yielding two tons per acre per cutting.

Large extensions of the rubber forests of Mindanao, P. I., are being made by planting.

The Roosevelt Dam in Arizona was the means of saving many crops in the Salt River Valley.

Wool sales of eastern Washington are much more satisfactory and moving with more rapidity.

The Colorado State Stock Growers' Association held its annual meeting at Grand Junction last week.

The rich delta lands along the Colorado south of Yuma, Arizona, have been purchased and will be subdivided.

Potato bugs are causing vast damage to farmers throughout Nez Perce Prairie and Clear Water Valley in Idaho.

Intensely hot weather combined with drouth causes great damage to grain growers and all farmers of eastern Washington.

The Beartooth National Forest in Montana is offering every possible aid to sheep men who are losing sheep because of the drouth.

The agricultural experiment station at Pullman, Washington, is making extensive experiments in feeding cows on green peas and oats.

The state experiment station has investigated the matter of grain smut at Palouse, Washington, and finds that smut blowing over the fields will spread the infection.

Northern Idaho and southwestern Montana have suffered under the greatest and most destructive forest fires in the history of the Northwest. Many people have lost their lives.

The Coconino National Forest of Arizona, will be divided into two reserves, one known under the former name and the other with headquarters at Williams known as Tusayan Reserve.

Owing to contention over the rating of Winesap apples at the Spokane Interstate Fair, also at the National Apple Show, apple growers at Wenatchee, Washington, refuse to make any exhibit at either show.

The Farmers Unions of the Inland Empire have united and formed a district which will maintain an agency at Walla Walla and sub-agencies in other towns of eastern Washington. The principal activity of the organization is the handling of wheat.

Coulson's
EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying power and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Get it at your dealer's; anyway send for our Catalog which tells about the familiar Coulson Products and gives valuable information about Poultry Raising.

LEE'S GOODS
Insure Success

Lee's Lice Killer sprayed on the roosts and walls of the house twice a month during warm weather will keep all lice off your hens.

Lee's Egg Maker fed regularly during the moulting season will do more to keep your hens vigorous than anything else you can use. Your hens will lay while moulting, get new feathers rapidly and the fertility of the eggs will allow you to hatch the chicks early in the fall.

Lee's Germozone used twice a week in the drinking water is a very valuable preventative of colds and other chicken troubles.

The Mandy Lee incubators and brooders are built on correct scientific principles, and both the egg and the chick get exactly the right conditions to produce very strong birds. Our machines are easy to handle, the directions for running are very complete, and they are not apt to get out of order. Write for catalog and any other information you want.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

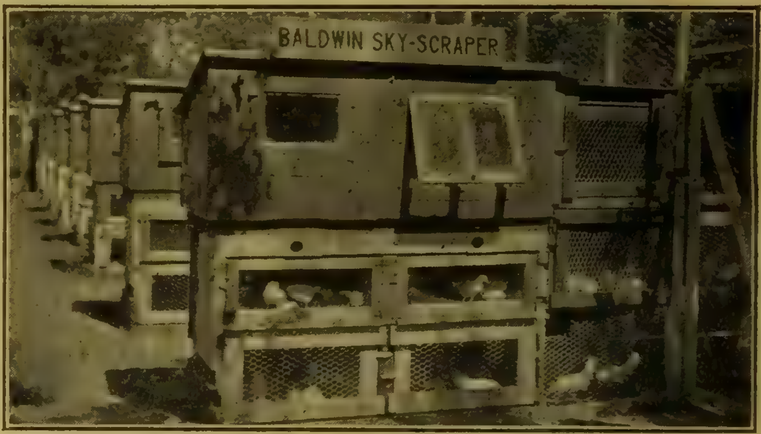
CHICKS THAT TEACH THEMSELVES TO ROOST.

By Frank E. Baldwin, San Jose.

OF the many perplexing problems to discourage the beginner in poultry raising it seems to me the question of teaching incubator chicks to roost, is one of first importance.

It took me some years to find out how to arrange things so the chicks will teach themselves to roost without injury to each other and without loss. During the time I was learning the scheme I lost a lot of chicks first and last by crowding and smothering, but now we never think of the roosting proposition except when asked for information.

So many ask me how I teach my chicks to roost and are so much interested in the fact that they teach themselves, that I will try and explain it here for the benefit of others.



My attention was first attracted to the fact that chicks from a week to ten days old were hopping up on top of the hover in the brooder and that they were inclined to remain there for a while and later would roost there all night. It occurred to me that a lath placed an inch higher and an inch and a half in front of said hover might encourage the chicks to try it for a roost. I found they would hop onto this lath roost, but would not stay long at first, but as they became accustomed to it would stay longer and soon roost there over night—that is a few of them would.

Then I put other roosts of lath each a little higher than the other and a little way apart, making steps easy for them to climb to encourage them to try. Little by little some would find their way from the bunch on the floor to the roosts till all were filled.

Referring to the cut, will say I use the Model Colony brooder with a six-foot extension, the front of which is one inch mesh wire. Under this commercial brooder I have constructed a secondary brooder of my own design, with lamp heater similar to the one in the upper brooder.

In the upper brooder the heat is confined to the left hand compartment or just one-half of the upper brooder, while in the secondary brooder the chicks have the whole length heated, giving them twice the room.

We sun the chicks for three or four weeks on the top floor and then put them down stairs where they remain as long as they need heat.

In the top brooder the roosts, three in number, run from left to right in the left hand compartment parallel with the roof and about six inches from said roof. In the secondary brooder the roosts also run from left to right the whole length of the brooder. The chicks many of which have learned to roost up stairs will go on the roosts down stairs to about one-fourth the total number the first night and then each night more will go up until the end of the second month when all will be roosting.

When the chicks first go down into the secondary brooder they are confined to that floor for a day to get them to feel at home, when they are left down an incline to the ground. After this they run up and down at will.

When the chicks are two months old they are driven into another yard through a small gate and into a small open front house with roosts eight inches from the ground with gunny sack over most of front in bad weather. Then they go to roost and we never look at them after driving them into the house the first night, as the roosting habit has been formed and most of them will roost the first night and the rest soon follow.

After driving chickens out we clean and spray the secondary brooder and bring down the chicks now three or four weeks old from the top floor, clean and spray the top brooder and put in another hatch from the incubators, thus having an up-to-date continuous performance.

The fact that no time or thought is given to teaching the chicks to roost makes it possible to take care of more chicks and saves a deal of nervous wear and tear.

POULTRY QUERIES.

Rheumatism—Bumblefoot.

One of our toms has swollen feet. He seems well in every other way. Please give remedy through the Cultivator.—A. L. S., Imperial.

This query has been mislaid, but as the symptoms are so meagerly given, it is rather difficult to suggest a remedy. If the feet were feverish and the bird seemed very lame, one would suspect rheumatism, and in that case a good liniment would be in order, while a purgative would be helpful to drive it out of the system. If it is bumblefoot and the swelling seems to contain pus, open the swelling and remove all the contents possible, then wash clean and dry, after which a dressing of camphor salve, as described in Cultivator of April

21st, should be freely rubbed in and the foot bandaged so no dirt could work in. It's a slow disease to cure, and the wound should be cleaned once each day and all pus and foreign matter removed, but if the bird is worth saving, it can be saved if one takes the time and trouble to do it.—Mrs. Frank Metcalf.

Cannibalism.

Have had trouble with cannibalism among my young Minorca chicks. Has any other reader had trouble that way? What can be done to stop it? What is the cause?—W. C. B.

Cannibalism among young chicks is caused by their natural desire to get into mischief as much as anything else, and the best way is to give them something to do to take their attention from each other's toes, etc. One way to help this, is to give them lots of litter to scratch in, and another good way is to hang up pieces of fresh meat, so they will have to jump for a bite of it. Suspend pieces of meat on strings and as it wobbles around, they will have all they want to do chasing it, and will usually let each other alone. The meat also attracts flies, which they try to catch, but it must not be allowed to hang until putrid, of course, but be replaced with fresh pieces every day. In a flock where 1000 were being raised, this vice became very troublesome, and the care-taker refused to use chaff, preferring sand floors, but the pieces of meat acted like a charm, and he had no further trouble after trying this treatment. A gopher cut into small pieces, is just as good as any other meat providing the gopher is caught in a trap or shot, not poisoned. A fresh head of lettuce may be suspended in like manner, but it seems the meat is what they crave, and is by far the best.—Mrs. Frank Metcalf.

Care of Chicks.

Just three weeks ago I bought forty incubator chicks. On the fifth day I fed them a small saucer of clabbered milk and did for two days following. Then I noticed slight bowel trouble in several, so of course stopped the milk. The next day three died and others have died sudenly since. I have fed nothing but chick food (with a little wheat mixed in this week) and they have had fresh water in clean dish before them always. At noon I give them lettuce. Their box always has fresh, clean straw at night. I have a fireless brooder for them. What can I do to save the rest?—Mrs. N. C. C., Los Angeles.

I am inclined to believe that the clabbered milk so upset their digestions that it caused a sort of chronic indigestion. Also the hot sun is very trying at this time of year. Had you opened the first ones to die, I believe you would have found a hard, cheesy substance which clogged the digestive tract, allowing nothing else to pass through, causing them to die from stoppage of the bowels, perhaps. Watery matter might have been evacuated all right, but nothing solid could have gone by, if my theory is the correst one. It is akin to cholera infantum, the principal cause of that being sour milk which curdles into a hard cheese stopping the intestinal tract. For the rest, be sure that they have plenty of grit or very coarse sand. Then give each one a dose of Epsom salts which is best done by putting a teaspoonful into a pint of water, and giving them no other drink. Then toast bread until charred, and soak it in limewater. Mix a raw egg with wheat bran and add for their chief feed until they are better. I hope this will help save the balance.—Mrs. Frank Metcalf.

Bumblefoot.

About a month ago some of my hens showed swollen ball on the bottoms of their feet. The swelling keeps getting larger and has black spot in center. Hens are large and in good condition and seem to scratch and walk as well as ever.—V. L., Gridley.

This is bumblefoot, and we refer our subscriber to Mrs. Metcalf's answer to similar query on preceeding page.

It is possible the roosts are too high and the heavy hens have their feet bruised by jumping to the hard floor. Lower the roosts if possible.

GAPES.

With the coming of the little chicks come their enemies also, one of the worst of which in some sections is the gape worm producing gapes. Many who do not know the cause cannot understand any method of cure. The following by one of our best authorities on poultry troubles may help some of our readers to avoid loss:

A bird suffering from the gapes is easily recognized, as it stands extending its neck, frequently yawning or gaping; a wheezing cough is sometimes noticed, and when there are many worms present the bird will froth at the mouth. If not attended to, the bird will become suffocated and die.

In and upon all warm-blooded animals and birds there are two distinct forms of parasites to be found, the animal and the vegetable. The most troublesome of the latter parasites is "ringworm." From the name one would suppose it was due to a worm, but this is not the case, but to a minute fungus. The disease known as favus, affecting the combs of fowls, is also due to a vegetable parasite. The disease occasioned by the former form of parasite, the animal, are many, the most common, as far as fowls are concerned at any rate, being gapes. It mostly affects birds from one to six months old, although as already stated, older birds are liable to it. Gapes is due to the presence of animal parasites in the throat of the bird, which are termed syngamus trachealis, or to game keepers the red or forked worm. On examining the trachea and bronchia of a bird showing these symptoms, from three to a dozen, and perhaps even more, small red worms will be seen. These are forked shaped, though sometimes straight ones are noticed. The former of these are the copulating males and females. The males are considerably smaller than the females, and are attached firmly together, so much so that they can not be separated without tearing the tissues. The ova of the female contains fully-formed embryos, which escape by the rupture or the decay of the parent. They hatch in damp earth or water in from one to six weeks, according to temperature. When they are swallowed by the bird they develop into adults, and are able to reproduce in their turn in less than three weeks' time. No second host is required. The embryos are able to remain alive in the alimentary canals of earth-worms, and this is one way of the disease spreading.

Perhaps one of the most important points in connection with the care of gapes is that immediately a bird dies it shall be burnt and not merely buried in the ground, as is often the case. As will easily be seen, if the bird is thus treated the parasites are allowed to breed, which they do quickly, and the worms come up to the surface of the ground and are eaten by the chickens. Therefore, as a precaution, always burn the bodies of birds that have died of this complaint. There are many remedies and cures for this disease, if it may be termed thus. One of the oldest, but at the same time one of the most efficacious, is that of soaking the grain in urine before giving it to the birds. The ammonia escaping from the urine proves fatal to the red worms and their embryos. Another old method, but a good one, is that of inserting a feather down the throat of the bird, a feather that has been previously dipped in paraffin oil or turpentine. When down the throat it should be given a sharp turn, and then drawn quickly out, and frequently some of the worms stick to the feather, and are thus extracted.--Rural World.

Overfeeding is occasionally responsible for soft shelled eggs. When hens are overfed they grow fat, which prevents the eggs shelling properly. Wheat, oats and corn contain a goodly percentage of lime, while it must not be overlooked that weeds and grasses, when young and tender, contain lime, and hens if allowed to run in the field will soon recover and secrete their lime supply from various sources. Another cause often overlooked is that hens of a prolific strain produce eggs too rapidly anyway, and should not be fed any stimulating feed, as nature can't keep pace with the eggs. They do not remain in the oviduct long enough to be shelled. Again, this is caused sometimes as a result of allowing too many cocks with the hens, which should be prohibited in some way. Only use the cocks when breeding your hens. Also, I have known frights from dogs, etc., to be the cause of non-shelling of eggs."

Don't let your fowls get all run down during hot weather and molting time, but keep them in good condition.

Egg-More Booklet

tells you how. It is free. Send for it. Send us addresses of 5 persons in your vicinity who have fowls, and we will send you postpaid, an Anchor Egg Separator. For 20 addresses, we will also send The Poultry Manual, a book well worth 50 cents.

How Much Is Water Worth?

Water is very expensive if you are buying a disinfectant that is half water.

Coulson's CRESOLENE

is a powerful disinfectant and germicide made from coal tar. You add the water yourself to make the disinfectant desired strength. COULSON'S CRESOLENE must be diluted from 20 to 100 times its own bulk. It is not poisonous—more powerful than copperas, cloride of lime and other well-known disinfectants. It forms a milky emulsion that only costs 1 1-4 cents a gallon. It is the cheapest disinfectant on the market and at the same time the best. Use it on stock—poultry—dogs or as a general disinfectant and insecticide.

If your dealer does not keep it, order direct from us. Quart cans—50c. Gallon cans—$1.25. Freight free on gallon orders.

Bees and Their Care

HONEY CROP CONDITIONS.

THROUGH courtesy of Mr. B. G. Burdick, President California State Bee-Keepers Association we have received copy of estimate of this year's honey crop, gathered by the Colorado Honey Producers Association. The association has spent some weeks in gathering and compiling the report from which the following summary is taken. It presents an excellent review of the conditions in bee-keeping seotions of the entire West, giving locality, character of honey flow to July 1, 1910, prospects for balance of season, and quality.

Colorado.

Denver and vicinity, very light, poor unless rains come soon.

Northern Colorado.

Port Lupton, nothing, poor on account of grasshoppers; Loveland, steady and fairly good, fair, quality O. K. Greeley, poor, very poor, good quality; Platteville, very light, none. Timnath, heavy last week, not good unless plenty of rain. Boulder, hardly enough to keep breeding up to desired limit. Longmont, poor, not good.

Platte River Valley.

Weldona, none so far, unfavorable. Merino, none, very poor. Sterling, none, very poor.

Arkansas Valley.

Canon City, none, not encouraging. Las Animas, good, good, quality the best. Rocky Ford, good, good, good. quality. Olney, up to standard, very good, fine quality. Olney, up to standard, very good, fine quality. Ordway, too cold up till ten days ago, since then good, fair, A No. 1 quality.

Southern Colorado.

Hoehne, very limited, small crop. La Veta, just got up in supers, need rain to make prospects good.

Western Slope.

Montrose, good, not very good. Crawford, flow just beginning, prospects poor account of dryness. Delta, good, fair, fine quality. Montrose, not very good, good for average crop. Grand Valley, light, very good, quality very good. Grand Junction, very good, good except for grasshoppers, very good quality. Mancos, scant, very poor unless rain comes, not very good quality.

Nevada.

Yorington, medium, doubtful, some honey dark on account slow run. Wabuska, starting in good, fair, very good quality. Smith, very small, fair, very good quality.

Wyoming.

Wheatland, none until last few days, poor. Douglas, none, very poor. Lander, prospects good, sweet clover and alfalfa honey.

Utah.

Huntington, just commencing, good, very fine quality. Ogden, very little from first crop alfalfa, good as usual.

Oklahoma.

Maysville, good, good, very fine quality.

California.

Redlands, orange flow good but short, prospects one-fifth crop, good quality. San Marcos, nearly entire failure, none to store, light amber quality. Colton, light, unfavorable. Lassen county, good, good, good quality.

New Mexico.

Belen, very poor, very poor, good quality. Albuquerque, good, good, unusually good quality. Mesilla Park, no honey taken off as yet, poor.

Idaho.

Nampa, very good, good, good quality.

Montana.

Billings, fair, good, good quality. Rancher, steady and heavy, good, first class quality. Miles City, none, poor.

Kansas.

Hutchinson, not very good.

Oregon.

Dell, good, very good, better quality than usual.

CENTRAL CALIFORNIA BEE NOTES

The dreaded black brood, European foul brood, that has been so destructive in Fresno county for two years past, has not yet been reported in Merced or Stanislaus counties. But the American foul brood has gained a strong foothold in all the counties of the valley.

Bees wintered well, but an unusual spring has been unfavorable to the bees as the usual early flowers did not yield the usual nectar, and many colonies were reduced to mere nuclei by the twentieth of May. By the first of June the nectar was more plentiful, but colonies are weak with but very few swarms for the season.

The famous Turlock Irrigation District canal was placed out of commission early in May by a bad break that took weeks to repair with a large force of men and teams. This deprived the farmers of water for nearly six weeks which means short crops, and the bee-men, incidentally, suffer their share in the matter.

With a generally short fruit crop over most of the eastern states the bee-men of California look for higher prices on honey than for some years past.—J. G. Gilstrap.

CONCERNING NOTICES.

We have received from Bee Inspector Gilstrap of Stanislaus county blanks of notices which he serves on apiarists of his county. As he suggests, the printed form adds somewhat of dignity to the serving and inspires more respect for the notice. Many inspectors simply serve verbal notice which the careless or indifferent apiarist regards lightly. For the benefit of others who may wish to use a regular form, we give the blank notice which Mr. Gilstrap serves. These blanks are bound in book form with stubs containing in the main blanks for same information which is on the notice.

Notice of Inspection of Bees. From Inspector of Apiaries.___________1910. You____are hereby notified that in accordance with the statutes of the State of California relative to inspection of bees, which provides that all bees that are in boxes or immovable frame hives within a radius of three miles of any apiary infected with "foul brood" or other infectious or contagious diseases, shall be, on the order of the Inspector of Apiaries, transferred to movable frame hives or be burned. You____are therefore notified that such disease exists in_____ apiary within three miles of your bees. You are obliged to transfer all such bees ______ boxes in number, to suitable frame hives, on or before _________1910, and that none of such bee hives shall be moved from present location until so transferred and inspected. * * * You______are hereby notified that all hives of bees in your possession_____infected with infectious or contagious diseases shall be properly treated by you within five days after this notice is served on you; or said infected hives, combs and bees will be burned by the inspector.—Inspector of Apiaries.

Coachella Valley fig trees have proved very profitable this season.

General Agriculture

HIGH COST OF LIVING.

I BELIEVE that one secret of the high cost of living is explained by the fact that a few years ago ships from this country to foreign countries carried only flour, whereas today we are shipping millions of bushels of wheat. This removes from our country some hundreds of thousands of tons of middlings and bran, or in other words reduces our beef and pork producing capacity and likewise affects cheese, poultry, eggs and other products. This has also given to our foreign competitors greater producing power along the same lines. It may be said that the foreign trade does not take all of our bran and middlings from us, but it is taking sufficient to make the rest sell at exceptionally high figures. I have seen beef selling on foot at 2½ cents and pork at 4½ cents, but it cannot be produced today at any such figures, especially when we have to pay 1½ cents per pound for feed, as it takes about seven pounds of feed to make one pound of beef or pork.

There are other factors in our high cost of living but I believe this is the chief of them.—W. S. King, Santa Ana.

UTILITY OF GOOD ROADS.

(Continued from Page 75.)

on which the solution of the problem of the high cost of living depends. It may be taken as a general proposition that there is not one of the beneficial effects mentioned above as resulting from the construction of good roads, which is not increased many times by the invention of the motor car. If good roads increase the value of farm lands, good roads plus the motor car tend to increase their value still more. If good roads reduce the cost of living and bring back population to the country districts, curtail the power of the middleman and increase the power of the farm, each of these ends can be achieved more quickly, more certainly and to a greater degree with the aid of the motor vehicle.

From the viewpoint of the road engineer, the necessity for a central system of supervision of road construction is clear. Mr. Logan Waller Page, Director of the Office of Public Roads, United States Department of Agriculture, who with a merely nominal appropriation of $114,240 annually at his disposal is doing technical and educational work of the greatest importance to the road systems of the country, says:

"Road building is an art based upon a science. In this age of specialists, it almost surpasses belief that the American people, so practical in all other lines of endeavor, should permit their golden millions to be frittered away by men who for the most part know little or nothing about either the science or the art of road building. There are today more than one hundred thousand petty road officials in the United States, each and all receiving compensation. Very few of these men devote more than a fraction of their time to road work, because their interests lie elsewhere and their compensation is too small to enable them to devote their entire time to the work. It is not surprising that a century and a quarter of this kind of supervision has resulted in the present chaotic condition of our public roads. The reforms that should take place will provide a comparatively small body of trained, competent road builders, devoting their entire time to continuous road work."

It is estimated that $40,000,000 of the $80,000,000 at present annually spent in America on roads might as well be thrown into the sea. With a system of scientific Federal supervision like that of the Department of Bridges and Roads in France, this vast sum could not only be saved, but be applied with treble efficiency.

It must be remembered that the construction and maintenance of a modern highway presents from the technical side a more difficult problem than the construction and maintenance of a railroad. What great railroad system would delegate the duty of looking after its road bed to the communities through which it passes, or would think of having a separate track maintenance department for each state and county it traversed? In the case of a trunk highway system the call for central administration is equally pressing, as it is impossible to confine within the boundaries of any one State the mileage which shall be treated as a unit under one authority. A state boundary is a political division, with no more real reference to a railroad or a highway than it has to a river.

From the farmer's viewpoint there is, however, one question which arises here. He will say: "What we want is farmers' roads, local roads, market roads. We want to get about our immediate neighborhoods, not to make long trips." The answer is that when the Federal government constructs the main post roads the state is left free to construct the county and local roads. As Mr. Page says in this connection: "Classification, which is a prominent feature in all of the leading countries of Europe, contemplates the character and extent of improvement exactly adapted to the needs of traffic on each road." And, again, "The first work to be done on the roads themselves is their classification."

One word in conclusion—While the growing use of the motor car in the country districts and the systematic improvement of our country roads will be of incalculable benefit both to the farmer and to the nation, there is an abuse both of the motor car and of the roads which all must unite in suppressing, and that is reckless driving. The law abiding car owner has no use for the speed fiend because he brings automobiles into disrepute. The manufacturer has no use for the speed fiend because the resulting abuse of the car depreciates it and the maker gets the blame. The roadmaker has no use for the speed fiend because it is the abuse of the roads by the motor vehicle and not their proper use which tears them up. The public has no use for the speed fiend because he is a common danger to life and limb. By force of public opinion, by education, and if need be, by drastic penalties, he must be eliminated, and the feeling of the farmers in this matter is shared by every right-thinking person in the community. The day of the irresponsible chauffeur is drawing to a close.

KEEN KUTTER
Farming Tools

No imperfections in temper, mistakes in adjustment, or wrong calculations for size and weight are ever discovered in Keen Kutter farming tools. They fit the hands, and arms and height of the average man as no other tools do or can; and the reason lies in the fact that the makers construct no tools until *experiment proves the model right.*

E. C. SIMMONS KEEN KUTTER TRADE MARK REGD.

Note this Keen Kutter spading fork—true as a die, just long enough, just heavy enough, and full of springy temper and long wear. It illustrates the good qualities of other Keen Kutter tools—scythes, hoes, rakes, forks, axes, shovels, etc., every one of which is backed by the liberal Keen Kutter guarantee.

Always buy Keen Kutter tools for farm and workshop—the line includes everything for both outdoor and indoor workmen as well as pocketknives, razors, shears and table cutlery.

"The Recollection of Quality Remains Long After the Price is Forgotten."

The Tee Irrigating Valve

Simple in design and construction, costs less and will last longer than any other on the market.
The Tee Irrigating Valve is made of an ordinary malleable iron T with a brass plug. It is designed for those who want an inexpensive irrigating valve, especially where such valves are needed in large quantities. There is nothing to get out of order. It is so simple you will wonder why it was never thought of before.
A ½-inch valve sent post paid upon receipt of 40 cents. Quantity price, circular and full information upon request.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Bitter Cream.

The milk from one cow, or rather the cream, is bitter after standing 12 to 24 hours. She is fed nothing but clean hay and grain. If we succeed in making butter from it, the butter soon tastes and smells rancid. Are drying her up for beef. If she should breed and we kept her till she freshened, would the milk and cream be good?—Subscriber.

There are some things hard to explain. I never knew of a healthy cow to taint her milk through her body except when in a very advanced stage of lactation. Can there be any mistake in this cow's condition? Could she have been bred? If that is not possible, then I should test the milk in the following way: Milk each teat separately, discarding the first couple of streams from each teat. This takes out any bacteria that may be in the outer milk ducts. Set the milk from each teat and see if the usual result follows. The cow's habits should be watched; she may go into dirt that the other cows avoid and in this way make herself a source of bacterial infection, I have had cows that sought out all the muddy, slimy places to rest on in a pasture, while others were always sure to find a resting place, on the clean dry sand. The matter seems to resolve itself into whether it is wise to retain this cow until she freshens and then try her again or if it is cheaper to beef her now and put another in her place. The price of feed must decide this matter.—M. E. S.

Dairy Questions.

Have planted what seedsman's catalogue called amber sugar cane for green feed for cows. Now I am told the second crop causes sickness. Is this so, and if so, why? Is it wise to immediately breed a heifer after the first calving. Heifer is just two years old, calf six weeks. She gives two gallons a day. Is that good for Jersey heifer?—Subscriber.

We have been feeding amber sugar cane or sorghum for twenty-four years without having any sickness from it that was at all mysterious. It will bloat cows badly if they are turned into it after having been on dry alfalfa, but not any worse than alfalfa would do under the same condition. It is well to remember it is a green feed that cows are very fond of and if they are allowed to eat unlimited quantities, until they have become somewhat accustomed to it, they will surely suffer. If one bloats use the same treatment customary for alfalfa bloat.

I would wait two or three months before breeding a heifer this young again. If she is not allowed to grow now she will remain stunted for life. Then too the early education of a heifer to milk for a year is important for it will make her a long milker afterwards for life. Some people breed at once for fear they may fail to again get the heifer with calf. This I hardly think is well founded in fact. It is more carelessness in not watching the animal in time. Now this heifer should be pushed on milk making foods right along to develop the udder and to make her strong for her life work. As to the amount of milk, if the milk is rich it is all that could be expected from so young an animal under ordinary conditions.—M. E. S.

Grape Leaves Dropping.

The leaves on some of the vines in a good bearing vineyard of Emperors turn brown, beginning at outside, and fall off. Then new leaves come out. Some of the vines die in winter. Can you tell me what the trouble is and how to remedy it?—D. B., Fresno.

This may be alkali, lack of drainage, or phylloxera. The description is not definite enough to tell. Write to Prof. Fred'k. Bioletti, University of California. He will send some of his men in the field to examine this vineyard. There are two men now in the field at Fresno that would do this work.—M. E. S.

Knotweed—Joint Grass.

A specimen of weed was sent to this office from Imperial Valley with the remark that it was often called there Devil's Shoestring.

This was submitted to a botanist who says that it is the European knotweed or Polygonum aviculare, a common but not particularly troublesome weed which prefers the beaten roadside or wayside path. It is a decumbent, wiry plant, annual and perennial. It is of the same family as the smartweed, buckwheat and several other plants.

Snakes.

I noticed in a recent Cultivator that a subscriber wished to know how to rid his place of snakes. If his place is fenced, let him turn in hogs. It is said a rattlesnake is better than an ear of corn to a hog.—H. A. Snavely, Wilcox, Ariz.

In addition Mr. J. C. Oestergard of Burbank, Los Angeles county, suggests that if the rancher will eradicate the squirrels on his place this will so reduce the food of the snakes that they will disappear. He also suggests that at this time of the year squirrels fall easy prey to poisoned melon rinds, as the shortage of water makes succulent food very attractive. The strychnine should be judiciously distributed so as not to make the melons bitter. In winter when the grass is green he finds poisoned wheat satisfactory.

PERCHERON SOCIETY.

The Percheron Society of America has, since December 1908, endeavored to induce the Federal authorities to furnish promptly a list of the names and numbers of all horses imported, so as to provide the Secretary with a check list with which to compare foreign certificates sent in for record. June 16, 1910, the Board went still further and urged that the Federal Government provide an inspector at ports of entry, to see whether the horses and foreign certificates agreed ,and submit a report on same, immediately, to the Secretary of the association. The Government has indicated a willingness to do this, but has so far failed to carry out such a plan, and the situation is now such that the Society has found it necessary to make such inspection for identification at its own expense. This will be confined entirely to seeing whether the horses and pedigrees correspond, will be made at the port of entry by a competent inspector employed by the association, and will start at once. The Society regrets the necessity of undertaking work which the Federal Government might very properly do to help the breeders and importers, but until the Federal authorities will take charge of this, the Society must protect itself. In cases when the horses and foreign certificates do not agree, registration will be withheld until the importer straightens matters out. If he cannot, no American certificate will be issued, and the Federal Government will collect duty on the animal in question.

It is interesting to know that 2726 breeders are members of the Society and are transacting all their business with it. Since June 25, 1909, 730 more breeders of Percherons have become members of this association, and new applications for membership are coming in daily.

Veterinary

Answers in this column by Dr. R. T. Whittlesey, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Swelling in Head.

Last week early in the morning I noticed a Jersey heifer sick. Her head and tongue seemed swollen; by night the tongue had swollen so much that it choked her to death. I know of no other symptoms. She was in a small cleared lot and a few hogs were in it with her, so do not think it could have been caused by snake bite. Could it have been an insect bite?—Subscriber, Holtville.

The symptoms given are too meager to make a diagnosis. A post mortem examination would probably have shown an abscess forming in the throat that prevented return flow of blood. In some cases of anthrax the head will swell fast and death take place in a few hours.—R. T. W.

DR. WHITTLESEY'S VETERINARY REMEDIES.

These are not ordinary mixtures but are from well tried formulas, used in an extensive practice in Southern California for nearly a quarter of a century. Dr. Whittlesey's Sulphur Arsenical Salve for deep fistulous or ordinary chronic, indolent sores such as. "Poll Evil," "Fistulas," "Quitters," "Thrush," "Scratches," "Warts," "Collar Sores" or "Sit-fasts," $1.00 per package postpaid. Printed directions. Dr. Whittlesey's Antiseptic Healing Powder forms a coating over raw surfaces, excludes air, flies and floating germs. Makes a cheap and convenient dressing for the many sores that occur to stock on the ranch. $1 full pound can postpaid.

DR. R. T. WHITTLESEY,
Veterinary Hospital, 714 East Seventh St., Los Angeles, Cal.

CORN HARVESTER.

A most practical corn harvester is made by the New Process Mfg. Co., of Salina, Kansas. It will do almost anything that a corn binder will do and cost only a fraction as much. With it a man can cut and shock from four to six acres a day, and it is so simple in construction and operation that a boy can run it. It has been sold in every state in the Union, and has given universal satisfaction. It will pay for itself in less than one season, and is so compact and well made that it will last for years.

If you will write them, mentioning this paper, they will send you full particulars.

Money Making Little Liners

In this department we will insert your advertisement under a classified head for 1½ cents per word. No ad accepted for less than 25c. Our classified columns are the clearing house for our many thousand readers.

MACHINERY.

FOR SALE—SECOND HAND
WINDMILLS, TANKS,
PUMPS, ENGINES,
FARM MACHINERY,
that will do the same work as new at half the price. Domestic and irrigating windmills and tanks; all sizes. Tanks from 50 gallons up to 50,000. Engines—three 2 H. P. Fairbanks; 3 H. P. Dempster, 6 H. P. Fairbanks, 6 H. P. White & Middleton. 9 H. P. Moore, 10 H. P. Lambert, 18 H. P. Western, 25 H. P. self-contained engine and mining hoist, brand new 2 and 4 H. P. steam engine and boilers. Farm wagons, threshing machine, baler, header, Fosmer gang plow and Venicia disc gang breaking plow, road plow, sacker, hay truck, wagon tanks, slip and Fresno scrapers, wood sawing outfit mounted, splitter, weeder, fruit crusher, bone grinder. Most anything a rancher wants, second hand. DEMMITT CO., upstairs 120 N. Main, Los Angeles.

FOR SALE—11 H. P. WHITE & Middleton Gasoline Engine, guaranteed same as new. Also 15 H. P. of another make. BAILIE & BRANDT COMPANY, 943-945 No. Main St., Los Angeles, Cal.

FOR SALE—AMES NO. 2½ DEEP Well Pump and cylinder, rods, etc., cheap for cash. Also distillate engine. MACHINERY EXCHANGE, Main and Bruno Sts., Los Angeles, Cal.

TREES.

FINE LARGE EUREKA LEMON AND Valencia Orange trees, fine for replanting. Choice lot of fine Wash. Navels. Order quickly. They are going. Home 'phone 1731. JOHN R. KING, Whittier. Cal.

SURPLUS STOCK. MONTEREY PINES, 10 feet, 85c. Camphor trees, 3 feet, 28c. Black Acacias, 8 feet, 35c. Arbor Vitae, for boundary line planting, 15c. Canary Pines, 2½-3 feet, 45c; 8 feet, $1.50. BALLOU'S NURSERY, Pasadena, Cal.

MARSH SEEDLESS GRAPEFRUIT—600 large trees for sale. E. S. THACHER, Nordhoff, Cal.

LATE VALENCIA ORANGE TREES for sale for May and June delivery. ADOLPH RIMPAU, Anaheim, Cal.

FOR FIRST CLASS VALENCIA AND Navel orange trees and Eureka lemons see A. G. SNOW, Oxnard, Cal.

WANTED.

WANTED—YOUR WORK PAYS THE expense to learn a trade that pays $5 a day, in a few months' time; electricity, automobiles, plumbing, bricklaying; actual contract jobs; 200 students last year. UNITED TRADE SCHOOL CONTRACTING COMPANY, 647 Pacific Electric Bldg., Los Angeles, Cal.

A FARMER, UP-TO-DATE AND A hustler, wants a place as foreman or superintendent. Is thorough in general farming, irrigation, vine and deciduous fruit growing. Experienced in working all kinds of labor, both tenant and wage system. Address BOX 647, Monrovia, Cal.

EDUCATED GERMAN, PRACTICAL dairyman and rancher, wishes position as superintendent on large dairy ranch. Send letters under name of A. BADER, General Delivery, Pasadena, Cal.

WANTED—TO RENT LAND FROM 30 to 100 acres, good alfalfa land with water for irrigation; or what have you to offer to an experienced farmer who can give first-class references? Address A. C. WEBSTER, Chatsworth, Cal.

HORTICULTURAL PRINTING.

THE KRUCKENBERG PRESS, 123 South Los Angeles St., Los Angeles, Cal., makes a specialty of Horticultural Printing and Engraving. Cuts and illustrations of all standard, economic and ornamental plants on hand and subject to the use of patrons without cost. Samples and estimates cheerfully furnished. Remember, we design, write, engrave, bind and print; in brief, do the "whole thing," at no additional expense to the customer. Correspondence a pleasure; a personal visit a joy. Headquarters for catalogues and quadri-color printing.

RABBITS.

FOR SALE—EUREKA RABBIT WARren Co., 928 Valverde St., Los Angeles, Cal., Wright and King, props. 150 fine bred New Zealand hares and 200 fine bred Belgian brood does and stud bucks from $1.00 up. Your correspondence is solicited.

RARE PLANTS.

FINEST THINGS FOR LAWNS. Feathery, not running, Bamboos; Arundinaria falcata, and Arundinaria Falconeri. For sale by the MONTARIOSO NURSERY, Box 1500, Santa Barbara, Cal.

WILD PLANT IMPROVEMENT GARdens, Santa Ana, California. NEWTON B. PIERCE, Proprietor. Rare choice ornamentals and new fruits from all lands.

POULTRY.

HOW TO MAKE MONEY—MRS. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1.00. Address Mrs. A. Basley, Box 77, Venice, Cal. Send postal.

FOR SALE, AT A BARGAIN, AT 956 E. 33rd Street, about 60 White Wyandotte hens and about 250 head of young stock, ranging from two weeks to four months, all from prize stock. Together with incubators, brooders, Philo houses, and everything complete for a start in the chicken business. By a party who has made a success of it, but is forced to sell on account of business in the East which will require his constant attention.

CHICKS! CHICKS! CHICKS! CHICKS!
2500 Per Week.
Barred Rocks, Rhode Island Reds, White Rocks, Brown and White Leghorns. We ship safely everywhere within 48 hours. Send today for free 32-page book. Tells all about the chicks we offer and gives prices on laying hens, pullets, cocks, etc. PIONEER HATCHERY CO., 112 East 8th St., Los Angeles.

POULTRY WANTED—WE PAY THE highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. ALLAWAY & LAYTON CO., 607 E. 3rd St., Los Angeles, Cal.

FOR SALE—EIGHT HENS AND COCK, Rose Comb Black Minorcas (Northrup strain). Seven hens and cock, White Minorcas. All pure bred, fine stock. Also pullets and cockerels, and Rhode Island Reds. C. U. CHAMBERLIN, Gem City Yards, Los Gatos, Cal.,

FOR SALE—PURE BRED BARRED Plymouth Rock chickens. Crane and McClanahan strains. March hatch. $10.00 a dozen, $1.00 each. Mated pens. MINNEWAWA VINEYARD, Fresno, Cal.

LOVELL'S BLACK MINORCAS
California's
greatest egg producers
Pedigreed, trapnested, scientifically bred. Free circular. DAVID J. LOVELL, 5720 So. Park Ave., Los Angeles, Cal.

BONNELL'S S. C. BLACK MINORCAS win every time, the best that can be secured at any price. Eggs reduced to $1.50 per setting. A few cockerels for sale. C. C. BONNELL, State Vice President American Black Minorca Club, 2919 Brighton Ave., Los Angeles.

WHITE INDIAN RUNNER DUCKS. Some fine breeding stock for sale. Also eggs from Howard's strain White Leghorns. J. C. CARLYLE, R. F. D. 4, Box 249, Los Angeles. Successor to Mrs. Grey. Phone Sunset South 6342.

LODI HATCHERY—JUST HATCHED, chicks from healthy, heavy laying stock. Booking orders for later delivery. T. C. HAWLEY, 504 E. Elm St., Lodi, Cal.

FOR SALE—EGGS FOR HATCHING from thoroughbred Mammoth Pekin and Indian Runner ducks, 75c per 12, $5.00 per 100. A. E. NELSON, El Monte, Cal.

THEY LAY AND WIN. ROSE COMB Black Minorcas. ELEANORE MINORCA FARM, Route 1, Los Angeles, Cal. Stock for sale.

SINGLE COMB BROWN LEGHORN eggs, $5.00 per hundred, $1.50 single setting. MRS. E. FORAN, Box 445, Visalia, Cal.

S. C. BLACK MINORCAS, CHOICE hatching eggs and stock for sale. S. D. BICKFORD, Gardena, Cal.

LIVE STOCK.

JERSEY CATTLE FOR SALE—REGistered heifer calf, well bred, $25.00. Unregistered bull calf, $10.00. Unregistered yearling bull, $35.00. HENRY H. JAMES, proprietor Franklin House, Fair Oaks, Sac. Co., Cal.

REGISTERED SHORTHORN BULLS and Poland China Hogs for sale. Best breeding. P. H. MURPHY, Perkins, Cal.

JERSEY BULL FOR SALE. THREE years old, muley. A good one. NICHOLAS MARTIN, R. D. 13, Box 81, Los Angeles, Cal.

DAIRY SUPPLIES.

MILK COOLERS, BOTTLES, CAPS, brushes, Buhl milk cans, Sharples separators, Babcock testers, veterinary instruments, wood soled boots and shoes, and our celebrated "Prosperity" washing powder. GUY F. KELSEY, 108 E. 8th St., Los Angeles, Cal.

FARM LANDS FOR SALE.

FOR SALE—OWENS RIVER VALLEY. We are preparing to place upon the market 4000 acres of the choicest apple land in the Owens River Valley, which will include one of the most remarkable gravity water systems in the State. This land is wonderful in its productiveness beyond all belief; potatoes that run 500 bushels to the acre, alfalfa three tons to the cutting, timothy with 12-inch heads, the world's fair prize for honey, and last but not least, the finest apples grown on the Pacific Coast. Red winter apples that look like wax. No other land in California to compare with it. Not flat valley land, but foothill land with gentle slope, giving perfect drainage. The choicest apple land will be subdivided into tens, twenties and forties. The most wonderful scenery in America. Fishing and hunting in the high Sierras right at your door. Trout streams within walking distance. Southern Pacific's new main line east now building through valley, but will not be finished until spring, when this land will be formally open for inspection. In the meantime send in your name and address for booklet, plats and price list, which will be mailed to you as soon as they come from the press. This land is not for speculators but for real serious farmers who know the virtues of choice land, water and climatic conditions when they see them. Will make a special and attractive proposition to buyers who will go in this summer and start their improvements before the formal opening in the spring. Will be glad to take a few serious people with me on my next trip into the valley. JAMES R. H. WAGNER & H. S. COOK, 825 Wright & Callender Bldg., 4th and Hill Sts., Los Angeles, Cal.

IF YOU WANT AN UP-TO-DATE, money making home, see me at once. I have a nice little 40-acre fruit, vegetable and poultry farm. Level, good land, assorted fruits and berries on main country road, 3 miles from two good towns, all fenced and cross fenced with poultry netting. Well equipped for chicken business; three large 576-egg incubators, six large brooders run by gas, brooder house 2000 chick capacity. Buggy, wagon, mare, reaper, gang plow, drill and other implements, tools, etc. A neat six-room house lighted by gas. Fairbanks-Morse gas engine run by gas, operates grain and shell crusher, grindstone, wash machine, pump, etc. Fine water and lots of it piped to all parts of place. 5000-gallon tank and tank house, barn and other buildings. Price $4500, as owner must leave. $1500 cash takes it. Balance 10 years, 8 per cent. WM. MANTZ, Santa Maria, Cal. Box 578.

FOR SALE—815 ACRES IN SAN LUIS Obispo County. A typical dairy ranch. Plenty of wood, water, irrigable land, buildings, fenced and cross fenced. Orchards, vineyards, oranges, lemons and walnuts do exceedingly well here. 40 acres of land suitable for these. Price $21 per acre. For further particulars apply to MRS. F. A. CLINK, Pozo, Cal.

2285 ACRES CHOICE, DEEP, SANDY loam. Ideal for subdivision or Eucalyptus growing. Can be cultivated any day in the year. Southern Pacific Railroad runs through the ranch. Also close to deep water for shipping. Free from wind and frost. Now all planted to grain. Price $100,000.00 for limited time. GEO. W. SILL & CO., Watsonville, Cal.

IRRIGATED LAND FOR SALE, cheap. In the Lower Rio Grande Valley of South Texas. Ideal climate. Good markets. Large crops. Special inducements to several practical irrigation farmers. Address MANAGER, care of Cultivator, at once, or AMERICAN RIO GRANDE LAND & IRRIGATION CO., Mercedes, Hidalgo County, Texas.

BARGAIN IN FRUIT OR DAIRY ranch. I have for sale 160 acres of No. 1 fruit land in peach and raisin belt of Fresno county. On line of proposed Fresno and Monterey Electric Railroad. Level as floor and all irrigable. Water rates 33 1-3 cents per acre per season. Price $2200. Half down, balance time. CARL R. FLORY, Lemoore, Cal.

APPLE ORCHARDS, LARGE AND small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. GEO. W. SILL & CO., Watsonville, Cal.

FRUITS, FLOWERS, SUNSHINE, progress—all these invite investigating beautiful Hemet Valley, Southern California. Booklet free. WILLIAM KINGHAM, Hemet, Riverside County, Cal.

FOR SALE—EL CAJON GRANT LAND. In the heart of El Cajon Valley, 30 acres of choice vineyard, large house, cottage and barn; trays, boxes, etc. Close to proposed electric line. S. B. HAWLEY, 1548 D. St., San Diego, Cal.

FOR SALE—PERRIS VALLEY, 640 acres choice alfalfa land, close to railroad, water guaranteed, $50, big snap. STACY REALTY CO., 531 So. Spring St., Los Angeles, Cal., F 2115; or Stacy-Wagner Co., Riverside.

FARM LANDS FOR SALE.

IF YOU WANT NO. 1 GOOD LAND, see me. I have four eighty-acre tracts, all level, three miles from good markets, good crops, water, fenced. One tract is improved. Price $50 to $80 per acre. One-half cash, balance five years, 8 per cent. I also have a fine, level piece of rich sandy loam land, 160 acres, desert claim, in San Luis Obispo Co., 12 miles from the Great Lake View gusher at Maricopa. Will sell my right for $500. This is a bargain. I have more land than I can farm, so come quick. WM. T. MANTZ, Santa Maria, Cal.

80 ACRES FOR $2000 CASH. IMprovements consist of a house, fences, pumping plant, artesian well, etc. Good chance for dairy, poultry or truck farming. BOX 334, Lancaster, Cal.

WAUKENA, A GOOD PLACE TO farm hogs, alfalfa, grain, fruit successfully. Write C. F. COLWELL, Waukena, Cal.

MISCELLANEOUS.

FOR SALE—1160 FEET SURFACE IRrigating pipe, 8 in., good as new, $150, f. o. b. Richfield or Anaheim. Address J. L. DAVEE, Olive, Orange Co., Cal.

SHOEING THE FARM HORSE.

The farm horse is generally an all-around-purpose animal, and, for this reason should be shod. In addition to its being obliged to do the ordinary farm work, it is also used for hauling farm products to market, and for a pleasure animal for the family.

Traveling on the hard roads would soon cause the feet to become sore if left unshod, later lameness, and loss of the use of the horse.

The farm horse should be shod with a moderately heavy shoe, one that will be durable and protect the feet. The shoes should have low calks in order that the frog may touch the ground. In winter the calks should be sufficiently long to get a good foothold on the slippery roads. If the feet are obliged to have shoes with the long calks for 3 or 4 months, then a bar shoe is to be recommended. The never-slip calks have become popular of late years for the reason that the calks are quickly removed and new ones replaced, thus saving time and money.

Just as great care should be taken with the shoeing of the farm horse as is taken with a valuable race horse. The feet should be perfectly leveled and placed at an angle of from 45 to 50 degrees for the front feet, and from 50 to 55 degrees for the hind ones. The shoes should not be fitted hot as they are likely to start diseases of the feet which might cause trouble later. The shoe should be attached to the foot with as small nails as will be necessary to hold it in place. Then, as in shoeing all horses, the nails should not be drawn too tightly and pinch the sensitive structures.

It is best to have the shoes reset every four to six weeks. If the horse can be kept off the road during the summer months, have the shoes pulled off and allow the feet to come down to the ground and get the natural frog pressure. The feet should be kept growing; then there will be very little trouble from the feet getting dry. Oil the coronary band of each foot twice a week. This band is located just underneath the hair line. It forms the horn of the wall, and if a new hoof is produced normally, the foot will not have time to become too dry.—C. L. Barnes, Colorado Agricultural College.

"Are you doing anything for others?" asked the philanthropist. "Sure," answered Mr. Crosslots. "I make a garden every year for the benefit of my neighbors' chickens."—Washington Star.

MOTHER GOOSE ON THE PRICE OF MEAT.

Little Jack Horner sat in a corner,
Eating some cake and pie;
'Twas bad stuff to eat, but he couldn't have meat
Because the price was so high.

Little Miss Muffet sat on a tuffet,
Eating of curds and whey;
Poor child, she was achin' for liver and bacon,
But the price was too heavy to pay.

To market, to market, to buy a fat pig,
Home again, home again, jiggety jig,
With nothing but turnips, potatoes and meal—
The price was too high for pig, mutton or veal.

There was an old woman, and what do you think,
She lived upon nothing but victuals and drink;
Garden stuff made up the whole of her diet;
She'd have liked a good steak, but was too poor to buy it.

There was an old man of Tobago
Who lived on rice, gruel and sago,
But a great millionaire
Left him money to spare,
And now to a beefsteak he may go.
—S. E. Kiser.

JELLY AND JELLY MAKING.

IN CONNECTION with studies with fruits, J. Belling, of the Florida Station, reports the results of extended investigations of the character of guava juice and of the conditions which attend successful jelly making with this fruit. According to his results, a preliminary heating of the fruit is essential, as juice expressed from the raw fruit did not flow readily, and though it gave a light, amber-colored jelly with the proper proportion of sugar, with or without citric acid, yet the characteristic guava flavor was entirely lacking. The juice from heated fruit passes through the filtering cloth more readily than that from raw fruit, and the heating also seems to help in extracting the fruit flavor.

The flavoring quality does not appear to reside in the oil glands of the rind. * * *.

In the boiling of guava jelly some acid (the natural acid of the ripe fruit) is absolutely necessary to change much of the sucrose into invert sugar, and if this does not take place then the sucrose (cane sugar) crystallizes out. Too much acid (and probably too prolonged boiling) seems to make the jelly sticky from the excess of invert sugar, and also to alter the pectin so that it will not gelatinize.

The pink color of guava jelly does not seem to depend on any pink color in the flesh of the fruit, though the white guavas yield a lighter jelly. The depth of color seems to be increased by additional amount of acid, prolonged boiling, and higher temperature at which the boiling is stopped.

The following directions are suggested for making guava jelly:

Cut the guavas in pieces with a sharp spoon (not iron) or with a plated knife. Heat them till quite soft in an enameled or aluminum vessel, with a small amount of water at the bottom, or in a double boiler without water. Put the soft fruit in a strong cloth bag, or folded in a cloth between boards, under a strong press. Measure the hot juice. Heat it in a deep clean pan (leaving room for the extensive frothing), adding a quantity of powdered white sugar equal in bulk to the undiluted juice. When the sugar has dissolved, the hot solution may be filtered through cloth. Boil down until the thermometer in the liquid marks the point which gives jelly of the color and consistency desired, which may be 113° C. (235° F.), or some neighboring temperature. Run the hot liquid into glass jars or into molds. Tough jelly which is not sticky may be satisfactorily packed in shallow ornamental boxes, as is done in Cuba.

Guava juice ferments quickly after it is expressed. According to Professor Belling, when it is desirable to keep the juice for jelly making—

It may be put hot from the press into clean glass bottles or jars immersed to the neck in hot water, which is then kept above 140° F. for half an hour or so. The stoppers, corks, caps, or rubber rings should be heated in the same way and the bottles of juice closed when hot. Such sterilization of the acid juice will obviate the necessity for the addition of chemical preservatives.

At the department of household administration of the University of Chicago Miss Jenny H. Snow studied the effects of sugar and temperature on fruit juices. It was found that "currants, grapes, and plums would jelly without adding sugar, but the product was neiter clear nor palatable and the cost, in the case of the currants, was over a dollar a glass."

Jelly which contained the smaller proportion of sugar (one-half cupful to a cupful of juice) seemed to keep as well as that containing the larger proportion (one cupful of sugar to one of juice).

In the case of apples, the average density of jelly at the boiling point was not far from 30°. With plums it was on an average somewhat lower; with currants it varied from 24 to 28°, being about 27° on an average.

The density at which a good product may be obtained varies with different fruits, but seems to be nearly uniform for each fruit and not affected by the amount of sugar used.

This density was obtained at a lower temperature and in less time with the larger amount of sugar. The smaller the amount of sugar used the longer the period of boiling required and the darker the color of the product.

In each case the smaller the amount of sugar the more pronounced the fruit flavor of the jelly.

Miss Snow also studied the effect of adding sugar to acid fruit before and after cooking. The belief is quite widespread among housekeepers that if sugar is added after fruit is cooked a smaller quantity is required for sweetening than is the case when it is added before cooking. Miss Snow also studied the relative sweetness of cane sugar (the ordinary sugar which is obtained from sugar cane, sugar beets, and the sugar maple) and invert sugar (dextrose and levulose), which are found in nature in fruits, etc., and which can be obtained from cane sugar by inversion, as, for instance, by cooking sugar with acid. According to her results, dextrose is

much less sweet and levulose sweeter than cane sugar, while a mixture of equal parts of dextrose and levulose is sweeter than cane sugar.

When cane sugar was added to apples before cooking and boiled with them, it was found to be largely inverted. When added at the close of the cooking period, it was only slightly inverted, and, although the invert sugar is less sweet than cane sugar, yet "the difference in sweetness between stewed apples when the sugar has been added before and after cooking, respectively, is so slight as to be of little practical consequence.

Overdilution of fruit juice (with water) should be avoided, since this leads to the use of too much sugar; probably the extra boiling thus rendered necessary also impairs the texture of the jelly.

The physical constants of hot juice ready to jelly on cooling are, substantially, boiling point, 103° C., and specific gravity, 1.28.

Jelly is readily made through boiling pectin with acid, water, and sugar.

Jelly making seems to consist in so controlling conditions by means of acid and sugar and boiling as to cause the pectin to be precipitated in a continuous mass throughout the volume allotted to it.

The fall fruits used in these jelly-making studies were covered with cold water, brought to the boiling point, and thoroughly cooked, and the juice allowed to drip through a filter made of a double fold of cheese cloth.

It was found that the pulp remaining on the filter could be again boiled up with water (the least amount possible) and that the resulting juice would make a good jelly. This was particularly true in the case of grapes, even the fourth and fifth extractions making an excellent quality of jelly—a quality better than that made from the first extraction because potassium acid tartrate crystals did not appear in it, as is usual in the case of jelly from grapes.

As previously stated, the presence of acid is considered essential for jelly making and a number of tests were carried on in which citric acid and tartaric acid, i. e., organic acids which occur normally in fruit juices, were used in different proportions.

From the results it appears then that—

Through this addition of an organic acid to a fruit juice containing naturally little acid, jellies can be made if these juices contain pectin. However, the flavor of the fruit is generally changed; the sweet-apple jelly so made tasted much like that made from sour apples, the tartness of course increasing with increasing percentages of acid; the flavor of the pears, in pear jelly, was fairly well preserved, while in peach jelly the peach flavor was completely destroyed. Repeated experiments, varying the percentages of acid, were made in an endeavor to preserve the peach flavor, but success was not attained in this respect, though a jelly of fair texture could be produced. From experiments testing the relative merits of tartaric and citric acids in connection with the use of one or the other to acidify a fruit juice, the balance of favor seemed to be with the former. Both texture and flavor of jellies made by its use were superior to those in which citric acid was used.

These experiments are of special interest in view of the general household practice of adding sour fruit like currants or crab apples to sweet fruits like raspberries or elderberries to make a jelly of good consistency, and the even more common addition of lemon juice to jams and jellies made from a great variety of fruits. When currants or sour apples are thus used, pectin as well as acid is added, while with lemon the improvement in flavor is perhaps the consideration most often in mind, though many housekeepers realize that the lemon juice will make the material "jelly."

According to Miss Goldthwaite—

That so-called jellies can be produced by merely boiling down fruit juices is well known. Naturally the flavor of such a jelly is decidedly fruity, but in texture it is very tough. The making of such jellies requires a large amount of juice, e. g., we found to make one glass of such apple jelly required a volume of juice sufficient for six glasses when made with sugar. Ordinarily, sugar is cheaper than fruit juices, so from the standpoint both of palatability and of economy (possibly also of digestibility) jellies made with sugar are preferable. * * * It seems better not to boil sugar and juice together from start to finish in jelly making, but rather to add the sugar so that it may be boiled with the juice for a period not to exceed one-half the total time of cooking.

Apparently the texture of the jelly may be greatly impaired by excessive cooking of an overdiluted juice.

The investigations summarized above not only furnish the housekeeper with information which is of use in jelly making, but also provide the teacher and student with additional data which is of value in understanding the physical and chemicial problems which underlie this household process.—Bulletin 388, U. S. Dept. Agriculture.

MODERN BUSINESS TRAINING.

In no department of education has the teacher been of more practical service in advancing the prosperity of the people than in the department of business education. The function of the business school is to equip its students for active duties of business life not only as they pertain to accounting, to finance and to commercial office work, but also to the financial, legal and ethical management of all lines of business. Its curriculum is wisely devised to accomplish this result. By its shorthand and typewriting, good penmanship, spelling, grammar, billing, letter writing, the service worth of a young man or woman is increased many fold. Its practical arithmetic, when properly given, is superior to calculus, in commercial affairs. Its ethical teaching and its laws of business, defining contracts, rights, and obligations, commercial paper, agency, partnership, corporations, trusts, etc., are indispensable to every man, whatever may be his vocation, or profession. Its bookkeeping or accounting work, constitutes an educational crown that should be worn by every man, of every occupation.

This accounting knowledge is to the business man what a knowledge of navigation is to the mariner. He is not a safe business man who at all times does not know his debit and credit, his resources and liability, his loss and gain, and his capital or insolvency standing. This knowledge is not inherent in man and can not be determined by any plus or minus quantity. It can only be possessed by a knowledge of accounting which it is the special function of all good business schools to import.—J. H. Jansen, Napa, Cal.

Hay.

Scott, Magner & Miller report:

Receipts of hay here in San Francisco for the week ending todav have amounted to 4400 tons. This is the heaviest amount received so far this season, being an increase of about 40 per cent over last week's arrivals.

Large quantities of hay are now coming by water from the bay and river landings, and will continue from now on through the summer season.

The difficultv that we are at present experiencing in obtaining cars for the loading of hav is a serious consideration, and delays and hampers trade to a large extent, and will probably have an unsatisfactory effect in those sections where this difficulty exists.

The market is practically unchanged, although there is a shade easier feeling along the whole line. A little hay of extra choice quality will sell readily, but the bulk of arrivals being of medium and poorer classes of hay, have not sold to any satisfaction, or moved off into consumption as we should have liked to have seen it.

The market on alfalfa hay is also rather quiet; no large operations appear to be under way, as the demand has not warranted such action up to this time. Considerable alfalfa hay could be shipped from this port, providing prices were at such a basis that we could successfully enter the coast markets.

Deciduous Market

SACRAMENTO, July 23, 1910.

The following circular of the California Fruit Distributors gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, July 22nd.

Peaches.

Two hundred and sixty-eight and three-fourths cars. Twice as many peaches were shipped out this week as last. Varieties now going forward are the best produced in the state—Susquehannas, Wheatland, Late Crawford, Elberta, with a few highly colored clings. Peaches will continue in ample supply for the next ten days and possibly two weeks, but we believe the heaviest shipments have now gone forward. Fruit is of very good quality.

Plums.

One hundred and eighty-five and three-fourths cars. Varieties now available are the same as reported last week. Movement of this fruit has been in excess of our expectations but will continue of considerable volume for but a few days more.

Pears.

Four hundred and sixteen and three-fourths cars. Shipments of this fruit also show a heavy increase. This is caused by several days of unusually warm weather which prevailed during the early part of the week and has hastened picking considerably. Shipments from the River have been better maintained than expected, but are now practically done. The bulk of the crop has been moved from Suisun Valley. It is expected that shipments will materially decrease from this time on.

Grapes.

Fifteen and one-fourth cars. Thompson Seedless grapes are now moving in fair quantities and will be followed by Malagas which are now appearing in a small way. Early Tokays from the Vacaville section are going forward to auction and the first cars of Rose of Peru will move out next week.

Since our last letter we have to report four days of excessively warm weather which has materially effected the grape crop. In some sections a loss as high as 50 per cent has been reported and the damage has now reached a point where it is safe to say that the output will be considerably curtailed. More damage is reported from the early sections than the later ones. It is also reported from Fresno that owing to heat and mildew the output of Thompson Seedless and Malaga will be less than expected. Quality of fruit unaffected by burn, continues very promising, and we do not expect there will be any further damage.

Citrus Market

LOS ANGELES, July 27, 1910.

The orange market is in a very satisfactory condition with in the neighborhood of 1750 cars of Valencias yet to go. Every section shows a satisfactory condition, though it is possible the auctions do not show quite as high an average as last week.

The lemon market is rather stronger than a week or two weeks ago and has every promise of holding satisfactory prices.

Shipments.

Total shipments of citrus fruits to date since November 1, 1909: 27,286 cars, of which 23,394 were oranges and 3,892 were lemons. To same date last season, 33,861 cars, of which 28,674 were oranges and 5,187 lemons.

NEW YORK, Monday, July 25.—Offerings of California oranges were light today and under an active demand the market was strong. There was no material change in prices, though on fancy fruit the figures were a little higher. The hot weather causes an active demand for Sicily lemons from store, and in spite of liberal purchases at recent auctions, stocks in the hands of local distributors are reported to have been closely absorbed. Ten cars of oranges and one car lemons were sold. It was very hot and sultry.

GOOD PRICE FOR ALMONDS.

The California Almond Growers Exchange is just sending out Bulletin No. 8 in which it refers to a 13, 14 and 15 cent offer for Ne Plus Ultra, I. X. L. and Nonpareil. This was two cents higher than was paid to any grower prior to July 1st, and we doubt not may be explained by the fact that the association through its manager, J. P. Dargitz, has been securing not only from all sections of California, but from European points, figures as to output of almonds. The circular adds:

"Boston reports all offerings of almonds withdrawn for the present That means the holders look for a rising market.

"New York reports an anticipated advance on Tarragonas of ½c to 1c a pound.

"Bordeaux, France, reports walnut crop badly damaged. This will help all the nut markets.

"Chicago reports that they are unable at present to get any of the Pacific Coast operators to quote them a price on almonds. Do they, also, look for a rising market?

'One San Francisco firm has asked for all our almonds, of varieties less than 5 tons each, to be used for shelling. But we have already sold that class of goods to be shelled."

This association is accomplishing much for its members, and this is only one more proof of what other producers should imitate. Just at this time the apricot growers of Orange county are urging every apricot grower who has information on the apricot output, to send estimates and probable prices in every section of the state.

POULTRY FOR GRASSHOPPERS.

Perhaps we are neglecting the readiest means of mastering this pest in trying to find some new remedy. Perhaps, where a large crop is threatened, the remedy we suggest might not be effective, but we believe the chickens and the turkeys, if properly handled, would in a large measure take care of the grasshoppers. So long as we feed the fowls liberally about the buildings, they will not forage much or far from the feeding place; but if movable colony houses were provided, and placed in the fields, and the fowls were fed very little, and that feed scattered broadcast over a large acreage, making the fowls hunt for it, they would very largely take care of the hoppers. This should be done at the very first appearance of the hoppers in order to keep down the increase as largely as possible, and it is astonishing to see how many gallons of hoppers a hundred chicks or turkeys can dispose of in one day. No feed should be given in the morning so they will be more ready to forage.

We have always advised disposing of chicks with the exception of those meant for breeders for the next season, just as soon as they are large enough to market, as the prices later in the season will not pay for the increased weight. But with the great damage being done by grasshoppers we believe a farmer will make a mistake by selling his poultry until this pest is disposed of. If we had a specially valuable garden crop, we would surely protect it by this means, even if we had to buy poultry and had to herd them during part of the day.—W. E. Vaplon, Colorado Agricultural College.

KNOW YOUR BUSINESS.

Education to be of the highest value in its application to almost any calling must be practical, and this is especially so with bees, therefore, as soon as the first general knowledge has been acquired the prospective beekeeper should buy two or three colonies of bees and learn to handle them while continuing his reading and study of the subject. He will find that many of the theories he may approve on the subject will fail in practice. His judgment needs to be trained by actual practice with bees. He must acquire skill in handling them, and above all, he must get actual acquaintance with the bees and their habits and ways of doing things. He will acquire skill in diverting the bees from unprofitable to more profitable lines of work so that the bees as his servants, will put in all their time in such lines as he may lay out for them.

Those who have seen Miss Cecilia Beaux's home, "Green Alley," on Gloucester Point, count it rarely lovely. Miss Hildegarde Hawthorne has written of this beautiful "Garden of the Heart" for the August Century, a garden where "Nature is trusted, and perfectly mated to art and human necessity."

The Smooth Running Pomona Deep Well Pump

RELIABILITY.

Has passed through another most successful season's run, this being the fifth since starting.

There is no experiment in buying a POMONA PUMP. All the parts have been tried out and fully perfected. They will do the work we know and do it well.

We have records of plants that have made three season's run without one cent for repairs of any kind.

ECONOMY.

May be driven by a steam engine, gas engine or electric motor and in any case will give you the cheapest water and pay dividends on your stock.

Any Water Company going into the Irrigation business will run no chances in buying the POMONA PUMP. They are built heavy and strong. All the wearing parts are Bronze Bushed or Babbited and will last a life time with the smallest outlay for repairs.

We can refer you to customers who are operating their POMONA PUMPS for less than one-half cent per inch per hour on 200 feet lift. This is less than half what their water costs with other pumps. The same make of engine being used in both cases.

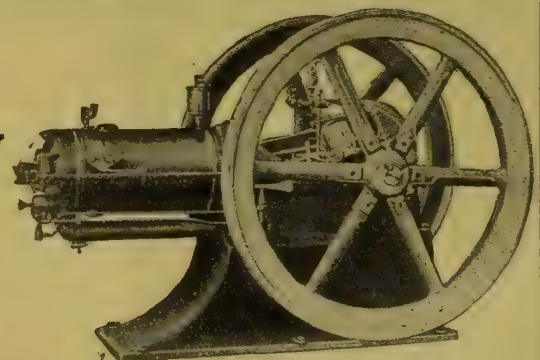
R & V-- Gregory Engine

4 to 35 H. P.



When you are about to buy an engine for **any purpose** the first thing that comes to you is: "Now, what kind of an engine shall I buy?" After looking them all over you cannot help but say Gregory's engine is the one, the R. & V. Why? Because it is the best workmanship, best material used, the most economical, the easiest to start, no turning fly wheels, and the very best thing for the money. The same thing applies to all the different kinds of pumping machinery sold at our store. Send for description, or, better still, come and see us.

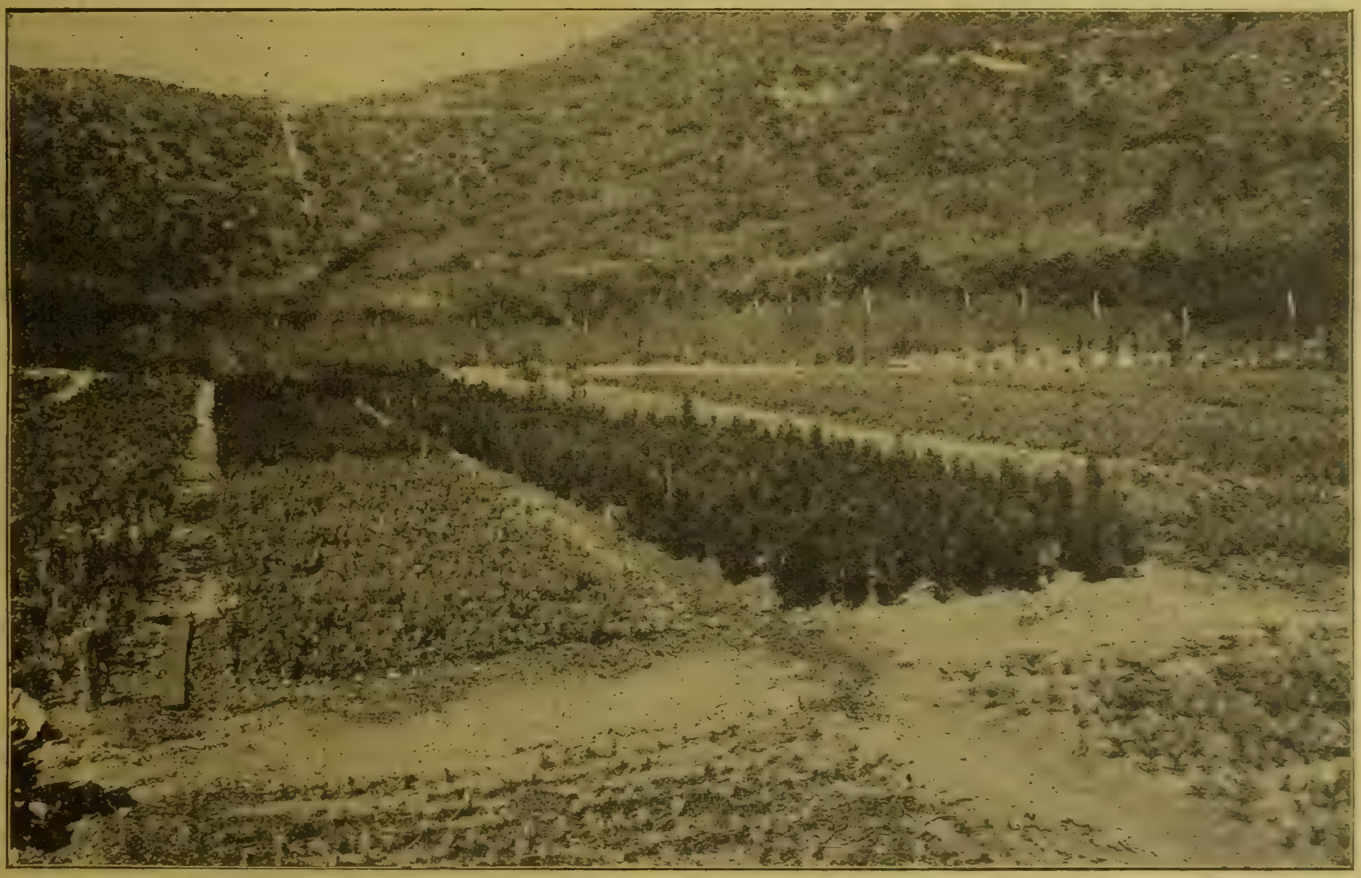
Ten Tons of Forest Tree Seed Each Year



THE U. S. DEPARTMENT of Agriculture is using this year on the National Forests over ten tons of tree seed. Most of this seed has already been planted or sown. The rest will be utilized later in the season, as favorable conditions are presented.

It takes a great many tree seeds to make ten tons. Jack pine, the most important tree for planting in the Nebraska sand hills by the Forest Service, will average something like 125,000 to the pound. Of Western yellow pine, the tree most extensively planted throughout the National Forests as a whole, 10,000 seed will make a pound. Altogether the ten tons of seed to be used this year represent perhaps 300 million single seeds.

If every seed could be depended on to produce a young tree suitable for planting, the result would be a supply of nursery stock sufficient to plant three hundred thousand acres of land, but no such result can be looked for because many seeds do not germinate. Most of the seed will be sown, either broadcast or in seed spots, or planted with a corn-planter, directly in the place where the trees are to stand.

Even when nursery stock is raised as in above scene in California, a liberal allowance must be made for loss. In the first place, a considerable percentage of the seed will be found to be infertile. If from a pound of Western yellow pine seed that contains 10,000 individual seeds, 4,000 three-year-old transplants are available for field planting, the Department of Agriculture has obtained satisfactory results.

There are now twenty-four National Forest nurseries with an annual productive capacity of over eight million seedlings. But there are many millions of old burns on the National Forests which are waiting to be restocked, and some quicker and cheaper method than the actual planting of nursery-grown trees is urgently needed. Therefore the foresters are making experiments on a large scale with different methods of direct sowing and planting, and most of the seed gathered last year was obtained for this use.

BEST FOR DEEP WELLS AND IRRIGATION WORK

Operate with Less Power, Less Atttention and Fewer Repairs than any other method

The cut shown is the Luitwieler Heart-shaped Cam, and the only reciprocating pumping mechanism with uniform application of power throughout the full stroke and uniform speed of the water pistons or plungers.

This enables successful direct geared drive, which we furnish, and particularly, our self-contained electric pumps fill a long-felt want.

We also furnish direct geared steam and distillate drive when desired.

The uniform application of power also insures long life of working parts; freedom from break-downs; continuous flow; no jar; no noise; no pit; no bother.

Pumping against a steady pressure.

Thirty-two years experience in Los Angeles with pumps and irrigation.

"Flour City"

Gasoline Traction Engines

Made in 30 and 40 H. P.

Gold Medal Winner

1908 and 1909

The "Flour City" 4-cylinder engine was entered in the International Motor Contest at Winnipeg, in July, 1908, in competition with the leading engines manufactured in this country and England and was awarded first prize—a gold medal—for plowing more land and hauling a greater load in a given time, with less water and fuel consumption, than any of it competitors. It was again entered in 1910 and and again carried off first prize.

This should be convincing evidence to prospective purchasers that the "Flour City" 4-cylinder engine is the best

We have two of these engines on the road now from the factory which should be with us by August 10th. One of these engines is sold in advance of arrival, the other will be ready for inspection as soon as unloaded.

Be sure and see the "Flour City" gasoline traction engine before buying.

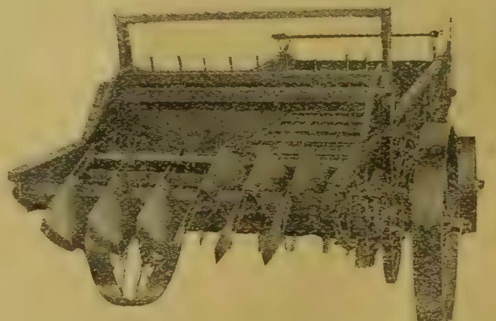
The New Idea



Just the thing that every farmer and orchardist has been looking for for years — a real Manure **Spreader** — not simply an unloader. That is why the

New Idea Spreader

takes the lead.

Why?

Because—

It will absolutely pulverize hard substances better. Gives wider and evener spreading of any class of fertilizer. Less weight. Lighter draft. Absolutely gearless, no cogs or bevel gears. Its simplicity insures less breakage. Low down and easy to load. Only perfect endless conveyor that cannot race or slip, and needs no cranking back for re-loading. Better construction and longer life. Strongest wheels, both front and rear tracking with standard wagons. Load evenly carried on both axles. Double cylinders with Pointed Teeth, preventing choking and bunching, and the Widest Range of Feed.

By removing two bolts and taking off bed you have the best farm truck on earth.

Illustrated and descriptive catalog on request. Demonstrations to responsible parties.

Our Horticultural Influence on the Nursery Business

An Address Delivered Before the National Nurserymen's Convention at Denver, June 24, by GEORGE C. ROEDING of Fresno, California

CALIFORNIA—what is her charm? As a native son I can only say that she possesses an attraction so strong that no matter what part of the world one visits, the name winds itself around your heart strings and the old saying, "once a Californian always one," is applicable not only to the settler who has come from distant shores and made California his home for a few years, but also to the native born, who always has a tender spot in his heart for his magnificent state.

Little did the early settlers, who came here during the gold excitement of '49, realize what magnificent opportunities were hidden away in the surface soil, requiring only to be tickled by the thrifty husbandman, to bring forth resources which would develop into proportions far exceeding in annual production, and increasing with each succeeding year, the most sanguine expectations of the miners who delved in the bowels of the earth for gold.

The possibilities of agricultural and horticultural pursuits were not fully appreciated until fully twenty years after the discovery of gold, and then only in a modest way. That this state, would eventually develop into the greatest horticultural state in the Union and that in a short period of forty years, it would demonstrate that its people were further advanced in modern methods of cultivation, pruning, handling, packing and marketing of fruits, both in the fresh and dried state, and in the successful combating of pests, is now conceded by the civilized world.

Facts cannot be contradicted, and to say that California is a veritable empire, with a greater diversity of soils and climates than may be found in any other country, is no exaggeration. To be sure this is a broad statement, but it is substantiated by the great variety of fruits produced commercially, which would not be grown on so large a scale were conditions not favorable for their successful and profitable culture.

To further comprehend what California is, allow me to say that it has a coast line, the Pacific Ocean forming its western boundary, 1200 miles in length, with an average width of 200 miles and an average length of 800 miles, bounded on the east by the snow capped Sierra Nevada Mountains, ranging in height from 10,000 to 14,000 feet, and covered the year around on the higher elevations with snow, ice and ancient glaciers, which supply the fertile valley lands below with a beautiful supply of water for irrigation purposes, the development of hydro-electric power, sufficient for turning the wheels of industry which will also furnish ample power for years to come.

Aligning the coast is a lesser range of mountains, known as the Coast Range, uniting with the Sierras in the north at the high peak of Shasta, and in the south across the Tehachapi, forming a mountain wall around the great interior valleys known as the Sacramento and San Joaquin, which have an average length of 450 miles and a width varying from 40 to 100 miles. In the Coast Range Mountains are numerous smaller valleys, all of which bear an important significance on the horticultural development of the state.

It is estimated that the state contains 160,000 square miles of territory, that the mountains and deserts cover some 60,000,000 acres of land where cultivation cannot reach, and that there are 40,000,000 acres adapted to intensive cultivation. Of this vast tract a comparatively small area is devoted to horticultural products. Although our fruit interests have expanded by leaps and bounds in the last two decades, the industry has not yet passed beyond the infantile stage and the possibilities which lie before us, I hesitate to dwell on too freely, for fear I might be termed an optimistic dreamer. Some idea of what has taken place in this short period, may be gleaned from the following: In 1873, 120,000 pounds of raisins were produced in California, and by 1884, the production had increased to 103,000,000 pounds, in1908 to 130,000,000. In 1872, the interstate shipments of fresh deciduous fruits were practically nothing, in 1894, they approximately amounted to 5000 cars of ten tons each and for the season ending 1909, 15,265 carloads.

Oranges, lemons, pomelos, classed under the head of citrus fruits, have in spite of the astounding increase in production, found a ready market in all of the states of the Union, and shipments of no small magnitude are being made to foreign countries. In 1890, the total shipments of citrus fruits, and these were confined to practically two counties, Los Angeles and San Bernardino, amounted to 2500 carloads. In 1894 and '95, they had increased to 7575 carloads; the rather slow increase in the output was due to the ravages of the Cottony Cushion scale (Icerya purchasii) which was rapidly destroying the trees, and had it not been for the introduction of the predaceous insect, Vedalia cardinalis, the citrus industry would have been wiped out of existence. In the season of 1908-09, the shipments of citrus fruits had reached a grand total of 40,592 carloads, bringing in returns of something over $30,000,000. Further statistics, illustrating the wonderful strides which have been made in all lines of fruit production, might be mentioned, but this would occupy too much of your valuable time, and I merely wish to close my statement on this subject by saying that the output of orchard and vineyard products for 1909 was $95,012,747.

Historically California horticulture owes its inception to the Franciscan Fathers, who established their picturesque Missions as far back as the year 1769, and who imported from points in southern Europe, figs, olives, oranges, date palms and European grapes as well as many other varieties of fruits, all of which found congenial conditions to their perfect development in their new home; and even to this day many of these fruits are regarded as among our best types, thus demonstrating the high order of intelligence possessed by these early settlers. It is due to their early efforts that the thoughts of a few of the '49'ers were turned from the quest of gold, to the cultivation of the soil, which prompted the planting in a limited way of orchards and vineyards. These initial steps toward horticultural progress created a demand for other varieties of fruits, hence such nurserymen as John Rock and B. S. Fox of San Jose, James Shinn of Niles, and W. B. West of Stockton started into the nursery business in the early fifties. All of these men made a decided impression on California horticulture, and although they have passed to the great beyond, I would feel that I was lacking in fealty, were I not to say a few words in their honor. It is largely due to their efforts in the introduction of, and testing of the many varieties of fruits from Asia, Europe and the eastern states, that California's horticultural interests were established on so firm and solid a basis.

I was fortunate in knowing all of these men, but was more intimately acquainted with John Rock, and as he outlived his contemporaries by many years, his scope of usefulness covered a much wider field. He was inclined to be somewhat taciturn and never had much to say of his achievements in horticulture, but it was entirely due to his untiring energy that so many valuable fruits and ornamental plants were imported from all parts of the world. His trial grounds at San Jose were a feature of his nursery and in 1884, when he started the California Nursery Company at Niles, his testing grounds were laid out on even a more elaborate scale and they stand today as a monument to his patriotic zeal to promote horticulture along legitimate lines. He was indeed the horticultural seer among our pioneer nurserymen, and introduced more valuable varieties of trees and plants, which have found congenial conditions for their successful culture, than any other one man. He possessed such a fund of knowledge and a student's inclination for careful investigation, that had he felt inclined, he could have written reports which would have proved valuable annals to the early horticultural history of this state.

B. S. Fox has indelibly affixed his name as a great horticulturist by his originating such varieties of pears as B. S. Fox, Colonel Wilder and P. Barry.

James Shinn and W. B. West, conducted nurseries which were a credit to themselves as well as to the communities in which they lived, and it can be truthfully said, that the succeeding generation of nurserymen and fruit growers owes a debt of gratitude to these men for having blazed the way for the striking and astonishing progress which California has made in her horticultural resources.

The important part which California plays in the horticultural world is illustrated by the fact that we grow every variety of fruit known to the temperate zone, and that our dried fruits not only find a ready market throughout the United States, but shipments are being made in ever increasing quantities to the European countries in which many of these fruits originated. Our production of dried fruits and raisins exceeds the production of all the other states in the Union put together.

In semi-tropical fruits, the citrus fruits take the lead, followed in importance by the fig, olive, persimmon, loquat, pomegranate, jujube, date, guava and of strictly tropical fruits, which have a promising future, might be mentioned the alligator pear (Persea gratissima.) The banana and pineapple, have been grown in favored localities, but there is no probability of their ever being grown on a commercial scale, as there are too many other places like Mexico and the Hawaiian Islands adapted to their successful culture, under much more favorable conditions. California markets annually 10,000 tons of almonds

Citrus and Sub-Tropical Fruits

FUMIGATION.

AT the special meeting of the Claremont Pomological Club recently held at Pomona, a paper on Fumigation by Elmer H. Sellers gave methods of work at the Arlington Heights orchards. Mr Sellers is foreman of the fumigation work and his success has been marked. From his paper we quote:

During the past four seasons that we have conducted our own fumigation there have been treated in the company's own groves about 210,500 trees at a cost of over $50,500, averaging about twenty-four cents per tree, large or small, and about the same acreage of private orchards, and the result is clean fruit and clean trees with no expenses whatever for fruit scrubbing in the packing houses and consequent bruising of it to lessen its market value. There is great satisfaction all around and we have found out that intelligent and conscientious and up-to-date fumigation pays, pays well, pays a hundred fold in the way of tangible rewards and results.

But fighting insect pests, whether by fumigation or other means, is expensive and the plaint is put forth that the citrus industry can hardly stand this extra tax for pest eradication, more so if it is to be a continuous performance from year to year.

Very well, it takes no very great foresight to preceive that any negligence to rout these scale encroachments now will increase expenses for that purpose to such an extent as to make this splendidly developed citrus industry sadly languish and so to speak be a monument to stupidity and carelessness.

The question now comes up if an orchard is once made clean of scale insects, how long will it stay in such condition, or will there have to be a frequently recurrent heavy outlay of money and trouble to keep it clean?

That has now become our problem. Many sections of the company's properties show signs of re-infestations from such scales as were once eradicated by fumigation and original infestations are appearing in orchards where they were never found before.

Why?

It is now well known and understood that winds are the main agency for spreading these insects to new quarters, though many other factors help to do the same.

Invariably and without exception we find our newly infested and re-infested sections to be in the path of prevailing winds, blowing from the direction of orchards which are more or less in the neighborhood and are more or less infested with scale, and which have never yet been fumigated, or, from orchards in which cheap and inefficient means were used for scale eradication, or from groves which have been re-reinfested for the same reasons.

As I have said it is one of my duties as foreman not only to expedite the mechanical or operative part of fumigation, which has now become a comparatively easy matter, but to study the larger economical side of scale re-infestation and its possible decrease.

The slogan now is: How can expenses for scale eradication be materially reduced if fumigation must be resorted to to conserve the fruit and trees?

Orchards from which our re-infestations emanate are not under our jurisdiction, being controlled by other owners and until they are clean of scale, re-infestation will simply be of regular and continual recurrence. Had such orchards been cleaned up when ours were, expenses for elimination of scale re-infestation would practically be nil, as orchards fumigated three and four years and not exposed to infested orchards have had no fumigation expenses charged against them.

Fumigating such groves only of enterprising and willing owners and leaving those of unclean or unwilling persons in the neighborhood or allowing groves to be only partially and imperfectly cleaned up by cheap methods is only temporizing with the reduction of scales and expenses for such; it may help the matter some but does not eliminate anything.

Fumigation, as we all too well know, is expensive; many claim they cannot, or rather, will not, afford it, and as long as the fruit from their infested areas is readily accepted by the packing houses no thorough cleaning up will be attempted unless they are compelled to do so by the powers that be, which is a tedious, disagreeable and unsatisfactory process.

A scale infested orchard among clean ones is a public nuisance and menace; it brings unnecessary expense and damage to neighbors and is a decided drawback and detriment to the citrus inustry and must be made harmless.

This matter of scale eradication and control would seem really simple if co-operation and concerted action were brought to bear upon any recusant parties. Your most worthy horticultural commissioners' duties are to show you how best to overcome insect pest spoliation which spells so much financial loss to you. But they are badly handicapped in their work when not all and every one interested and concerned in this matter extends a helping hand to them.

The scales which are now engaging our attention so much have most intricate and pervasive ways of spreading and floating into everybody's trees, rich and poor alike, at all times of the year; they are endowed with most remarkable facilities for quick and frequent propagation and then develop quite admirable staying qualities, yet homesickness seems to be one of their vices, for they dearly love to return quite often to scenes of former activities. Before all trees can be cleaned up they are round again like the proverbial beggar at the back door.

We know now, thanks to the investigations of Mr. Woglum and others, that with the latest methods of scientific fumigation with hydrocyanic acid gas we can eradicate or kill scale on a given tree with practical certainty. Therefore, it seems, all we have to do is simply to cover all our trees with tents and make the proper dosage of gas under them and

we have it. Very simple, is it not? Let us all go right off and do it. If one tree can thus be cleaned up, surely, many hundred thousand trees can also be thus cleaned. We thought so once, but we know better now. The trouble is the trees do not stay clean and free from scale.

Reinfestation plays its part—a most important part—in the economy of scale control as explained before.

This matter of scale eradication and control then rests upon up-to-date, compulsory, wholesale fumigation by districts by co-operative communities. Many more fumigation outfits must be in commission under competent surveillance and intelligent direction. Every thousand acres, or so, should have its own set of tents and apparatus. Such fumigation districts should be mapped out with a view to a solid, contiguous and adjoining mass of acreage with no breaks in it whatever that would be neglected and thus become new distributing sources for reinfestation. Such districts should be attacked first on the prevailing windward side and nothing should be given the go-by, unless irrigation temporarily interferes.

During this mass fumigation trees in groves treated should be thoroughly examined for possible reinfestations not later than twelve months after fumigation and the first sporadic sign of scale appearance should be immediately attended to to prevent any freshly hatched scale from starting on a journey to other trees and groves. All fruit picked should be examined by those in charge for any signs of scale as much as can be done and reported. We are doing this in our own groves and pruners are also instructed to report any scale signs coming across their notice. We also do considerable inspection in the lemon orchards ourselves, as scale is far more rampant in such than they are in orange trees.

The more fumigation outfits that are in proper and honest operation, the more scale will be killed off at one time; the more scale there is destroyed so much less propagation and spreading out again follows and, consequently less trouble and less expense. Any reasonably intelligent fruit grower can figure out from this proposition a possible millennium ahead; if he is not progressive enough to be reasonably intelligent he has no business to be the owner of a single tree.

We must have clean orchards; clean orchards mean progress, financial progress, which is, as I understand it, a consummation devoutly prayed and yearned for by all good citrus growers and some others not so good.

IMPORTANCE OF ORANGE TREE PRUNING.

Prof. Wickson, whose letter of approval of the principle and method of practice in pruning old orange trees, of which I wrote in your issues of May 26 and June 16 and 30, I herewith enclose, has been kind enough to accede to my request that he permit its publication.

While I personally appreciate the hearty support of the foremost authority in horticulture on the Pacific Coast, I feel that it is proper and incumbent on me to call attention to his views on this subject which he considers "one of the most important matters that has ever been announced in connection with our citrus industry," that my fellow-growers may investigate and practice what will surely be one of the means of renewing decadent orchards.

It is surely time for scientists and practical men to consult on a subject of so great importance.—Chas. R. Paine, Redlands.

Prof. Wickson's letter to Mr. Paine is as follows:

"I am exceedingly glad to have your letter of July 9th and the articles from the California Cultivator which you kindly send me. I have known for a long time that you were pursuing the rational process of treating old orange trees which you describe in these articles. It seems to me that it is one of the most important matters that has ever been announced in connection with our citrus industry. It is particularly true in principle, and if intelligently introduced into practice would bring all our old trees into a condition of superior thrift and promote the production of better fruit. The idea of allowing these old trees to become dark, weak, and unproductive in the center, is irrational and reflects no credit upon our pomological energy and intelligence. You cannot de better than to contend for the recognition of the treatment which you have demonstrated, and get as many people as possible to study the trees which you are handling by your method. It is not only rational as applied to citrus trees, but the principle holds in the treatment of nearly all our old fruit trees to the extent warranted by their nature, manner of growth, etc."

SATSUMA ORANGE.

Touching upon the planting of the Satsuma orange in many Southern Gulf sections, Coleman's Rural remarks:

The Satsuma orange, one of the mandarin class, introduced from Japan, is the earliest and at the same time one of the hardiest oranges grown. Owing to these qualities, it is gaining considerable popularity in the South. But one peculiarity of the Satsuma orange is that it is worthless as a fruit bearer unless grafted or budded on Trifoliate orange stock.

Sour orange and sweet orange have been generally used as stocks by growers of citrus fruits in the South, and during recent years the hardy Trifoliate orange of China and Japan has come into prominence as a stock. For soils to which it is adapted it may be used with excellent success, but it is not adapted to light sandy soils. It has been found in practice that certain citrus varieties behave differently when grafted on stocks of different species. This is particularly true of the Satsuma orange. Grafted on sweet or sour orange stock it is worthless, while on Trifoliate stock it succeeds admirably. As the Trifoliate stock is adapted only to fairly rich moist soils, the mistake is sometimes made of using the other stocks named with a view to growing Satsuma oranges on light sandy soils. Some nurserymen have grafted Satsuma orange scions on sour orange stock and are now offering them for sale. In order to warn growers against a serious mistake, the United States Department of Agriculture has issued a circular prepared by Walter T. Swingle. Mr. Swingle says: "It is no exaggeration to say that he who plants a Satsuma orange tree grafted on sour stock might better bury a five-dollar bill and burn the tree, which, if planted, will linger along for years, only to be finally dug up as worthless." He tells how the intending purchaser can distinguish between the Trifoliate and the sour-orange stock, and offers the assistance of the Department to those who desire to make sure they are not deceived.

Notice to Orange Growers

The undersigned having developed a process, in connection with their proved Bartlett Canner, in which a delicious product of Canned Oranges is obtained, are now enabled to furnish complete plants at small cost in which culls may be used as well as the more perfectly formed fruit.

The process is simple as A B C and the product will go to the eastern markets in train loads when better known, and within reach of everybody in price where the orange is always a luxury.

Hundreds of people in Los Angeles have eaten our Canned Orange with nothing but praise for it, and as it is put up in a heavy, rich, palatable syrup it pleases all.

No question about there being a market for the Canned product, nor of its immense value to the orange grower.

Here is a market for what is now a by-product, or for something having no real value—orange culls.

Terms and demonstrations at our office will be cheerfully made, and to be ready for coming season no time should be lost.

We absolutely guarantee perfect working of the plants, and will furnish to buyers license to operate, as well as instructions for successfully canning oranges that will keep, that will please, and that will sell at a big profit.

What more is required?

Deciduous Fruit Culture

TESTS OF PHYLLOXERA—RESISTANT VINES.

A COMPREHENSIVE series of tests of resistant vines was commenced at the University Farm, Davis, during the autumn of 1909. They consisted principally in the bench grafting of a large number of our common and promising Californian vinifera varieties of grapes on a number of the usual and most promising resistant varieties.

These grafts were planted in nursery where they were being rooted and next year the rooted grafts will be transplanted to ten-acre blocks at Davis and at Fresno, where they will be grown in vineyard form to continue and complete the tests.

The main object of the tests is to determine what are the best stocks for the conditions of soil, climate, and variety in California. They include several series having somewhat different phases of the problem in view.

One series consists of 13 varieties of vinifera, including the table and wine grapes which have shown themselves the most valuable for the different regions of California, grafted on eight varieties of resistants which have shown the most promise of suitability for the same region.

Another series consists of six varieties of vinifera, viz., Burger, Zinfandel, Muscat, Emperor, Cornichon and Sultanina, each grafted on 17 varieties of resistant stock. These vinifera varieties are all of great importance in California and the need of knowing the best stock for each is very pressing.

Another series is especially devoted to the testing of raisin grapes which have been grafted on 10 of the most promising resistants.

For the purposes of these tests, a grafting house, a nursery and a vineyard have been established at the University Farm, where they are available for the inspection of all interested.

During the coming autumn it is proposed to graft a large number of vines in order to give students instruction and practice in the various operations of grafting, callusing and nursery work. Especial attention will be given to the method which was used with excellent results in the work last year of callusing in moss in a warm room.

BE KIND TO THE TOAD.

A pamphlet recently issued by Secretary Wilson, of the Department of Agriculture, pays a glowing tribute to the toad. According to this high authority, few creatures of its size have suffered more from false witnesses. It is not true that it causes warts, poisons infants or spoils cows' milk. On the contrary, it has an amiable disposition, a good singing voice—for those who like that sort of thing—and, above all, most commendable industry.

An able-bodied toad eats $19.44 (wholesale rates) worth of injurious worms and insects every season. It is a most efficient ultimate consumer, and it likes best those things which the farmer likes least. It is home-loving and very fond of children—its own children. No farmer or suburbanite should try to get along without a couple of good toads.—Globe-Democrat.

WEEDS!

Did you ever stop to think of the tax you are paying to keep up the weed crop? If the State should levy a tax on your crops, equal to 25 per cent of the value, you would rebel in righteous indignation. Wouldn't you? Yet a good many of us permit a stand of 25 per cent of weeds to occupy our fields and think we are doing pretty good farming too.

Why not grow grain or alfalfa, or sugar beets or spuds, or some other good crop where that weed tax is now growing? The weeds give no return. They draw more heavily on the water supply and plant food supply than paying crops. Paying crops and weeds cannot occupy land at the same time. Let us grow paying crops and get profits rather than pay taxes.

Pound for pound, the plant food required by crops and by weeds is almost the same, but weeds are better food gatherers. The greatest difference comes when the question of water arises. Weeds not only require more water but are able to get it. From 300 to 700 pounds of water are used in producing a pound of dry matter in our common crops. Weeds require even more. If it comes to a contest as to which will get it, the weeds win.

Reform the weed.—Alvin Keyser, Colorado Agricultural College.

WANTED—FARMERS.

Uncle Sam is looking for 500 practical farmers who would like to own homes of their own. The Government now has about five hundred farms awaiting settlement under the various irrigation projects in the Northwest. These farms vary in size from 20 to 80 acres of irrigable land, depending upon location. In many sections a tract of grazing land has been included in the farm unit, bringing the total up to 160 acres.

There is no drawing or any element of chance in applying for one of these farms. It is only necessary to make a homestead entry at the local Land Office. The farms are free to every bona fide homeseeker who is entitled to make a homestead entry, the only charge besides the regular land office fee for filing being the actual cost of getting water to the land. Payment may be made in ten annual installments, without interest.

Owing to the rapidly diminishing area of unoccupied public domain, opportunities to secure desirable farm land are becoming more rare each year, and it is doubtful whether the present favorable conditions will ever occur again.

The farms now awaiting settlement include a wide variety of soil and climate. If you desire to engage in general farming, or to specialize in the growing of apples, alfalfa, sugar beets, garden truck, stock raising, dairying, raising poultry; or if you are a professional or business man and wish to locate in a new town in a growing agricultural community, write to the Statistician of the United States Reclamation Service, Washington, D. C.

The hot spell did much damage to alfalfa near Yuma.

HORTICULTURAL INFLUENCE.

(Continued from Page 99.)

and walnuts and this promises to be supplemented before many years by the pecan, which thrives very well indeed in moist locations in the interior valleys. Experiments extending over a period of years have demonstrated the adaptation of the paper shell pecans, and I predict that inside of twenty years the culture of this nut will be one of our important industries. The pistachio or green almond, so extensively grown in the countries aligning the Mediterranean, is another nut which will do well in the interior, its value to be eaten out of hand and for the manufacture of the famous pistachio candy will cause it to be extensively planted. The chestnut and filbert are well adapted to our coast counties and only wait the demand to encourage them to be planted. Our wine and brandy production is expressed in figures of almost 50,000,000 gallons annually. The fact that we grow the identical varieties of grapes that are raised in Europe, accounts for the demand which is largely from the foreign residents for this product. It is not necessary for me to dwell on the fact that the adaptation to our soils and climate of such a great variety of fruits, has in the natural course of events drawn not only on the nurseries of this state, but also those of outside states to meet the demand.

In many respects the nursery business in California is conducted on an entirely different basis from that in any other section of the United States. Once one of your leading nurserymen from the East, while on a visit to California, made the remark; "People in your state buy trees because they want them, while with us in most cases we actually force them to engage in the fruit business." The fact that California is engaged in fruit growing on a commercial basis has created a call for varieties, many of which have become standardized because they possessed merits which caused them to be in demand either for shipping, canning or drying. Another strange feature about the trade in California is that the wholesaling of nursery stock has never assumed any magnitude, largely because the purchasers of trees were insistent on knowing by whom the trees were grown and in some cases would even demand to know where the buds were taken before they would buy. The sale, for practically all the trees grown, is confined to the state, and this makes the business all the more hazardous, because if trees one year old from the bud are unsold at the close of the season, they are invariably placed on a brush pile for fuel purposes. It is simply beyond calculation for a nurseryman to know in advance what class of stock to grow, because the demand is confined to the varieties of fruit which sold at the highest prices during the previous season.

Whenever the shortage of peach trees, as an illustration, becomes acute, orders immediately commence to pour into eastern nurseries, but it usually happened that they could not supply the varieties and this, of course, was a decided disadvantage; hence it is only natural for the nurserymen to infer that there was a demand which must be met; they therefore secured buds of leading varieties from California, and finally, after having a good stock of these to offer, sales lapsed for some unknown cause. To illustrate why this occurs, I wish to say that I have known years where cling peaches could not be sold to a grower at $80.00 per thousand, and the very next season, because the canneries were paying top prices for this variety, planters would willingly pay $250 to $275 per thousand for the very same trees which the year before they would not be induced to buy at any price.

The commercial aspect of the business has made it necessary to secure buds from bearing trees, which were in many cases infested with insect pests, making it obligatory for a nurseryman, in order to protect his interests, to wash and fumigate all of his buds, scions and cuttings. Even with all of these precautions, our horticultural laws with every succeeding year have been increasing in severity so that it has finally come to the point that ordinances have been passed that positively prevent the shipment of certain classes of stock, regardless of how clean it may be, between neighboring counties.

At this point I wish to remark that the nurserymen in the middle west and eastern states, have at times been of the opinion that the California nurserymen were at the bottom of all the laws which prohibited the importation of nursery stock from other states. This is entirely incorrect. To prove it, I wish to quote briefly from a paper read by me before the Fruit Growers Convention in Hanford, December, 1908: "Is it right and just when stock from outside sources is brought in without any apparent restriction, to enforce ordinances which arbitrarily prohibit the shipment of stock between counties without inspection? This comparison is made to show how much more difficult it is for a nurseryman to conduct business in his own state, than it is for those whose interests are not so closely united." I do not wish to be misunderstood in this matter, for I am in favor of our horticultural laws being enforced, in so far as they are based on common sense principles, but when an imaginary line is drawn preventing the shipment of nursery stock without inspection because a pest may be known to exist in a certain county, then it is high time for the nurserymen to act as a unit and fight all such obnoxious measures. The necessity for careful and painstaking work on the part of our horticultural officers, however, is imperative, when it is borne in mind that $250,000 is paid out annually in Los Angeles and neighboring counties alone for fumigating citrus trees.

In conclusion, I want to say a few words in honor of that distinguished plant breeder Luther Burbank. A more sincere personality, it is hard to imagine; at once difident and shy, he is nevertheless one of the giants in his chosen field. As most of you know, the scientific temperament is hardly adapted to business, For this reason it is not fair to measure a man like Burbank along ordinary lines. I have been reasonably familiar with his work for years and can assure you that it rests on solid ground; the results will justify the statement that as a stimulating force in the study of plant life, there is no name, in the annals of modern horticulture, that has caused so wide a discussion in fruit, nor one who has more forcibly directed the possibilities in the betterment of our fruits and flowers.

The New Jersey station reports that the average yield per annum of green clover to the acre is 14,000 pounds, and of green alfalfa 36,500 pounds; the protein in the clover is 616 pounds and in the alfalfa, 2214 pounds; one ton of alfalfa has 265 pounds of protein, and clover only 246 pounds. But alfalfa will produce three, four, or more cuttings each year, while clover will produce one or at most two. Further, clover will ordinarily survive but two years, while alfalfa will last from ten to one hundred, thus saving many plowings and seedings. It is also estimated that the stubble and root-growth of alfalfa are worth at least four times as much for humus as are those of clover, while the mechanical and other beneficent effects of the long alfalfa roots far excel those of clover. The alfalfa field is green for pasturage a month earlier in the spring than clover and may be mowed a month earlier. It starts a vigorous growth at once after cutting, covering the ground with its luxuriant foliage.—From Coburn's "The Book of Alfalfa."

As land values increase and the farmers and dairymen come to more fully appreciate the worth of green feed in winter, the silo grows in estimation. Eastern farmers who keep cows or young stock of any kind use the silo more or less, to conserve for winter the value of both green grass and corn. Alfalfa makes an excellent silage, but its peculiar quality of retaining its green food value, as hay, when properly cured, makes its ensiling much less a necessity. Alfalfa hay taken from the mow in February, green, appetizing and nutritious, falls little, if any, short of serving the purposes of silage.—From Coburn's Book of Alfalfa.

Husum, Washington, reports its Spitzenberg and Newton apples the best ever.

Sanger peach growers are being paid by the cannery $25 to $27.50 per ton.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

TUBERCULIN.

By Mrs. Minna E. Sherman.

THE idea that one can pick out the diseased cows in a herd by the eyes or by physical examination dies hard in the mind. Before a cow reaches so advanced a stage of this disease her skim milk has doubtless infected a number of the calves and her presence has spread the disease among others of the herd. A friend sends me a clipping from The Tribune Farmer of July 7th marked, "What do you think of that?" The following is the vital part of this article and it seems to me to be based on an idea rather than actual facts, as I understand them.

[The writer, in the article which Mrs. Sherman sends goes at some length into the claim that Wisconsin has more tuberculous cattle than any other section and that it has done more tuberculin testing than any other section. There is also a lone resolution passed by the Missouri Veterinary Association in which the same claim is made and, of course, the claim set up that it is because the work was done by inexperienced farmers and not by professional veterinarians. The writer in the Farmer then adds: "When all such talk is analyzed it shows a great desire to hold an option on the use of tuberculin and compel the farmer to employ a certain class of veterinarians to do the work for them at a large fee for doing a very simple thing. I believe that Wisconsin, where tuberculin has been the most used, has more tuberculosis than in an equal area where tuberculin has not been so extensively used. It furnishes ample proof of the contention I have repeatedly made that the general, indiscriminate use of tuberculin has been disastrous to the cattle industry of state and nation where it was put into practice. Use it when and where there is seeming need to use it, and stop there. More and more the truth is coming to the front, and that is that tuberculin is not the harmless culture it has been thought to be. It will cause and has caused inert and harmless bacilli to become active."]

What is Tuberculin?

This seems to be rather a misunderstood substance and a few words about it may not be amiss. Dr. Robert Koch was searching for a cure for tuberculosis and made this serum for treatment. It proved a failure in the human subject, though at first it was heralded as a cure. In the early stages of the disease it seemed to help, but it was discovered that later on it only accelerated the inroads of the disease it was intended to cure. Now at Dorpat, Russia, Prof. Gutman was using tuberculin on patients. He noted a regular rise and duration of temperature and found it could be relied on to take place in every case. He then turned to experimenting on cows and making postmortem examination he demonstrated the truth of his theory of its value in showing the disease. He announced this discovery in 1892 and today it is used in most of the greater dairy countries.

How Made.

It has been known that bacilli are self limiting to a certain extent. They live and secrete by their life activities certain toxins that act in turn as poison and bring to an end their life. Tuberculin is made by taking the active bacilli and placing them in the serum or white colorless portion of the blood or in meat juices, and placing the tubes in an incubator holding it at blood heat for several weeks until the bacilli have filled the mass and the toxins have been fully excreted. Then the tube is placed in a receptacle and the temperature raised to 250 degrees Fahrenheit and held there for forty-eight hours. This kills any remaining bacilli. The mass is then forced by air pressure through a porcelain filter and then again raised to 250 degrees Fahrenheit. The tuberculin is then dissolved in glycerine, with a little carbolic acid added, to a 10 per cent solution when it is ready to be placed in the small bottles and sealed for commercial use.

Tuberculin Testing.

When the dairy was running here on the ranch an opportunity came to buy a nice young herd of Shorthorn cows all dry at the time. Fifty-eight head were selected and placed on a pasture ten miles away. A competent Scotchman and his wife took charge of them. One cow looked thin and died when she calved two weeks after purchasing them. She was buried before we were informed of her death, and then we were told that another cow looked badly and was coughing. We went to see them and I said, "Kill her at once and we will see what is the matter." My father went with me the next morning and examined the butchered cow and said consumption. We buried her and came home feeling pretty blue. Then came one of those coincidences that make one believe in a Heavenly Father. A letter was received from one of the younger men of the family from Paris telling of the wonders that he had just heard in the lecture room, of the discovery that tuberculin would show the disease in cattle. A telegram to Philadelphia brought in line old friends among the medical men and in two or three weeks we were equipped with tuberculin and a knowledge of how to inject it.

Easily handled. *Will last a lifetime. The correct way to irrigate alfalfa.* We make Riveted Water Pipe and Tanks. *Write for illustrated catalogue.*
AMERICAN STEEL PIPE & TANK COMPANY
349 Pacific Electric Building Los Angeles, California

Using.

Then it was thought that it could not be used on a cow until she freshened, so we, my father and I, tested each of the cows among those Shorthorns until thirty-eight were put under the alfalfa blooms—we did not have any daisies or we might have been more poetical. The other twenty did not react then nor at any later testing. The first eight or ten we performed autopsies on, but after that the Scotchman understood it and would save the piece of diseased organ for my father to see. Now excepting the first two these cows were as sleek and fat as any cows. I bought them for thirty-two dollars a head and was offered forty before I had them a week. No one could see they were diseased.—M. E. Sherman.

THE AYRSHIRE COW.

During the past few years, since the Ayrshire Breeders' Association instituted official tests conducted by and under the supervision of the Experiment Stations, the Ayrshire cow has made rapid progress in popularity, as the perfect dairy cow. This official testing has brought to the front a class of dairy Ayrshires, noted for utility, and has more and more influenced the breeders in trying to eliminate any defects she might have, and bring to the front her remarkable qualities as a profitable dairy cow for every day service. One hopeful feature of the breed is that she has built herself up on all lines of dairy utility in dairy conformation and dairy lines of beauty, and the Ayrshire cow stands today unique among the dairy breeds, with no aristocracy of family distinction, but maintains her popularity from her individual and breed qualities.

While there are minor differences in her appearance, under different breeders, and in different countries, the Ayrshire is an Ayrshire wherever found, and shows the same strong breed characteristics, of shapely udder, strong constitution, and vigorous appetite, shows herself to be a great dairy cow under any and all conditions, and carries the type of the breed in her every act.

In Scotland, in Canada and in the States she has been bred not for family booms, or individual phenomenal excellencies, but all along the line she has been pushed as a breed of uniform dairy superiority.

This is I believe greatly to her advantage, and greatly to the advantage of all purchasers of Ayrshire cows, for the uniformity of her dairy excellence makes all buyers pleased with their purchases and maintains the general good name of the Ayrshire cow. In studying the results of the testing for advanced registry the two facts are strongly brought out that there is great uniformity in the breed in production at the pail, and while we cannot boast of any world beater in one or two individual cows, we rejoice in the fact that there are none very poor, the general run being from good fair cows to very superior ones.

The quickest, surest, and most satisfactory way to improve the breed and bring it to the highest perfection is to use only strictly first class bulls, from the best cows to be found, cows with great dairy capacity, shapely udders and long teats, and to this end all breeders of Ayrshires can do great work for the breed by killing all bull calves that are not from grand cows, with shapely udders and long teats. The breeders of Ayrshires are the ones on whom rests the future of the breed.—C. M. Winslow, Brandon, Vt.

In selecting a brood sow it is important that the number of pigs she farrows, the number she raises, and her attitude toward them be determined before purchasing.

Cream Separators, all sizes and prices. O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.

TEACHING THE NOVICE TO MILK.

Answering the question of a freshly installed "farmer" as to how he can learn to milk, the Rural New Yorker says:

If you will buy a gentle easy-milking cow, you will find little difficulty in learning to milk. Some one of experience could choose such a cow for you, and give a practical demonstration of the art. In milking always place the stool on the right hand side of the cow, and near enough to her, so that you can easily reach all parts of the udder. Do not crowd up too close, or a slight sway of her body in your direction might disturb your centre of gravity, causing it to fall outside the base of your stool. The pail is usually held between the knees, or on the "rest" of a stool made for the purpose, but may with safety be placed on the ground or floor, if the cow is quiet and gentle. Many old milkers wet the teat with milk before beginning. This is a useless and dirty habit, and should be avoided. If a cow's teats are hard or chapped, they may be softened with a little vaseline. Most milkers milk the two fore-quarters together and the two hind-quarters together, but this is unessential. When the teats are close together it is often easier to milk "cornerwise," for instance taking the right back teat with the left hand and the left front teat with the right hand. Avoid twitching and pulling the udder—the squeeze is what draws the milk. Squeeze from the udder down. If the whole hand is shut together at once, the milk will be forced back into the udder, instead of into the pail. The idea is with each pressure to shut off the flow above and force the contents of the teat into the pail. If the hand is closed naturally, the little finger being the shortest, will be the last to touch the palm, so the human hand seems to be a natural milking machine. Before leaving the cow, each quarter should be gently squeezed between the hands, reaching well upon the udder and working down toward the teat. This will materially help in getting all of the milk, which, of course, is very necessary. A gentle, easy cow, and a little practice will soon solve your problem.

For the first weeks of a pig's life the mother's milk is its drink as well as food, and therefore in caring for suckling sows it should be the aim to so feed them that milk of only medium richness will be furnished instead of a limited supply of that which is extremely rich, the latter being less healthful and more liable to cause thumps, scours and unsatisfactory growth. It is only a law of nature that pigs should make more economical gains through the milk of the dams than in any other way, and it is also true that the sow will furnish nourishment for her young at less cost for the raw material than any other animal on the farm. A sow's milk is rich in solid matter, which amounts to 17 to 20 per cent. On a comparative basis of 1,000 pounds live weight a cow giving 3 gallons of milk a day will give in the milk 1 pound of fat and .77 pound of protein daily, while a sow's milk will yield 1.26 pounds of fat and 1.1 pounds of protein a day on an average. In composition sow's milk in comparison with cow's milk is very high in total fats as well as solids.—From Coburn's Swine in America.

No Hoof, No Horse

U. S. statistics show that 80 per cent of all horses are lame and that 80 per cent of the lameness is caused by hard and contracted feet. As a hoof softener, toughener, nourisher and grower there is nothing equal to

Eshelman's Wool Fat Hoof Healer

A horse's hoof is from 60 to 70 per cent water. Grease and water will not mix. There is no grease about Wool Fat. It mixes readily with water, is very penetrating, and while a great medicine of itself, it also acts as a vehicle to carry to the afflicted parts the other medicinal properties of the HEALER. It is absorbed into the skin and gives natural stimulation and nourishment to the hoof. There is nothing that can compare with it for this purpose, nor as a remedy for contracted hoofs, split hoofs, quarter cracks, mud fever, corns, grease heels, and for all kinds of sores and cuts anywhere on any stock. If you have tried it, you know that this is true. If you have never tried it, it will surprise you with its power as a healer and restorer. It is not a new remedy, but has been on the market in the East for many years, where it has given the greatest satisfaction.

4 oz. package, 25c; 12 oz., 50c; 32 oz., $1.00; 5 lb. pail, $2.00; 10 lb. pail, $3.50. It is easy of application. Directions with each package.

TRIAL OFFER.

We will send you a 2-lb. can, use it 15 days, and if satisfactory, send us $1.00. If not, write us to that effect, and you need pay nothing. We take all the risk, you just try it. Send for it today.

SAVE YOUR ALFALFA SEED

We continue to warn Farmers that 25 per cent. of their Alfalfa Seed is wasted when the ordinary grain separator is used for threshing.

IT IS VALUABLE

Alfalfa Seed is being imported into this country every year because the Western Farmer does not produce enough seed to supply the demand. With the prevailing high prices of seed you cannot afford to have your seed wasted in threshing. We build the only machine in the world constructed especially for hulling Alfalfa Seed. If your thresherman does not have a "Birdsell" Alfalfa Huller give us his name and address and we will send him our Catalog and you shall have our 1910 and 1911 calendar in colors.

OUR ALFALFA BOOKLET—FREE

This booklet contains 48 pages and was written by an Alfalfa Specialist. If you are not raising Alfalfa send for this book. He tells you how to start a crop, raise and harvest it. Every man should have this booklet. Write today.

The Ornamental Garden

THIS MONTH.

MANY annuals, especially pansies and stocks may be planted during this month. Prepare beds out of doors in well enriched light sandy soil. Cover seed very lightly. A light leaf mold or some form of mulch sprinkled over the top lessens liability of baking. In addition, in warm, dry sections a layer of burlap over the ground, sprinkling to be done on top of burlap, is often found desirable. Of course the burlap must be taken off as soon as the young plants begin to appear.

Verbenas, petunias, Chinese pinks, salvia, carnations, and other seed may be sown in the ground or in flats in greenhouse. If sown in greenhouse, take care that there is no damping-off. In lieu of the greenhouse, success is often obtained by common sash leaned against building. Be careful not to let plants scald or burn.

Divide violets or secure new stock. Mulching will prove profitable. Goldenrod is beginning to bloom and requires plenty of water from now on, as does golden glow. These two plants give glory to the fall months and should have more general culture. Above all bear in mind that the soil is getting dry. Abundance of irrigation is necessary for best results.

A PERFUME GARDEN.

"A very little space will suffice to raise the sweetest of the perfume plants—this term being understood to mean those plants which in their flower, branch or root furnish a permanent fragrance, in a form immediately available for use," says Grace Tabor in Woman's Home Companion.

"Lavender comes at once to every one's mind in this connection, the famed sweet lavender of ancient linen room and press being probably the most widely known of all these plants, familiar even to those who have little idea how it grows.

"The seed is listed, but it is better to buy the plant already started, for seedlings do not run true to variety. The lavendula vera is the true sweet lavender; give it an open, light, rather dry soil and full sunlight and free air.

"It is shrubby and grows from two to three feet high; its blossoms come in July and August, and are exquisitely fragrant. Cut the flower stalks with plenty of the surrounding green —the fragrance is in green corolla and even in leaf and branch—in clear weather, in early flower, and early in the morning before the dew is off the plant, and hang immediately to dry."

REPOTTING PALMS.

Potted palms grow best in very light porous soil. That made with a mixture of one part each rather moist sand, garden soil and fine old manure appears to be best. The pots should be well filled with drainage holes, so the water is never retained but drains away promptly. When growing, the soil should be kept moist at all times, but seldom soaking wet. In repotting palms it is good only to use a single size larger than the pot in which it has been grown. A mistake in overpotting is often made, resulting in a decrease of vitality. Another common mistake is to pot too deeply, making the bases of the stem reach below the soil level. Palms naturally grow far above the soil sending their roots down so that there are air spaces between the roots. If you repot your specimen in a smaller pot, use light soil and keep the base at least two inches above the surface and you will have no further trouble. —Rural New Yorker.

IMPROVING AN OLD LAWN.

To renovate lawns that have become worn out by neglect or other causes, and where it is not convenient or desirable to renew by plowing up, they may be greatly benefited by running a light harrow over, if the surface is large, or by a sharp steel rake for smaller areas. After stirring the surface by such means judiciously, so as not to hurt too severely the roots, lawn grass should be sown over the surface, harrowing or raking in about half the quantity advised for new lawns. After sowing, the surface should be harrowed or raked over, and firmly rolled or beaten down, but if spurious grass or other weeds have possession of the lawn, then this way of renovation would not be satisfactory, and it had better be plowed under and sown afresh, in the manner already given for the formation of the lawn.

SULPHIDE OF POTASSIUM FOR ROSE MILDEW.

Sulphide of potassium solution at the strength of about one ounce sulphide to a gallon of water freshly dissolved in hot water is an excellent remedy for clearing dormant and growing roses of mildew, but it does not long hold the disease in check. The best remedy we have ever found both under glass and outside is flowers of sulphur blown or dusted over the foliage when wet with dew or rain. The sulphur is volatilized by sun heat, giving forth gas that is quite destructive to mildew and not harmful to plants. Sulphide of potassium solution is most useful for spraying dormant roses when they are brought in from the field to be potted or benched in the greenhouse. It kills any spores that may be present and thus prevents the disease from starting.—Rural New Yorker.

Remove the rickety fences; tear down the dilapidated buildings and sheds; send the tin cans, broken boxes, and cinder piles the way of all useless things; clear the yards; in the place of the aforetime rubbish grow things. Have neat lawns, whether the premises be large or small; clean roads; clean streets; clean alleys; the abatement of nuisances; the elevation of farm as well as city life; the cultivation of interest in the moral, intellectual, and physical welfare of the community; and the creation of enthusiasm and love for the beautiful and the good.

Small Fruits and Vegetables

THIS MONTH.

THIS may not be a typical gardening month; at the same time many things now require attention. Vines and refuse of the earlier plantings should be removed and burned, or if composted, distributed in other places than the garden, for the reason that fungous troubles of the earlier crops are sometimes transported by this means.

The regular fall crop of potatoes should be put in at once. This is the stand-by crop of the year and only irrigated sections will grow it. The planting should be preceded by most thorough irrigation, for the hot weather still to come calls for abundance of water deep in the ground. If land is irrigated by the furrow system, a long run should be secured. If it is checked, be sure that the dams do not break and that sufficient water is held in the check to soak very deep. As soon as the ground is in condition to work, deep plowing should follow. It may then be harrowed down and marked off for the dropping of seed. Some gardeners precede the planting by a second irrigation, but if the first is thorough enough and the subsequent preparation of the soil has been carefully done, the second irrigation should not be necessary. Be sure that the seed is ripe, as unripeness of seed is a frequent factor in failure of the fall crop. It is wise to soak the seed for an hour and a half in solution of bichloride of mercury 2 ounces to 15 gallons of water, or in solution of formalin 1 ounce to 2 gallons of water.

Now is the time to prepare seedbed for winter crop of tomatoes. Fall and winter peas may now be planted. Yorkshire Hero is probably as good a variety to plant as any for this season. Market gardeners are now planting this variety heavily. Cabbage, cauliflower, celery, and onions may also be sown for the main crop of the year. Of course radishes and lettuce are always in order, but care must be exercised in planting and irrigating them.

WHERE POPCORN IS A MAIN CROP.

"The popcorn center of the world" is the title claimed by the little town of Odebolt, Iowa. There are 1,600 Odeboltians and every one of them is convinced of the wisdom of keeping track of the world's popcorn appetite.

That 15,000,000 pounds of popcorn is raised within fifteen miles of the town is the result of a small beginning made years ago by A. H. W. Reuber, when he rented twenty-five acres of land and set it out in popcorn. He repeated this two or three times before he was convinced of the possibilities before him.

Then he got more land, and still more; and all of it he put into popcorn. His neighbors followed suit and when that happened he bought their crops until, acording to the Saturday Evening Post, he became the popcorn king. He raises 120 acres of his pet product and buys most of what his neighbors raise.

In Odebolt there are enough popcorn cribs to take care of 7,000,000 pounds of the grain. One of these cribs alone holds about 1,000,000 pounds. In 1909 there were more than 150 carloads of popcorn shipped from the town—Coleman's Rural.

VIABLE SEEDS.

A viable seed is one having life enough to germinate. Seeds that are to be planted for the production of some valuable crop must not only barely germinate, but they must germinate strongly and vigorously. The sprout from a weak seed may be easily killed by any unfavorable condition such as cold, excess of moisture, drouth, insects or poorly prepared seed bed. A strong and vigorous seed on the other hand may possess such strong vitality that none of these harmful conditions will destroy it. The farmer cannot afford to plant seeds of weak vitality. The vitality of seeds is determined by testing either in the soil, or when that is not possible, in a germinating apparatus. Any kind of apparatus which will make it possible to keep the seeds moist (not soaking wet) and warm, will be suitable for testing seeds.

For determining vitality, one hundred seeds are placed in the apparatus and allowed to sprout. The number germinating will represent the per cent of germination. The following table is adapted from the Year Book of Agriculture for 1895. This table gives the number of seeds in a hundred of the various farm crops that should germinte.

Crop.	Percentage.
Beans	95
Buckwheat	92
Carrot	85
Corn	93
Clover, red	90
Clover, white	85
Clover, Alsike	85
Kentucky bluegrass	50
Millet	85
Orchard grass	80
Peas	98
Pumpkin	92
Squash	92
Sunflower	90
Sorghum	90
Timothy	90
Tobacco	88
Turnip	95
Wheat	95

It must always be remembered that under ordinary farm practice, where the seeds are planted in the soil, a much smaller per cent will germinate than in the germinator.

HOW TO GROW WATER-CRESS.

Those fond of water-cress may have a summer's supply by sinking an old tub or bottom of a hogshead to a depth of ten inches near a pump or well or where the water can be frequently renewed from hose. Half fill receptacle with good soil, plant rooted water-cress and fill with water. A border of umbrella plants or other aquatic plants will make it a thing of beauty as well as of utility. A further improvement may be made by planting iris around outside of the tub, the overflow of water giving the necessary moisture to the flowers.—Woman's Home Companion.

Sweet corn is sensitive to climatic changes. The principle of acclimatizing field-corn has become very well known, and in general the same applies to sweet corn. It requires some years of successive crops for a given variety to become well adapted to a particular locality; so it is not best to send too far away for seed. Follow the same general method you apply in the selection of your field-corn or buy from a grower in your own state.

For Work or Play

The backbone of our business is the manufacturing of Tents, Awnings, Irrigation Hose, and of heavy canvas construction in general. However, we serve the public in many ways: We supply you with hunting, fishing and camping goods, with outing apparel, storm clothing, sweaters, bathing suits, with flags, bicycles and kodaks.

GENERAL AGRICULTURE.—New Hope for the Man with the Plow; Bleached Flour Case; Rhodes Grass: 113.
QUERIES AND REPLIES.—Dodder; Milk Closer; Best Dairy Breed; Cascara Sagrada; Date Palm; Squash Bugs; Pruning Apricots; Seed Bed Stock; June Beetles; Squirrel Poison in Oranges; Chlorosis; Swelled Head; Profit from 2000 Chickens; Bleaching Raisins: 114, 119.
HOUSEHOLD.—Unafraid; Helped to Finance the Revolution; Food; Pounded Meat; Post Cards: 116, 117.
PRODUCE MARKETS.—Los Angeles Market, San Francisco Market, Deciduous Market; Citrus Market: 118, 119.

Control of the Colorado.

The interview of Col. Holabird and Allan Kelly with President Taft at Beverly on the question of the control of the Colorado, develops one feature in its handling stunning to the property owners of the Imperial Valley and to a certain extent to the whole West. President Taft entered into the study of maps and notes with desire to get a perfect understanding of the situation, and he secured a great fund of information as to the possibilities of the rich valley and methods of control of the river, but on the question of bearing the expense of this control, the President suggested that the government be reimbursed in part for "its expenditure on the Colorado by the various interests to be protected or benefited, and that a board of arbitrators should be created to determine the proportion of cost to be assessed against the government, the settlers of Imperial Valley, the Mexican government, the C. D. Co., the Reclamation Service project, the corporations doing business in the valley, the railroad and others."

This was a new view of the case, and as Mr. Kelly writes, "took us by surprise." The people had believed that when Congress appropriated the money for protective work, the government assumed responsibility for control of the river as a public duty. No part of the cost of control of the Mississippi and of making it navigable is assessed upon the direct beneficiaries. The same is true of a thousand and one other sections all over the country. Why the government should be reimbursed for the control of the Colorado is unexplainable excepting from the standpoint which President Taft advanced that this expenditure must be made in foreign territory, that is, the work of control must be done in Mexico, and there is no precedent for such expenditure of government funds.

Of course it goes without saying that there should be arbitration between this country and Mexico, and Mexico should unite with us in protecting its own property, but for the government to levy part of this expense on the people of the Colorado Desert in face of all the hardships they have taken upon themselves is, we feel, adding further to those hardships. However, Mr. Kelly closes his account with:

"The President received us cordially and simply, and plunged into business directly. He is a robust, forceful man, tanned to a healthy brown by exposure to the sun on the golf links, and he seems quite able to bear without fretting the burdens of his office. The smile was there and sometimes it was a hearty laugh, but the lips could set in grim lines and the twinkling eyes were not always smiling. It will not be easy to move him from any position he has taken, but he has the judicial habit and he will listen to and weigh arguments."

* * * *

Touching upon the suggestion by President Taft that the cost of controlling the Colorado be assessed to irrigators and others who use its waters, an article in the World's Work for August on "The Crime of the Pork Barrel" gives figures showing that the attitude of Congress is in striking contrast to that of the President. This article touches upon the system by which the taxes paid by the people are used to aid congressmen in securing the good will of their constituents by "improvements" of rivers. One instance is given in which the cost to the government of "improving" a river was $183 for every ton of freight transported over the "improved" river." Yet a little improvement in the Colorado river which would save millions and enrich both state and nation must be assessed against the people directly benefited.

Citrus Growers Convention.

The Cultivator has information from State Commissioner Jeffrey that arrangements will be made as rapidly as possible for a state convention of citrus fruit growers to be held under the auspices of the commission at Pomona, September 13 and 14. This meeting is called at this time and in this central citrus growing section for the purpose of discussing physical condition of citrus groves and prolonging of their life. In fact, from the circular we take it it is very much the same question as was discussed in a former Cultivator as to how to prolong the profitable bearing period of citrus trees. Mr. Jeffrey writes:

"In many of our citrus groves deterioration has been expressing itself in barrenness, in lack of health and vigor and in poor quality of fruit. The problems involved in these effects are of great obscurity; they are found in every locality in the state; if they are not met with wisdom and understanding the citrus fruit business cannot remain prosperous or our land values be maintained. It will be the business of the coming conference to get together the sum of the views and experiences of trained observers, scientific investigators and practical growers, and to unite in business-like council the factors able to solve these obscure problems or at least able to provide some plan for their solution. To do this the order of business and the discussion will be directed toward results, and the elimination attempted of all matters that may be narrow or valueless in their application or whose consideration would lead to no definite results."

As soon as the program and other arrangements are made, more definite announcement will be given in the Cultivator, but sure it is helpful papers will be offered at the convention by men of science and men of practice, and the people of Pomona will extend a cordial welcome to all attending.

An Apple Show.

The apple growers of the Pajaro Valley are already active in preparation for the "Apple Show where apples grow" which is to be held in Watsonville early in October. In a recent circular from the advertising department of this exposition the claim is made that apples and berries are not the only productions of the rich Pajaro Valley. Amongst other statements we note:

"Watsonville and the valley are the greatest places for babies, especially twins, in California. There are twelve pairs attending the local High School, and nine pairs attending the grammar and primary grades, while 42 other pairs are growing up. Besides there are "singles" galore. It is planned to have a "baby carriage" division in the big parade, in which 400 mothers and their pink and plump darlings will appear.

"Freight rates on all exhibits will be the same as to the State Fair at Sacramento, free if returned to original point."

The paragraph on freight rates is reassuring and parents wishing to take their twins and others for competition in the big parade should apply early for transportation, and, no doubt, the Southern Pacific will return the youngsters to the "original point."

Farms For Sale.

We have received an attractively printed and illustrated booklet issued by the New York Central Railway, entitled "Farms for Sale or Rent." It is practically an advertisement, though not along real estate dealers' lines. The railroad people claim that their point is to show that the value of these lands is not fully appreciated and that the state is still capable of raising good crops. Some of these lands which have been abandoned may be had at a very low price; oth ers are well stocked and listed higher. There are over 300 farms listed, aggregating 6346 acres, and the average price is less than $20 per acre. The booklet admits that many of the farms show discouraging conditions, but the railway people hope to make such a showing that in a few years the situation will be greatly improved. They claim that these lands near the great markets of the country should be built up so as to be as profitable as are the western farm lands.

Along the same line is another booklet describing farm lands in Maine, making an especial point of the advantages of fruit growing there.

Western farms will need improved methods to keep in line with these efforts along the Atlantic.

Misbranding Foods.

The Department of Agriculture is sending out a vast number of circulars touching upon the misbranding and adulterating of foods. These cover all kinds of food consumed by humans, and occasionally stock foods as well. In one of these circulars is a rebuke for raisin packers, and incidentally for all who put up food for human consumption. It is headed "Misbranding of Raisins," gives the name of the company putting them up, and refers to the statement on the packserts that the label on these packages, "Choice age as "false, misleading and deceptive." It as-California Raisins" is "false, misleading and deceptive, inasmuch as the said raisins were not choice California raisins, but the same were in fact composed in part of a filthy and decomposed vegetable substance."

It is unfortunate that such goods are ever sent out from the vineyards of California, and we are glad the department is confiscating and destroying such stuff.

Agricultural News Notes of the Pacific Coast

Northern California

Petaluma Incubator Company reports a single order for 2,000 incubators.

An effort is being made to organize the fruit growers of Gridley, Butte county.

Apiarists of Eldorado county report almost a total failure of the honey crop this year.

Eight full trains of fruits have been handled over the Western Pacific to Eastern points.

Sebastopol, Sonoma county, has shipped its twentieth carload of berries for the season.

Orland, Glenn county, reports the biggest promise for output of almonds in many years.

A special fruit train has been put on by the Southern Pacific between Roseville and Marysville.

Boys at Chico are reducing the grasshopper supply by using them for bait on their fishing trips.

The Hayward Review reports that tons of apricots rotted in that section because of lack of helpers.

It is being urged that Sacramento and Yolo counties unite in a persistent fight against pear blight.

Most apricot growers of Yolo county have disposed of their output and are now working on peaches.

Fifty thousand dollars worth of grain went up in smoke in Colusa county as result of a field fire.

"Standardized" fruit is being forwarded every day from various shipping points in Eldorado county.

One company at Wheatland, Yuba county, has 500 acres of hops. The crop will not be heavy this year.

Owing to lack of moisture in almond orchards of Yolo county, it is feared many "stick-tights" will result.

Healdsburg, Sonoma county, is shipping extensively of fresh fruits, four cars of apples being one day's record.

Solano-Yolo Land and Water Company will extend irrigation ditches so as to place extensive tracts under the system.

Directors of the levee district at Nicolaus, Sutter county, propose to raise the levee five feet for a distance of five miles.

Sonoma county Gravensteins are now selling at $55 per ton. It is estimated that the yield of the season will be about 125,000 boxes.

There is rejoicing at Weaverville, Trinity county, because of the forest service authorizing the sale of a billion feet of timber from the national forest.

One company at Wheatland, Yuba county, will use four hop picking machines this fall. The picking will begin on August 5th and over 1000 people will be employed.

The Lassen County District Fair will not be held this year. The reason is given that saloon men would not make their usual contribution because the town trustees refused to grant permit for customary games during fair week.

Central California

Delano, Kern county, reports wheat crop practically all in.

The Hanford Creamery complains because of smallness of peaches.

Melon shipments from Turlock, Stanislaus county, were 108 cars up to July 19th.

A warehouse containing 200 tons of straw was recently destroyed at Monterey by fire.

The plans for the apple annual at Watsonville indicate that a great exposition will be held.

Monterey apricot growers are holding out for better prices than have yet been offered this season.

A large buyer of raisins in Fresno county has predicted that prices will range between three and four cents.

A joint meeting of the Farmers Unions of Easton and Oleander, Fresno county, will be held on August 12th.

An effort is being made to have established a special milk and cream train from the Valley to San Francisco.

Gilroy, Santa Clara county, shipped during the last year more than 1100 full carloads of hay and other home products.

Porterville, Tulare county, is not exclusively a citrus town as is shown by the shipment on one day of six cars of green peaches.

Many trees, especially shade trees, at Hanford, Kings county, are losing their leaves because of the work of pest known as lace bug.

The sewer farm of Visalia, Tulare county, reports products of the farm during the last year: hay valued at $850, corn $800, hogs $1062.

An irrigation expert from the Island of Java on a tour around the world investigating irrigation systems, was in Fresno recently.

Wine manufacturers of the Valley generally unite in the claim that wine grapes will range very low this year, probably between $5.00 and $7.50.

Fruit canners report trouble with the French authorities over the claim that boracic acid is used as a preservative. The canners assert that it is not.

The supervisors of Santa Clara county have granted an appropriation to improve and increase the display of Santa Clara fruits in the Ferry Building.

The amount of citrus seed-bed stock for nursery purposes in Tulare county, as reported by Commissioner Schulz, aggregated practically a million trees.

Raisin men are still looking for a Moses to lead them from the present wilderness, and predict that unless conditions are changed another disastrous year will face the industry.

One raisin packer has estimated that if the crop does not exceed 45,000 tons, the growers will realize in the neighborhood of $4,500,000, but if the crop reaches 60,000 to 70,000 tons, the returns to the grower may not exceed $2,800,000.

Southern California

Orange county apricot growers are selling pits at $22 per ton.

There are approximately 1500 cars of Valencias as yet to go forward.

Three fully equipped creameries are operating in El Centro, Imperial county.

One hay baler at Escondido made three moves during the day and baled 69½ tons.

Banning, San Bernardino county, had light showers on several days last week.

One cattle ranch in Antelope Valley has sold this year something over 700 steers.

The estimate of Southern California for the coming walnut output is about 6,000 tons.

The Oxnard sugar factory started work on July 17th, and has promise of a long campaign.

The Yucaipa Water Company No. 1 has filed articles of incorporation in San Bernardino county.

There are about 1300 acres of potatoes on new land in the big Baldwin Ranch west of Covina.

Orange county dried apricot holders have closed a deal for two cars of apricots at ten cents a pound.

Articles of incorporation have been filed in San Bernardino county for a Products Company which is to produce oils from fruits.

Apricot growers at Moorpark and Fairview, Ventura county, have ageed to hold fruit until at least ten cents per pound is secured.

The report of one co-operative orange growers association at Riverside shows $2.30 per hundred for all navels delivered during May.

There are 17,000 acres of beans on the big San Joaquin Ranch in Orange county, which at this time promise an exceptionally fine crop.

Elsinore, Riverside county, will produce less than one-third of a normal honey crop. Buyers are in the field offering six cents for extracted.

Escondido, San Diego county, was visited by a genuine "back East" thunder shower, one freak of which was the killing of two valuable cows.

The Mill Creek Pipe Line and Reservoir Company is a new corporation formed to take over the rights of the Mission District, San Bernardino county.

Reports from Detroit give great credit to the exhibit of the Orange Belt show made by the Elks from oranges and other fruits picked in Southern California.

Residents of the Palo Verde Valley in southeastern Riverside and northeastern Imperial counties, are concerned over what is charged to be a land grabbing scheme in a swamp land project.

The Escondido Citrus Union has been organized and will build a packing house at once. There are 150 acres of citrus fruits represented by the membership. The board of directors for the first year is made up of J. A. Whetstone; W. W. Johnson; R. C. Sandel; M. G. Culp; and Arthur Jones.

The Coast

Granger, Washington, is asking for a cannery.

Many cattle died as result of brush fires near Colville, Washington.

Seattle, Washington, reports more export flour business than for three years.

Heavy winds have caused the lodging of much grain near Pullman, Washington.

Wool sales in the Inland Empire of eastern Washington, ranged near the twenty-cent mark.

A Walla Walla farmer has several acres of wheat which is running 68 pounds to the bushel.

Portland Live Stock Association offers one $10,000 purse in its trotting class for the fall agricultural fair.

An institute under the direction of the Agricultural College of Oregon was held last Saturday at Gardiner.

The apple growing sections of Oregon report this year's crop to be fifty per cent higher than any preceding.

Special fruit trains under five-day schedule have been granted to fruit shippers at North Yakima, Washington.

Peaches at Milton, Oregon, have been packing exceptionally fine quality, running as high as 50 to the box.

Pacific Coast Nurserymen's Association held its eighth annual meeting at Walla Walla, Washington, last week.

Americans who emigrated to Canada are now returning in large numbers and taking farms in Washington and Oregon.

The farmers unions near Gifford, Idaho, will build warehouses and appoint agents to handle products at coast points.

A passing engine dropped a spark in an eighty-acre wheat field at La Grande, Oregon, and the crop went up in smoke.

The acting governor of the Hawaiian Islands has signed a proclamation creating a forest reserve on the island of Hawaii.

Experiments with codling moth control at Pullman, Washington, have proven the possibility of saving 90 per cent of the entire crop.

In addition to the long continued drouth an electric storm and drying wind have visited the farming sections near Ritzville, Washington.

A wheat grower at Walla Walla, Washington, has produced wheat, the grains of which are a third of an inch long and an eighth of an inch thick.

Twelve surveying parties will be put into the field on government lands in western Montana, and as soon as possible the land will be opened to entry.

The Cudahy Packing Company has purchased 32,000 acres of land in Lower California, just across the line from Imperial Valley, for $1,200,000. It is reported that extensive improvements will be made.

Coulson's

EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying power and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Get it at your dealer's; anyway send for our Catalog which tells about the famous Coulson Products and gives valuable information about Poultry Raising.

Coulson Poultry & Stock Food Co., Petaluma

Germain Seed & Plant Co.,
Distributing Agents for S. California

LEE'S GOODS
Insure Success

Lee's Lice Killer sprayed on the roosts and walls of the house twice a month during warm weather will keep all lice off your hens.

Lee's Egg Maker fed regularly during the moulting season will do more to keep your hens vigorous than anything else you can use. Your hens will lay while moulting, get new feathers rapidly and the fertility of the eggs will allow you to hatch the chicks early in the fall.

Lee's Germozone used twice a week in the drinking water is a very valuable preventative of colds and other chicken troubles.

The Mandy Lee incubators and brooders are built on correct scientific principles, and both the egg and the chick get exactly the right conditions to produce very strong birds. Our machines are easy to handle, the directions for running are very complete, and they are not apt to get out of order. Write for catalog and any other information you want.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

SANTA CLARA COUNTY ALIVE.

SANTA CLARA county through the efforts of the Santa Clara Valley Poultry Association and the San Jose Chamber of Commerce is becoming better known each year as a desirable section for poultry raisers. People are learning that even if they do not desire to engage extensively in the poultry business they can, with comparative ease, raise about one hundred chicks each year giving them spring chickens and fresh eggs at all times.

City folks as well as those living in the rural districts are interesting themselves so much that eastern poultry journals are devoting very much space to stories by professional writers on poultry raising. Many of the reports are misleading in the advice offered. Practical advice is what is needed most and with this in view it is my desire to secure statements from a number of our practical poultry raisers in Santa Clara county.

Among the first to respond to the call for information from practical breeders is the following statement from Mr. H. F. Mann of Moore & Mann which firm has been successful in raising both fancy and utility stock of Barred Plymouth Rocks.

The Santa Clara Valley Poultry Association meets the first Thursday of each month in the Chamber of Commerce rooms and the public is invited to attend and ask questions which will be answered by practical people.—Joseph T. Brooks, San Jose.

Mr. Brooks incloses Mr. Mann's observations which follow.

* * *

Feeding.

For a feeding mash we use a dry mash—everything dry. We use no wet mash whatever. For the dry mash we use 10 pounds of bran, 10 pounds alfalfa, 5 pounds corn meal, 5 pounds ground barley, 5 pounds gluten meal, 5 pounds ground or finely cracked wheat, 5 pounds bone meal and 7 pounds meat scraps. Sometimes instead of corn meal we use Egyptian corn. In addition to this we find it well to feed whole grain once a day, at night. Whole wheat, Egyptian corn or Indian corn alternating, never feed whole grains mixed for the reason that the chicks pick up what they like best and leave the rest. "If you give a child sweet cake, he doesn't want meat and potatoes." Always keep plenty of grit, oyster shells and clean water and in the summer plenty of shade.

In feeding Leghorns there is practically no danger in feeding whole grain twice a day. Our experience has been that there is no danger of getting a Leghorn too fat to lay. A thin hen never lays eggs.

In this climate we can hatch twelve months in the year.

In feeding the larger hens be careful not to feed too much starchy foods. We find that with Plymouth Rocks after they are one and a half years old that there is danger in feeding too starchy foods for they become broody in the summer. It is often the extremely fat hens that set.

The Day Old Chick.

On being taken from an incubator or from the hen our experience has been that the chick should not be fed anything at all for the first 48 hours of his life at least, and for three days is better, for the reason that it has been demonstrated to the satisfaction of poultry men that nature has provided all feed necessary for the first three days, even without water or grit. When three days old, we begin feeding them with a mixture of finely cracked wheat, finely cracked corn and a little finely cracked Egyptian corn, also meat scraps, in the ratio of 1 to 10. It is best to sift the meat scraps so that the little chicks get only the finer particles. Small seeds are not as good for the little chick as the cracked grains. In addition to this we sprinkle rolled oats on the sand for the first feed as it seems to us that the oats put more vitality in the chicks than anything else we can get. Also always keep plenty of grit and clean water for them, with a temperature of from 95 to 100 degrees. For the first few days we find a temperature of 100 degrees very good as in that temperature there is no disposition to huddle. When the temperature is lower, they are inclined to huddle together and the pressing of their bodies together and breathing each others breath is injurious to them.

When the chick is four or five days old we give some kind of green feed. Young tender barley or oats, finely chopped, alfalfa, Swiss chard, and lettuce especially, are very good. Burr clover and white lawn clover finely cut up, are particularly fine. Then when four or five days old we begin feeding cows' milk. We use the common drinking fountain, which must be cleansed thoroughly every morning. About this time we let them out into the exercising room during the middle of the day. On warm days if it is convenient it is well to let them out on to the ground, being careful, however, not to let them out until late in the morning and take them in early in the afternoon and never let them stay out in the wind as a sudden chill will produce diarrhoea.

We use coffee hulls in the brooder as bedding for the first few days although I would recommend fine sand, as there is a tendency to pick at their bedding before you begin feeding them. The rolled oats sprinkled on the floor are very good.

Causes of Diarrhoea.

First of all in removing chicks from the incubator to the brooder great care must be taken in avoiding chills. A sudden chill will produce diarrhoea in almost every case and extreme heat will produce the same result. The writer had such an experience with a brood of chicks hatched and carred for by a hen. A photographer came out to the place and was very anxious to get a picture of the hen and chickens. It was a cool windy day but the sun was shining so we anticipated no trouble. It took some time to get the hen and chicks posed

on the box covered with straw and when we put the hen back she seemed restless. Those chicks never amounted to anything. They got diarrhoea and didn't grow. At first we could not imagine why, but other experiences have led us to believe that it was this sudden chill from remaining out too long which caused the diarrhoea and virtually killed the chicks, for a slow growing chick is poor property for anybody. Hence the necessity of covering the chicks up well in carrying them from the incubator. The temperature should be kept at about 100 degrees but never allowed to go above that, as a higher temperature is just as likely to produce diarrhoea as a low temperature. Keep the temperature at 100 degrees for the first three days. At four or five days old, lower the temperature to 95 degrees, and at two weeks old 90 degrees and so on, gradually decreasing the temperature as the chicks grow older.

Our experience has been that it is well to feed a wet mash. We feed everything dry. If you feed a wet mash from day to day there is always something left and this begins to ferment and is not good for the chick. Hard boiled eggs, finely chopped mixed with crackers or bread is good, also I have had good success with feeding milk curd mixed with bread or crackers. I do not approve of feeding meat alone as the chick is liable to get more than he needs but prefer to mix it with cracked grains. —H. F. Mann, San Jose.

POULTRY QUERIES.

Pullets.

When should Barred Rocks hatched the middle of March begin to lay? What should I feed them? Should the pullets be in a separate pen from the cockerels, and would you advise stuffing the pullets in order to have larger hens?—Miss R. M. A., Pomona.

The pullets will lay earlier if not separated from the cockerels, but it is a question whether these very premature eggs pay or not. If forced too soon the pullets may undergo a fall moult which will put them out of commission as layers during the winter months, so it seems to me a better policy to separate the sexes and confine the cockerels, giving the pullets as much range as the premises permit. Keep before them at all times a hopper of dry mash composed of alfalfa meal, two parts, wheat bran two parts, shorts one part, yellow corn meal one part, with shell, charcoal and beef scraps or granulated milk in separate hoppers always where they can help themselves. Green food they must have in plenty at least once a day, and a good full handful of wheat for each crop every night, and a mixed grain ration in six inches of straw each morning. Said mixture may be one part yellow corn, two parts wheat one part broken rice and one part oats. Two parts oats would be better, but oats are, unfortunately, very high in price, although one of the best grains for growing stock of all kinds that can be obtained.

I don't advise actually stuffing pullets, lest the liver give out and loss result rather than the hoped for gain, but they must be kept growing constantly and nothing helps more than a free range with plenty of shady places to scratch and lounge around it. Do not forget fresh, pure water every few hours during these trying days. When one is thirsty one's self, it is a good plan to see about a fresh drink for the chickens, and some have a faucet so arranged that it drips continually, thus giving the birds fresh water at all hours. Where one cannot spare time to look after them several times a day, this method of watering is to be commended. Too early laying drains the vitality and the bird will seldom grow to full size if she lays before attaining it. Buckeye Belle was the mother of ten chicks when six months and a few days old, was exhibited at the Ohio State Fair with her family, but Buckeye Belle was never the large hen she would have been had she curbed her impatience for fame and left the job of raising families to her staid old mother a few months longer, and every chick died young. So what's the use?—Mrs. Frank Metcalf.

Limberneck.

What is the trouble with chickens which have lost power to raise their necks and heads? Necks appear to be limber and useless. Is there any remedy?—F. S., Pomona.

This trouble is limberneck. Our subscriber is referred to an article on its treatment in Cultivator of July 29, 1909.

IMPROVING FLAVOR OF EGGS.

The New York Experiment Station studied the effect of different rations upon the flavor of eggs. Those laid by hens fed with a highly nitrogenous ration were inferior to those from hens fed with a carbonaceous ration. They had a disagreeable flavor and odor. The eggs and yolk were smaller and the keeping qualities inferior. In the test at the Massachusetts (Hatch) Experiment Station to compare cabbage and rowen as the green portion of a ration for laying hens it was found that the eggs produced on the former ration, although heavier and possessing a higher percentage of dry matter, protein and fat, were inferior in flavor and cooking qualities to eggs produced on the ration containing clover.

A small quantity of chopped wild onion tops and bulbs was added to the feed of a number of hens. After about two weeks the onion flavor was noticed in the eggs laid. When the amount of onion feed was increased the flavor was so pronounced that the eggs could not be used. A week after the feeding of onions was discontinued the flavor could no longer be noticed. —Coleman's Rural.

No success can be obtained with poultry unless the fowls are kept comfortable. A fowl drenched with rain is not comfortable. A man caught in a rain storm can change his clothing and thus save catching a cold, but a fowl must allow her clothing to dry on her. No fowl can stand a constant exposure to inclement weather, and the more we protect them the better will be the results.

How Much Is Water Worth?

Water is very expensive if you are buying a disinfectant that is half water.

Coulson's
CRESOLENE

is a powerful disinfectant and germicide made from coal tar. You add the water yourself to make the disinfectant desired strength. COULSON'S CRESOLENE must be diluted from 20 to 100 times its own bulk. It is not poisonous—more powerful than copperas, chloride of lime and other well-known disinfectants. It forms a milky emulsion that only costs 1 1-4 cents a gallon. It is the cheapest disinfectant on the market and at the same time the best. Use it on stock—poultry—dogs or as a general disinfectant and insecticide.

If your dealer does not keep it, order direct from us. Quart cans—50c. Gallon cans—$1.25. Freight free on gallon orders.

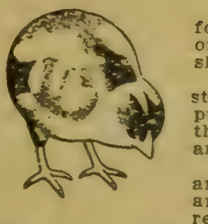
2000 WHITE LEGHORN HENS, $10 PER DOZEN
RIGHT NOW



We have 2000 White Leghorn hens and pullets contracted for. Most of them are 10 months old; as long as they last we offer them at $10 per dozen in dozen lots and we pack and ship them anywhere. Cocks are $2 each.

These hens and pullets are all young and are standard stock, all are pure white and healthy. If you need hens or pullets of the White Leghorn, right now is the time to get them. By September they will be selling at $1 each or more and will be practically impossible to obtain.

We are selling three-months-old Buff Orpington pullets and Rhode Island Red pullets at $9 per dozen. Write us for any kind of grown poultry. FREE 32-page book mailed on request. We are still selling 10,000 chicks per week.

Bees and Their Care

BLACK BROOD IN THE SAN JOAQUIN VALLEY.

By J. G. Gilstrap, Inspector of Apiaries, Stanislaus County.

STANISLAUS county has thus far entirely escaped any appearance of the Black or European Foul Brood, but realizing the need of a knowledge of this most destructive disease of the apiaries, I recently made a trip to Tulare county and gave a few days to study in the apiaries infested. I wish to emphasize this, that the disease is varied in its progress and its working is not fully understood.

First Stage.

Usually the first symptoms are maifested by a yellowish spot on the larva when it is one-half to two-thirds grown and before the brood is sealed. It is, however, sometimes found when the larva is only two or three days old. Again, I have opened suspicious looking cells and found brood affected in the same way. At times it is not even visible until on removal from the cell the yellowish spot is uncovered. But almost universally there is a rather dry, waxy appearance to the unsealed brood and a lack of the moist and slightly corrugated appearance noticeable in healthy brood. As soon as diseased the brood is deserted by the bees who refuse to care for it.

Second Stage.

Within 48 hours after the first attack the brood will usually stretch out straight in the cell, though some still lies curled up. At this stage the change is very marked to a yellowish tinge. Decay is very rapid and the larva flattens out and takes on a darker hue. It soon takes on the appearance of the American Foul Brood, but is not so stringy or ropy.

Third and Last Stage.

The third or last stage shows drying up from the outer end which rapidly turns darker. As it dries it peels loose from the botom of cell. The variation in appearance which is so noticeable is accompanied by variation in odor. The odor is very disagreeable and sickening and does not have the customary "glue pot odor" of American Foul Brood.

Re-queening Helpful.

The most mysterious feature of it all is the one of contagion. It is even claimed that brood combs from a badly infested hive may be placed in the super over the queen excluder in a strong, healthy colony and the diseased combs will all be cleaned out by the bees and the healthy brood in the lower part of the hive will not be affected. This disease not infrequently disappears in a colony or even in many colonies of an apiary, only to reappear in a few weeks or months and generally in a worse form. Many apiarists assure me that requeening with bees of pure blood and high vitality, preferably of the Golden Italian, Carniolan or Cyprian strains, is the best safeguard and the nearest to a cure for this dread disease.

Every inspector of apiaries in the state should study this disease, as should every bee-man. In addition, every board of supervisors should pass quarantine laws against it. Stanislaus county has done this, and I will be glad to mail copy of its bee law to any who will send stamp. This law provides for destruction by fire of any and all bees shipped into the country from any point within 25 miles of an infested apiary, and shipper is guilty of a misdemeanor.

At the trial by which orange growers near Colton are endeavoring to secure an injunction against operation of cement plant, the cement dust gathered from leaves of orange trees was used to construct a block of cement in proof of its injurious nature.

GROSS AND NET WEIGHT OF HONEY PACKAGES.

The question is often asked as to whether we should weigh in the package, and count it as so much honey, or should the package contain a certain amount of honey, net weight? The first year that we produced extracted honey in large quantities, we weighed in the 60-pound tin cans, putting in about 58 pounds of honey. We supposed that was the usual practice; but we received so many complaints, that the time spent in correspondence in trying to straighten out matters was worth about as much as had been gained. Since then, we have put in 60 pounds of honey. I was talking on this point last fall with an extensive producer of extracted honey, and he defended the practice of weighing in the can. He said the producer had to buy this package, and, unless he weighed it in, he received no pay for it. It was worth something to the purchaser, and he ought to pay for it. He cited lard and other goods put up in packages, as being gross weight.

I think it really makes little difference which practice is followed. In any event the producer must get his pay for the package. If he weighs it in he gets his pay for it. If he puts in a certain number of pounds, net weight, then he must charge more per pound for the contents. Which practice shall prevail depends somewhat upon circumstances. I doubt if any product is sold in large quantities, at wholesale, and the package weighed in. No dealer in honey would buy a barrel of honey, and weigh in and pay for 50 pounds of barrel. The same way with a barrel of sugar, lard, etc. But when it comes to putting up these commodities for the retail trade, I think the usual practice is to weigh in the package. Take the breakfast foods, for instance, I believe that the packages are weighed in. The packages must be paid for, and it is likely that this practice secures the object with the least friction. It is not a question of honesty or dishonesty, unless there is an attempt to lead the purchaser to believe that he is getting net weight, when it is gross. It is largely a matter of what is the usual practice; but it ought to be made as uniform as possible. If it is understood that honey by wholesale is to be net weight, and retail packages are to be weighed in, it might simplify matters somewhat.—Beekeepers' Review.

BEE QUARANTINE.

Bee Inspector A. F. Wagner of Imperial County informs us that strict enforcement of the county ordinance against the shipping in of diseased bees is prevailing at the receiving point, Imperial Junction. Every hive of bees shipped into the Valley must be stopped at the Junction and inspected. The Imperial Valley is developing into a great honey producing section, and those who are interested in the industry are demanding that their county be kept free from foul brood and other destructive pests. Therefore anyone contemplating shipping bees to Imperial county should write to Mr. Wagner at El Centro and learn as to requirements of the county ordinance.

Many homesteaders are now moving into Palo Verde Valley in Riverside county.

General Agriculture

NEW HOPE FOR THE MAN WITH THE PLOW.

THERE is good reason to hope that the gasoline engine has greater triumphs within its easy and early reach even than the automobile and the flying machine. Mechanical help is needed by the plowman more than it is needed by any other man on this planet. The muscle of man and of beast yet turns most of the furrows whence our food and clothing come. True, the grain crops are planted and worked and gathered to a very considerable extent by machinery on large farms and in the most advanced regions of our agricultural life. But cotton is yet picked by hand.

But soon the small farmer will have his gas engine that will propel his plow as well as saw his wood and pump his water and thresh his grain and cut his fodder; and the long, tedious and costly experiments to build a successful cotton-picking machine seem practically certain of a successful result. It will be worked by the same kind of power that has made the automobile and the aeroplane possible. And there is no reason why the same power should not be detached from one machine and applied to others that will plow, plant, and cultivate the cotton fields as well as gather the crops.

If you are given to using so big a word as "revolution," you may find an interesting justification of such a dangerous habit in the study of the application of the gasoline engine to the tilling of the soil. It may free more men from the plow and the hoe than have yet been freed from muscular drudgery by steam and electricity.—World's Work.

THE BLEACHED FLOUR CASE.

About a year and a half ago the Secretary of Agriculture decided that the Alsop process of bleaching flour by peroxide of nitrogen was in violation of the pure food law, the allegation being that the process produced nitrites in the bread, which are unhealthy and actually poisonous. The case came into the federal courts and was decided last week in favor of the government, the government showing that the bleaching process not only adulterated the flour, but poisoned it, and made it possible for millers to misbrand their product and sell new flour for old. There were thus two issues in the case, that of adulteration and misbranding, in both of which the jury decided in favor of the government.

The history of this case is rather interesting. The Department of Agriculture introduced what is known as durum wheat, a special boon to farmers in the semiarid section, as it can be grown with less moisture than any of the ordinary wheats. It is very strong in gluten, being as the name implies, the hardest of the hard wheats; but the gluten has a yellow tint. The millers were able to buy this wheat at about ten cents a bushel less than the ordinary hard wheats of the North. In order to pass it off as ordinary hard wheat they resorted to bleaching it with nitrogen peroxide thus taking out the objectionable color.—Agricultural Review.

RHODES GRASS.

We have the following from Mr. B. Harrison of Burringbar, N. S. W., Australia, touching upon a new grass being tried out in that country. It is Chloris virgata. Like the Johnson grass it may have other qualities than Mr. Harrison mentions and its planting till tested should be with caution:

As it may prove of great benefit to stock owners kindly permit me to give a description of the above. This grass is rapidly coming into great favor throughout Australia and the favorable reports of its great merits from many places point to its extensive cultivation. It has proved a really wonderful grass for resisting drought, and will grow and remain green when many of the other species are burnt up. The famous paspalum grass has long held a leading place, but to be a success is requires fairly rich soil, and a warm, moist climate or artificial irrigation. With Rhodes grass it is entirely different, as not only will it thrive well where the rainfall is light, and the soil inferior, but will also survive long periods of drought, and yield well where the paspalum might prove a complete failure, or only exist. In the central dairying districts of Queensland, and the western portion of New South Wales where the climate is dry, Rhodes grass is proving equally as great a boon to the settlers as paspalum has to those in our moist coastal country, and without doubt it will in the course of a very short time, when its great merits become more widely known, prove one of the most beneficial and popular grasses yet introduced into Australia, as it can so easily be cultivated over such an immense area of land. Probably no other grass will give such good and satisfactory results under adverse or trying conditions of soil and climate, as has already been well demonstrated in many localities. The seed is very light and fine, and germinates readily with a small amount of moisture, and from 7 to 8 pounds of seed should be sfficient to sow one acre of land. After germination, the plant throws out strong, vigorous runners, which root at each joint, after which the shoots grow erect to the height of three or four feet. It spreads rapidly, and presents a splendid waving mass of verdure that would delight the eye of the pastoralist. It yields, according to soil and climate, from five to ten tons of the most nutritious fodder, per acre, which in feeding value, ranks with sorghum, and it is greatly relished by all classes of stock, which prefer it to paspalum. It produces a large quantity of seed which can be harvested easily, and if necessary at any time it can be ploughed out without much trouble.

The farm is a little world to itself, in which every field is a continent, every pond an ocean, every building a city. And every farm has its north pole—that is, the highest point of achievement—yet to be discovered.

Heavy rains are not good for the manure—except when the manure is under the ground.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Dodder.

In a recent issue of the Cultivator a subscriber gave his method of killing dodder in alfalfa. He stated that he burned the infected places with dry straw, and said that of course it would kill the alfalfa as well as the dodder.

My method of killing dodder is radically different, and it is very successful.

First I mow the spot infested as close to the ground as possible. Then with a fine tooth rake I rake the alfalfa, together with as much dodder as can be removed from the stubble in this way, into the center of the spot. As soon as dry this can be burned, or if the dodder has not seeded, it can be removed anywhere at once. I now take a gasoline torch—such as is used by electricians, plumbers, etc., and burn all the dodder in sight. These spots should be examined again in from three to six weeks to see that no dodder has been missed. I treated one spot, one rod square, that was simply matted with dodder. This spot bore its full crop of alfalfa just as soon as the uninfested part of the field. Three months later I could find no dodder there. I burned once only. In no case have I been able to see that the alfalfa was injured by the use of the torch.—D. D. Powell, Morganhill.

Milk Closer.

Our cow is in best of condition, but occasionally without apparent reason one of her teats will cake and the milk be thick like custard. Sometimes one quarter is affected, some times another. The trouble lasts a few days then she seems all right.—D. G., Pomona.

The milking is at fault more than likely in this case. After the cow has been milked strip the teats thoroughly until no more milk flows. We would discharge a milker that let this occur the second time in a cow already milking. The only time when it should be overlooked is in a fresh cow. When the trouble occurs again give her a pound of epsom salts with an ounce of ground ginger. But stop its coming on, as it is needless to have it come often.—M. E. S.

Best Dairy Breed.

What do you consider the best breed for dairy purposes? How much milk should the average cow give to be profitable? Cows I now have are giving from one to two and a half gallons and this seems to me very light. They are in pasture during the day and have alfalfa hay morning and night.—H. G., Santa Ana.

I do not know which is the best breed of milk cows. Indeed I believe every one of the four great dairy breeds has cows of great value. The breed question must come down to the breeder's choice and to the feed he can obtain cheapest. In the milk herds supplying milk for city use if the cow averages 27 pounds a day of 3.4 milk it is a good one. Some few do better but most fall under this amount daily.

The milking of these cows is not heavy and unless it is extra rich, they are not at all fancy milkers. If you could wet the alfalfa hay and cover it with a sheet in the morning, by night is would be soaked and if fed to the cows should increase the milk flow considerably. In making any change like this do it slowly for it often throws cows completely off their feed to make sudden changes. I would give them this for a couple of weeks and watch results. If they are far along in milking it will hardly help them much. Fresh cows it usually pushes right up into a good flow at once.—M. E. S.

Cascara Sagrada.

Mr. A. Burkhart of Shoemaker, Los Angeles county, recently brought to the office a twig of a bush growing on the northern side of the Sierra Madres at an altitude of about 5000 feet. He told us the bush ranged from six to eight feet in height with holly-like berries ripening in July. The leaves are smaller but shaped somewhat like the oak. This twig was submitted to the Cultivator botanist who writes:

"This is one of the southern forms of Cascara Sagrada. It is botanically known as Rhamnus crocea var. ilicifolia. It is commonly used by the Mexicans as a purgative."

Date Palms.

How can I raise date palms? Have two started from seeds.—Subscriber, Calistoga.

The culture of the date palm, by which we presume our subscriber means a seedling from the commercial date, or Phoenix dactylifera, is very simple if he wishes it only for an ornamental plant, as is also the case with the Phoenix canariensis, commonly called the date palm and a close relative to it. To raise for fruit is another question and would very likely be impossible at Calistoga. The seedlings would probably be of no value in any section, for the date is unisexual, that is, the fruit bearing tree must be fertilized from the male tree. Therefore seed which have been planted may or may not produce bearing trees. If an ornamental palm is desired, the Phoenix canariensis which does not bear edible fruit, is much handsomer than the dactylifera produced from seed of commercial date.

Squash Bugs.

I send in small box bugs which are eating the life from my pumpkin vines. What are they? There are millions of them.—W. T., Atwater.

See answer to query "Squash Bugs" on Page 67 of Cultivator of July 21st.

Pruning Apricots.

Is this the proper time to prune apricot trees or should I wait until the leaves have all dropped? I understand some people prune as soon as they pick the fruit. How much of this year's growth should I prune off and how long should the laterals be left? Of course I understand the general shaping and balancing of the tree.—Subscriber, Saticoy.

The question of pruning is too extensive to go into at length in this department. Later we will consider it in the deciduous department. The apricot is somewhat different from other trees in this, that it bears its fruit on both the older and young growth. The plum, apple, pear and cherry bear fruit on wood of two or more year's growth; the peach on wood of last year's growth. The apricot combines the two. Nevertheless fresh new wood is essential for largest and best growth. To secure abundance of new wood winter pruning is wise. Some growers cut off severely at the winter pruning. If trees are pruned as soon as fruit is taken off and this is followed by irrigation, young wood is thrown out and healthy fruit buds are formed which will give larger and finer fruit than is produced from the older wood. Whether it will be wise to prune this late we are not certain, as it would depend upon locality, but if done at once it might result in good returns.

Seed Bed Stock.

I have orange seedlings planted in bed March 1910 which have reached the height of 18 inches. Will it be safe to plant them in nursery form this season?—Subscriber, Exeter.

Seed bed stock which has reached such a height since March has certainly made extraordinary growth and we doubt not has not yet had time to harden. Therefore, to plant at this season in an arid climate would be attended by many difficulties. If the nursery row could be covered with lath so as to protect from the sun's heat and abundance of water be used at the right time, it is possible they would take root and harden the wood before the cooler weather. We cannot, however, believe otherwise than that early March planting of this seed bed stock in nursery row would be preferable. If this is done a slight reduction of moisture in seed bed might prevent such strong growth and put them in better condition for the cold weather.

June Beetles.

I am sending specimen of beetles which are on our cherry trees. What is it and how may we get rid of it?—Subscriber, Beaumont.

This is the June beetle and as a rule does not do sufficient damage to make treatment of trees necessary. It is a biting insect and consequently may be poisoned by spraying trees with Paris green or other arsenic mixtures. If the trees are young and the beetle is doing considerable damage, we would do this at once, but on larger trees would not. Another good remedy would be to turn the poultry under the trees.

Squirrel Poison in Oranges.

I have been very much interested in reading in the Cultivator of ways and means to exterminate squirrels. I will give your readers a bit of my experience. While preaching at Bloomington several years ago, the squirrels formed an extensive colony in front of the parsonage barn, in a vacant lot of about five acres. Finally they began to dig under and come up in my barn after my hay and grain. One day I heard a man say that he thought squirrels liked oranges, for he saw one run across the road in front of him with an orange in its mouth. Immediately I procured a few oranges, took off the rind and cut the pulp in small pieces. Into the juice of these pieces I inserted a small dose of strychnine poison. I placed two of these pieces in each hole and never saw but one squirrel after that. One treatment killed the whole colony. About a month after, I saw one squirrel sitting on the top of one of the mounds (I think he was a stray one). I put a piece of orange in the hole into which he ran and never saw another squirrel while I remained in the place. The reason I put two pieces of orange in one hole was, because there are never but one pair of squirrels in one hole.—Rev. B. F. Hewlett, Pomona.

Chlorosis.

Please inform me what is the cause of the yellow spots on orange leaves I send. Could this be caused by fertilizer, or will fertilizer be beneficial?—C. H., Redlands.

The mottled and streaked appearance of the leaves in which the rich green has given way to yellow, has caused much discussion and investigation. Explanations are many, and all more or less unsatisfactory. Mr. Snowden has given one article in a recent Cultivator touching upon this subject in which he advocated the theory that excess of magnesia and insufficient lime may be the cause. His remedy—which he frankly says has not yet been proven out in actual practice—is the application of nitrate of soda and superphosphate, or at times a liberal application of gypsum is good. Another article will appear in next week's Cultivator from Mr. Snowden on this topic. Several have maintained that a marle hardpan underlying orchard is sure to cause chlorosis. Fertilizing with stable manure with very deep culture, has at times brought relief; at other times it has failed.

Bleaching Raisins.

Please give me information regarding bleaching of raisins. How large should the vat be made? How much lye should be used? How hot must it be kept? How long should raisins stay in the hot solution? How long will it take to sulphur?—J. P., Kerman.

The size of the vat will depend upon the magnitude of the business to be conducted. We have seen the ordinary iron kettle used, of, say, 50 gallons capacity. Grapes were placed in metal basket and a derrick used similar to the old fashioned well sweep with weight at opposite end to aid in dipping. Usually the small Sultanas or Thompson Seedless are used for this bleached stock. The lye dip should be in proportion of about one pound of lye to 12 gallons of water. This should be kept boiling hot, and the ripe fruit dipped for an instant then plunged into fresh, cold water and thoroughly rinsed. They may be left in sulphur house after placing on trays only long enough to bleach to desired color. If the weather is extremely warm, they may be cured for a very short time in open sunlight, then trays stacked and the fruit dried more slowly. This gives a beautiful amber color. If the weather is moist, they may be left spread much longer.

Swelled Head.

Can you give remedy for swelled head in turkeys?—W. S., Kerman.

This swelled head is sometimes caused by too closely confining turkeys at night so that they breathe foul air. Again, there is another trouble caused by fleas, in which the heads swell and get scabby and unsightly. For simple swellhead, a dip into a two per cent solution of permanganate of potassium holding the

(Continued on Page 119.)

WHEN "TOM SAWYER" WAS WRITTEN.

In his reminiscences of Mark Twain in Harper's for August, W. D. Howells tells of the time when Mr. Clemens wrote Tom Sawyer and brought the manuscript to him for criticism.

"I am surprised to find from the bibliographical authorities that it was so late as 1875 when he came with the manuscrip of Tom Sawyer, and asked me to read it, as a friend and critic, and not as an editor. I have an impression that this was at Mrs. Clemen's instance in his own uncertainty about printing it. She trusted me, I can say with a satisfaction few things now give me, to be her husband's true and cordial adviser, and I was so. I believe I never failed him in this part, though in so many of our enterprises and projects I was false as water through my temperamental love of backing out of any undertaking. I believe this never ceased to astonish him, and it has always astonished me; it appears to me quite out of character; though it is certain that an undertaking, when I have entered upon it, holds me rather than I it. But however this immaterial matter may be, I am glad to remember that I thoroughly liked Tom Sawyer, and said so with every possible amplification. Very likely, I also made my suggestions for its improvements; I could not have been a real critic without that; and I have no doubt they were gratefully accepted, and I hope never acted upon. I went with him to the horse-car station in Harvard Square, as my frequent wont was, and put him aboard a car with his MS. in his hand, stayed and reassured, so far as I could, concerning it. I do not know what his misgivings were; perhaps they were his wife's misgivings,. for she wished him to be known not only for the wild and boundless humor that was in him, but for the beauty and tenderness and 'natural piety'; and she would not have had him judged by a too close fidelity to the rude conditions of Tom Sawyer's life. This is the meaning that I read into the fact of his coming to me with those doubts."

TRIANGLE TRIP.

Ask Agent For Particulars. Triangle Trip Over The Northwestern Pacific Railroad.

One of the most delightful scenic one-day jaunts in America.

One hundred and fifty miles of mountain and redwood forest scenery, a boat ride on San Francisco Bay and along the Russian River.

Leave San Francisco at 8:45 a.m. daily (and 6:45 a.m. Sunday only) by boat across the Bay of San Francisco, in full view of the Golden Gate to Sausalito, (the Sorrento of America). Thence via picturesque San Rafael and thriving Petaluma (home of the chicken industry), through Sonoma Valley to Santa Rosa and Fulton. From Fulton through magnificent mountain scenery and redwood forests, and along Russian River to Monte Rio. Return is made along the coast, passing Tomales Bay, Point Reyes, San Anselmo, etc., to Sausalito, arriving at San Francisco at 7:35 the same evening.

If preferred, trip can be reversed, leaving San Francisco at 8:15 a.m. via the Coast to Monte Rio and returning along the river and through the valleys, arriving at San Francisco 7:05 same evening. On Sundays an extra train arrives at 9:05 p.m.

Round trip fare for Triangle Trip, $2.80, except on Fridays or Saturdays, it is $2.50 and on Sundays only $2.20.

LIVE STOCK.

JERSEY CATTLE FOR SALE—REGistered heifer calf, well bred, $25.00. Unregistered bull calf, $10.00. Unregistered yearling bull, $35.00. HENRY H. JAMES, proprietor Franklin House, Fair Oaks, Sac. Co., Cal.

REGISTERED SHORTHORN BULLS and Poland China Hogs for sale. Best breeding. P. H. MURPHY, Perkins, Cal.

DAIRY SUPPLIES.

MILK COOLERS, BOTTLES, CAPS, brushes, Buhl milk cans, Sharples separators, Babcock testers, veterinary instruments, wood soled boots and shoes, and our celebrated "Prosperity" washing powder. GUY F. KELSEY, 108 E. 8th St., Los Angeles, Cal.

FARM LANDS FOR SALE.

FOR SALE—OWENS RIVER VALLEY. We are preparing to place upon the market 1000 acres of the choicest apple land in the Owens River Valley, which will include one of the most remarkable gravity water systems in the State. This land is wonderful in its productiveness beyond all belief; potatoes that run 500 bushels to the acre, alfalfa three tons to the cutting, timothy with 12-inch heads, the world's fair prize for honey, and last but not least, the finest apples grown on the Pacific Coast. Red winter apples that look like wax. No other land in California to compare with it. Not flat valley land, but foothill land with gentle slope, giving perfect drainage. The choicest apple land will be subdivided into tens, twenties and forties. The most wonderful scenery in America. Fishing and hunting in the high Sierras right at your door. Trout streams within walking distance. Southern Pacific's new main line east now building through valley, but will not be finished until spring, when this land will be formally open for inspection. In the meantime send in your name and address for booklet, plats and price list, which will be mailed to you as soon as they come from the press. This land is not for speculators but for real serious farmers who know the virtues of choice land, water and climatic conditions when they see them. Will make a special and attractive proposition to buyers who will go in this summer and start their improvements before the formal opening in the spring. Will be glad to take a few serious people with me on my next trip into the valley. JAMES R. H. WAGNER & H. S. COOK, 825 Wright & Callender Bldg., 4th and Hill Sts., Los Angeles, Cal.

FOR SALE—"WILLOWLAKE STOCK Ranch," comprising 332 acres. One mile from Santa Fe, 6 miles from Southern Pacific at good towns. Fifty acres in lake 20 feet deep, stocked with fish and ducks in season; 80 acres alfalfa; 65 acres in raisin grapes; 15 acres in peaches; 65 acres extra good alfalfa land to be planted coming year. Balance pasture around lake. Domestic wells, canals for irrigating. Completely fenced for stock. North quarter hog tight, in good condition. Six-room modern cottage with bath. Bunk houses, store rooms, barns, cow sheds, hog pens, corrals, machinery, tools, milk cans, separtors, wagons, harness, etc.; 11 horses, 23 cows, 9 heifers, 100 hogs, shoats and pigs, including 15 brood sows. Free delivery. Write for terms. PARRISH BARKER, 207 Union Trust Bldg., Los Angeles, Cal.

FOR SALE OR EXCHANGE—630 acres in the famous Rogue River Valley, Oregon, the home of the Red Apple," where orchards are selling at $2000 per acre; 15 miles from Medford, 3 miles to railroad. House, barn and other out-buildings. 90 acres fenced, 80 acres timber, oak and pine, all subject to irrigation. Rogue River runs along one side, high banks. For want of means I am unable to develop it. Can be made to pay 100 per cent on investment inside of two years. Price $50 per acre, one-third cash, balance long time at 6 per cent. Would consider Southern California, city or country. Address owner, D. G. FITZ, Box 272, Central Point, Ore.

FOR SALE—815 ACRES IN SAN LUIS Obispo County. A typical dairy ranch. Plenty of wood, water, irrigable land, buildings, fenced and cross fenced. Orchards, vineyards, oranges, lemons and walnuts do exceedingly well here. 40 acres of land suitable for these. Price $21 per acre. For further particulars apply to MRS. F. A. CLINK, Pozo, Cal.

2285 ACRES CHOICE, DEEP, SANDY loam. Ideal for subdivision or Eucalyptus growing. Can be cultivated any day in the year. Southern Pacific Railroad runs through the ranch. Also close to deep water for shipping. Free from wind and frost. Now all planted to grain. Price $100,000.00 for limited time. GEO. W. SILL & CO., Watsonville, Cal.

IRRIGATED LAND FOR SALE, cheap. In the Lower Rio Grande Valley of South Texas. Ideal climate. Good markets. Large crops. Special inducements to several practical irrigation farmers. Address MANAGER, care of Cultivator, at once, or AMERICAN RIO GRANDE LAND & IRRIGATION CO., Mercedes, Hidalgo County, Texas.

APPLE ORCHARDS, LARGE AND small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. GEO. W. SILL & CO., Watsonville, Cal.

FRUITS, FLOWERS, SUNSHINE, progress—all these invite investigating beautiful Hemet Valley, Southern California. Booklet free. WILLIAM KINGHAM, Hemet, Riverside County, Cal.

FOR SALE—EL CAJON GRANT LAND. In the heart of El Cajon Valley, 30 acres of choice vineyard, large house, cottage and barn; trays, boxes, etc. Close to proposed electric line. S. B. HAWLEY, 1548 D. St., San Diego, Cal.

Your Greatest Help in Reducing the Cost of Living is OUR SPECIAL GROCERY CATALOG

THIS BOOK FREE

52 pages of vital importance on how to save money by buying from the Largest Mail Order House in the West

Our Special Grocery Catalog is a bulletin of bargains, printed solely and exclusively for **you. This book** is filled with quality goods at bargain prices. Any page you turn to will disclose at least one such bargain that will actually fit into your house. **Now, today. Why?** Because, being the largest complete mercantile establishment on the Pacific Coast gives us such facilities as are not enjoyed by any other general merchandise house or retailer, and, with our complete equipment, enables us to serve the buying public to the best possible advantage. Our prices are one-fourth to one-half less than any retailer's. If his price is $10 for an article, you can buy the same thing of us through our catalog for $7.50 or less. This applies to all classes of goods.

It Will Pay You big to buy all or as much of your goods as possible through our catalog. Besides the great saving you can make by trading by mail, it is the easiest and most satisfactory way of buying goods.

Our Guarantee is to safeguard your interest to every extent that we will give the service you have a right to expect. We stand back of every statement we make, and if there is the slightest dissatisfaction because of quality, style, size or color, or for any other reason, we expect you to return the purchase to us at our expense.
Don't wait until tomorrow, write today for our Special Grocery Catalog.
Our unqualified guarantee—"Satisfaction, or Your Money Back."

Write today for this Book It costs you nothing and saves you Money

The Tee Irrigating Valve

Simple in design and construction, costs less and will last longer than any other on the market.
The Tee Irrigating Valve is made of an ordinary malleable iron T with a brass plug. It is designed for those who want an inexpensive irrigating valve, especially where such valves are needed in large quantities. There is nothing to get out of order. It is so simple you will wonder why it was never thought of before.
A ½-inch valve sent post paid upon receipt of 40 cents. Quantity price, circular and full information upon request.
Address **George C. Roeding, Fresno, California**

UNAFRAID.

Who's afraid of a cow!
They're so gentle and kind
You can go up quite close and they none of 'em mind.
An' they like little girls' so I've heard people say—
But I wish, oh I wish they was furder away!

Pooh!—who's afraid?
They're as good as can be,
An' one's a child cow that is younger than me.
An' they give us good milk—an' there's nothing to fear,—
But I wish, oh I wish that my Daddy was here!

—Burges Johnson, in Harper's Magazine for July.

HE HELPED TO FINANCE THE REVOLUTION.

AT the corner of Rue Beauverger and Rue de la Halle in Havre stands a three-tsoried house of gray stone, with a sloping slate roof and high chimneys, topped by picturesque pots of clay, discolored by time, smoke, and the elements.

In this now dilapidated structure of slate and granite were, from 1776 to 1792, the officers of Pierre Augustin Caron de Beaumarchais, who spent a fortune during our Revolutionary war in providing the Americans with guns, ammunition, and supplies of every description. Indeed, it is safe to say that without his aid the colonists could not have carried on the conflict.

Rochambeau and Lafayette lent their swords to the United States; Beaumarchais sent supplies to the value of 5,000,000 francs. It is true that these material and metallic sinews of war were not a gift, for Beaumarchais was a merchant, and sent them to the United States with the understanding that they should be paid for in time. That he was far from pressing in regard to his bill is proved by the fact that it was never paid during his life.

After the conclusion of the war Beaumarchais repeatedly claimed from the United States the 5,000,000 francs which his books and accounts showed were due to him. He received hopeful assurances and offers of a compromise in turn, until Alexander Hamilton, who had been authorized by Congress to arrange a settlement, proposed on a basis of 2,280,000 francs. It is probable that Beaumarchais would have accepted this could he have obtained it, but he died in 1799 without ever having received a penny.

Four years before his decease, chagrined by repeated disappointments and blasted hopes, exiled by the French Revolution, and living alone in a Hamburg garret, he wrote the following letter to the American people.

"Hamburg, April 10, 1795.

"Americans,—I have served you with a zeal that has been unswerving. I have received in return—nothing! I am today your creditor.

"Permit me, before dying, to leave my daughter to your care and consideration, with the request that you give her for a dower what you owe her father. Perhaps, after I can no longer defend her against the bitter injustice of the world, she will be left penniless, and perhaps the hand of Providence, foreseeing this, has wished, by repeatedly retarding the discharge of your indebtedness to me, to provide for her after I am gone."

In 1824, and again in 1835, this daughter went to American to claim the amount due.

In the latter year she was offered 800,000 francs ($154,400), and took it as her sole heritage.

It was all that remained of a large fortune spent in the cause of liberty. —John Preston Beecher, in Harper's Magazine for August.

FOOD.

Rational living on the farm or in any other community presupposes a reasonable variety of well-cooked foods of good quality with the various sorts in suitable proportion. In many homes the housekeeping is needlessly complicated and the result obtained is out of proportion to the labor expended. In other homes, particularly where the variety of easily obtainable foods is limited and the proper preparation of foods is not given due attention, the diet is too monotonous to be satisfactory or is so prepared that it is not well suited to the family needs. The question of lessening household labor by avoiding unnecessarily elaborate dishes and meals is discussed in the Cornell Agricultural College and Experiment Station publication referred to.

In our own country the difference between the present table and that of the pilgrim fathers is so great as to account to some extent for the present lack of leisure of the housewife. To fish, brown bread, pork and beans, vegetables, have been added the present salads, ices, elaborate puddings, cakes, and the many forms of dessert. In the earlier times * * there was a regular baking day, when large quantities of baked beans, pies, and bread were prepared.

The baking day and the preparation of large amounts of food at one time, with the consequent economy of labor, are much less common than was once the case. Changes in customs and standards of living and a more varied food supply have led to the selection of many dishes which are best if freshly prepared and to menus which are very often needlessly elaborate. All this means added work for the housekeeper. The careful selection of food and the planning of meals will do much to lessen household labor, and if this is done with due reference to nutritive value of foods and wholesome combinations the results will oftentimes be more satisfactory than is at present the case.

All are coming to know that simpler living is necessary, not only for the comfort of the housekeeper but for those who sit at her table. Elaborate menus are entirely impossible when one woman does all the work. * * * The elaborate meals and the unnecessary dishes are not for the good of anyone. They interfere with the beautiful grace of hospitality; they prevent the happiness of the cook and the preservation of her strength. Simple, wholesome meals, with intelligent cooking and serving, are a blessing to any household.

In homes where the diet is too monotonous and the preparation of food is not in accordance with right standards of living, the knowledge of proper methods and ways of utilizing available food supplies will result in a much more satisfactory diet with the same amount of labor, or indeed oftentimes with less expenditure of time and energy.

Commenting on the lack of variety in food noticeable on many busy farms and ways in which it may be obviated, Professor Day makes the following statement: "Most farmers have to depend on chickens for the greater part of their fresh meat, and unless one is in the poultry business the care of chickens is another burden added to the household." The increased time which labor-saving devices in the home and convenient construction of the farmhouse make possible would give the farmer's wife time for her poultry, and then poultry keeping need not be a burden. There should certainly be no lack of fresh vegetables on the farm, but frequently the farmer can not give the necessary time to the kitchen garden and the farmer's wife is unable to find time for gardening, though most women doubtless consider gardening a recreation rather than a task. "If only the men can do the first hard work in the garden they will see that the women will welcome the opportunity for work out of doors among the green things, and will be the better for it physically."

The above statements make it plain that if the diet is out of harmony with rational standards, either because it is too elaborate or because it is too monotonous or unsatisfactory in other ways, it is possible by the application of knowledge now available to improve conditions and at the same time lessen the housewife's burdens.

In few departments of home life has there been so much improvement in the last one hundred years in the economy of labor and fuel and in scientific methods as in cookery. It remains, therefore, for the housewife to take advantage of the gain in time and labor to study the kind and quantity really necessary, and the best and simplest way of preparing food, in order that she may have time at her disposal for the other duties in and out of the home and to add to her own leisure and means of self-improvement.—Exp. Sta., Bulletin 3

POUNDED MEAT.

Pounding meat before cooking is an old-fashioned method of making it tender, but while it has the advantage of breaking down the tough tissues it has the disadvantage of being likely to drive out the juices and with them the flavor. A very good way of escaping this difficulty is pounding flour into the meat; this catches and retains the juices. Below are given the recipes for two palatable dishes in which this is done:

Farmer Stew.

Pound flour into both sides of a round steak, using as much as the meat will take up. This may be done with a meat pounder or with the edge of a heavy plate. Fry in drippings, butter, or other fat in a Scotch bowl, or if more convenient in an ordinary iron kettle or a frying pan; then add water enough to cover it. Cover the dish very tightly so that the steam can not escape and allow the meat to simmer for two hours or until it is tender. One advantage of this dish is that ordinarily it is ready to serve when the meat is done as the gravy is already thickened. However, if a large amount of fat is used in the frying, the gravy may not be thick enough and must be blended with flour.

Spanish Beefsteak.

Take a pieec of round steak weighing 2 pounds and about an inch thick; pound until thin, season with salt and Cayenne pepper, cover with a layer of bacon or salt pork, cut into thin slices, roll and tie with a cord. Pour around it half a cupful of mi and half a cupful of water. Place in a covered baking dish and cook two hours, basting occasionally.

FOR POST CARDS.

Here is a hint for those who have pretty foreign post cards to dispose of: A high threefold screen of plain green burlap was purchased and a narrow strip of black oak run across each panel about two-thirds of the way up. On the space above the tinted cards were prettily arranged, fastened with stationer's glue, and looking like bits of mosaic on the dark background.

THE WISE PHYSICIAN.

"The doctor has ordered me to eat only the plainest food."

"For how long?"

"Till I have paid his bill, I guess."

"Charity is the mother of joy and brings happiness—alike to the giver and to the receiver."

The trouble with cute children is they soon outgrow it and become impudent.

NO RUBBING!
No Hard Work
No more drudgery on wash day.
We Convince You at Our Expense
Write at once for a FREE package—enough for three washings. They will not harm the most dainty fabric. Every housewife can do her own washing with Champion Tablets—they make wash day a pleasure. Send us your grocer's name and 5c stamps to cover mailing.

Get a Business Education
AT THE
Polytechnic Business College

The Question Is:
Can I Get a Position When My Course is Finished

This is the question in the minds of young men and women throughout the West. It is a plain business proposition with most of them. They have the desire to secure a business education, and the ability and ambition to qualify themselves, but they hesitate because of a feeling of uncertainty as to a position. NOW, what We want to do is to submit the most convincing argument to the effect that ambitious young men and women who receive a thorough training at the POLYTECHNIC BUSINESS COLLEGE have no difficulty in securing a paying position.

We wish to emphasize the statement that EVERY GRADUATE OF OUR COMPLETE BUSINESS TRAINING COURSE FOR THE PAST TWELVE YEARS HAS RECEIVED REMUNERATIVE EMPLOYMENT,

We wish also to submit below a partial list of our recent graduates who have secured positions. What they have done others can do.

Alma Allen, W. S. Withers, Real Estate, San Francisco.
Emma Arada, Dalton Adding Machine Co., San Francisco.
B. H. Binford, Pacific Coast Refineries Co., Oakland.
Margaret Barry, Underwood Typewriter Co., City.

San Francisco and Los Angeles Produce Markets

Los Angeles Markets

LOS ANGELES, Aug. 3, 1910.

Butter.

Butter advanced one point yesterday, which is in advance of San Francisco. Market is very firm.

Price to trade 2½c in advance of the following Produce Exchange quotations:

Extras	32½
Firsts	30
Cooking	23½

Cheese.

Northern fresh	16½@17
Anchor, large	18
Oregon Daisy	18½
Imported Swiss	28@30
Domestic Swiss	23@25

Eggs and Poultry.

The recovery of eggs is more than made during the week and they are now materially above last week's quotations, with firm condition prevailing.

Paying price f. o. b. L. A. is:

Local ranch candled	33
Case count buying price	29
Eastern fresh	27
Eastern storage	25

Dealers pay for live poultry f. o. b. L. A.:

Hens, per lb.	15@17
Roosters	9
Broilers	16@17
Turkeys	22@24
Geese	12
Ducks	14¼
Pigeons, doz.	75

Live Stock.

The following quotations are f. o. b. Los Angeles, on all stock:

Hogs, 175 to 200 lbs.	9½
Prime Steers	5
Heifers	4@4½
Calves, per lb.	5¼
Sheep ewes, per head, shorn	4.00@4.50
Lambs, per head	3.50
Wethers, shorn	4.00@4.50

Potatoes.

Wholesale prices are:

Highlands	1.50@1.60
New potatoes, per ctl.	1.35@1.50
Sweets, Yellow, per lb.	3@3½

Onions.

Wholesale quotations:

Silver Skin, per ctl.	2.50
Yellow Danvers	2.00
Local Reds	1.75
Garlic	7@8

Vegetables.

Wholesale quotations:

Asparagus	10@12
Artichokes, northern, doz.	90
Beets, sack	90
Beans, green and wax	3½@4
Beans, Limas	5@6
Brussels Sprouts	10
Bell Peppers	6
Green Chilis	10@12
Cabbage, per sack	1.50
Cucumbers, per box	35
Celery, crate	4.35

Hops, 1908 crop	8@10

1910 contracts now being made at 12 @14 cents.

Honey.

White comb	14@15
Amber	10@12
Extracted W W	7½
Extracted light amber	6½@7
Beeswax, per lb.	24@30

Hay.

Scott, Magner & Miller report:

Arrivals of hay for the week have been 4600 tons, which is a little increase over the arrivals of last week. Market conditions have not changed to any noticeable extent, excepting that it is a little more difficult to effect removal of the medium classes of hay arriving daily by the cars and boats. A fancy type of hay sells readily.

The trade generally complains of the lack of any activity in the business, which at this time of the year has formerly been the busiest of the season.

The railroad companies have not been able to supply the shippers with the necessary cars to move into market the large lots that have been purchased through many of the districts, and if enough cars had been available this market would have received a great deal more hay and it is thought that prices would not have been as well maintained. There has been some hay shipped recently for export to Hawaiian Islands and to Manilla, which has relieved the market in a certain way to a small extent.

Fancy wheat	12.50@13.00
No. 1 wheat or wh and o.	11.00@12.00
No. 2 wheat or wh and o.	9.00@10.00
Choice tame oat	11.00@12.00
Other tame oat	8.00@10.00
Wild oat	7.50@9.50
Stock hay	5.00@6.00
Alfalfa	6.50@10.30
Straw	40@55

Grain.

Wheat No. 1	1.62½@1.67½
Barley, good to choice	1.07½@1.11¼
Barley, poor to fair	-1.00@1.05
Oats, white	1.42½@1.47½
Rye, new crop	1.50@1.60
Corn, large yellow	1.55@1.60

Middlings	32.00@34.00
Oil cake, per ton	38.50@40.00
Cocoanut cake per ton	25.00
Mixed feed, per ton	24.00@30.00
Shorts	24.00@26.00

Deciduous Market

SACRAMENTO, July 30, 1910.

The following circular of the California Fruit Distributors gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday, July 29, 1910.

Peaches.

Three hundred and forty-four and three-fourths cars. Another heavy gain in the shipment of peaches is shown this week. Large quantities have been sold in the f. o. b. territory and the demand continues all that could be desired. Auction markets also are doing very much better. Heavy shipment has now been made and it is expected that receipts will drop off quite rapidly from this time on until Salway season opens about the middle of August.

Plums.

One hundred and twenty and three-fourths cars. As expected, movement of this fruit has fallen off materially and will continue to decline for the next ten days. Giant, Gros, Hungarian, Kelsey and Grand Duke are practically the only varieties now available.

Pears.

Three hundred and eighty-nine cars. Shipment of this variety shows a slight falling off, but not nearly so much as was expected. It may be stated that the Sacramento River section is now done and by far the greater portion of the shipments are coming from outside points where the crop is rapidly nearing its close. The quality of the fruit was never finer.

Grapes.

Fifty-seven and three-fourths cars. Thompson seedless grapes are now going forward in considerable quantities and there have been a few cars of Rose of Peru sent out. Some Malagas from the earlier sections have also gone forward. Movement of all these varieties will show considerable increase during the coming week.

Weather conditions have remained very favorable since our last report. All fruits are developing finely and grapes in particular promise to be of unusually good quality. There is no question but that the crop of Tokays has been shortened up materially by the very hot weather that we had earlier in the season. It is impossible at this time to accurately estimate the amount of damage, but it will certainly have its effect on the output.

Citrus Market

LOS ANGELES, Aug. 3, 1910.

The situation as to Valencias is very avorable, though some embarrassment s caused by the disposal of excess of mall sizes. Prices are running practically as last week, with not far from 500 cars yet to go. Shipments are ow averaging about 45 cars daily.

The lemon market is still stronger han last week, influenced principally y the warmer weather of most eastern sections; also in part by shipments eing somewhat less than anticipated. The shipments are in fact materially ower than last year, which was not up o standard. The promise for a large all pick is not the best ,so there will e no question that all which will be ut from now on will command satisfactory price.

hipments.

Total shipments of citrus fruits to date since November 1, 1909: 27,671 ars, of which 23,678 were oranges and 993 were lemons. To same date last eason, 34,366 cars, of which 29,028 were oranges and 5338 lemons.

NEW YORK, Monday, Aug. 1.—Thirteen cars oranges and 1 car lemons old. Market steady or oranges, firm n good stock lemons. Clear and warm.

Queries

(Continued from Page 114.)

head under until the bird strangles, is about as cheap and reliable a cure as can be found, treating it twice a day until cured, and anointing the head after each treatment with camphor salve, weak: say an ounce of camphor gum to 16 ounces of vaseline, or in that proportion, melting the vaseline and adding the gum, keeping hot, but not boiling, until the gum is dissolved. This is a very excellent salve to have handy, anyway, and will pay to make, even if the price of camphor gum does take your breath away. The permanganate alone will cure, but takes time, and the camphor salve will hasten the cure, at the same time allowing the bird to swallow a little of the permanaganate solution. To make the solution put five cents' worth of the permanaganate in a quart of warm water, and shake it occasionally until disolved, then pour off a tablespoon to a teacup of water and dip.

Another good dose is boracic acid. Pour boiling water directly on the powdered boracic acid until the water will take up no more of the powder. Cool enough not to blister and apply with cotton batting, keeping two pads of the batting, applying them alternately as fast as they dry, and you will find the swelling will go down like magic. Then dry and apply the salve, and I think your turkeys will soon be better, especially if they have plenty of fresh air at night.—Mrs. Metcalf.

Profit from 2000 Chickens.

How much can I net from 2,000 hens if I do all the work and buy feed in several ton lots and exercise great care to secure good stock? Chickens will have range over 15 acres of lemons fenced off in four or five different lots. Would that be range sufficient for 2000? What variety would you advise?—Subscriber, San Diego.

How much any man will make, or lose, on 2000 chickens, or any other number, it is impossible for any one but the man himself to say. Some have tried to establish the claim that each hen is good for one dollar net profit each year, and in small numbers have made more than that, and yet others with large numbers, have lost money and gone broke. It is a business proposition the same as the grocery, the bank, or any other, and its success or failure depends upon judgment and ability to work hard. As to the best breed, that, like the other question, depends upon the man. Whichever of the standard breeds he will take most pride and pleasure in will probably net good profit if he gives them intelligent care and buys his supplies at rock bottom prices at the season of the year when they are cheapest. Fifteen acres is sufficient range for 2000.

Business Notes

NITROGEN—THE INDISPENSABLE.

The great fight of the farmer in every corner of the earth is for the acquisition and conservation of that most important to agriculture of all the elements—Nitrogen.

According to Snyder about two per cent of the soil nitrogen is ordinarily available. Many grain crops cause a loss of more of it than is used by the crop, while one year of fallowing land has caused a loss of five pounds of nitrogen for every pound made available. Organic manures, unless well-rotted, dissipate some nitrogen probably through the oxidation of a portion of the organic matter.

It therefore behooves the farmer to exercise a wise discrimination in the choice of nitrogenous manures.

"A long list of experiments," says the author of Saline Deposits of California, "carried out in many places shows that nitrate of soda is the best source of nitrogen for the orange."

Nitrate of soda plays a double role in its deportment in the soil. Besides furnishing the best as well as the cheapest nitrogen for the farmer, the claim long made that it renders the native supplies of potash in the soil available has been experimentally proved in the laboratory of the Nitrate Agencies Co., in Los Angeles. A soil containing 0.37 per cent potash yielded to solution of nitrate of soda 0.11 per cent or nearly a third of that potash.

When it is remembered how much potash some soils contain—e. g., 1.14 per cent in the "fine earth" of a certain soil of the San Gabriel Valley—the importance of this property of nitrate can hardly be overestimated.

ADVANCING.

The Polytechnic Business College, Oakland, California, was established twelve years ago and at that time occupied but two small rooms and had a very limited number of pupils. But it has been steadily advancing. The intervening years have been years of patient effort in the preparation of young men and women for the battle of life. That work is going on with increased vigor and better preparation. It has had its reward, for today the Polytechnic College is the largest and best equipped business training school on the entire Pacific Coast. There are always good business openings for its graduates, in fact we are told that the demand for its trained help is greater than the supply.

There is at this time being added an engineering college building. It will be thoroughly equipped with machine shops, forges, electrical laboratory and all necessary tools for teaching engineering in a practical manner.

The school has just issued a new and beautifully illustrated catalogue which gives full particulars concerning the various branches taught by this school. When you write for this catalogue if you will mention the Cultivator it will be sent by return mail. It is an interesting book and should be in the hands of every ambitious young man and woman in the state.

THE LUNGS OF AN ENGINE.

The mixer on a gasoline engine; the carburetor on an automobile and the lungs of a man, are equally important and in each instance fill the same office. That is, they supply the vital power necessary. The human being, of course, requires more air, and the lungs are called upon for more active service when working than in repose, and this supply is so automatically regulated that we seldom give it a thought. The same requirements exist with an engine. As the load is increased, means must be provided for increasing quantity of fuel and air fed to it.

J. B. Seager, general manager of the Seager Engine Works, has hit the nail square on the head with the mixer which he is using on the Olds engines. This is a patented idea of his own and has the distinctive feature of supplying the proper proportion of gasoline and air to the engine without the use of a gasoline pump and without employing a single moving part. The mixer once set, remains in adjustment, and the suction of the engine piston draws in its charge for each working stroke so that the more numerous the strokes the greater the supply.

In its operation it is the nearest approach to the human lungs of any gasoline mixer.

CANNING ORANGES.

It is said that the large meat packers of the country make their greatest profit from what were at one time considered wastes. Our fruit growers have this lesson to learn, for there is a vast quantity of fruit wasted in this state. Canners as a rule demand the very best of our fruits. But a few days ago we saw a new feature in canning of oranges. This is a case where, instead of the finest, culls are used. The oranges are peeled and either sliced or quartered, and, through a new process, their color is retained so that they have every appearance of the freshly sliced fruit. The best part of it is that the canning appliance is a simple one, which may be used upon any ranch. It is called the Bartlett Canner and may be used in canning all fruits. It may be set up in the house or under a tree in the yard, and its working is so simple that many fruit growers have found it most profitable. One lady in the Sacramento Valley writes that whereas the dealers would only offer her a price that would barely pay for picking, she used one of these canning devices and cleared $1000 from her apricots in one season. This appliance is handled by the Canners' Supply Co., 120 North Main St., Los Angeles. It is worth getting further information upon, and a letter to Mr. Stevens, the manager, will receive prompt attention.

MAINSTAY IN THE DAIRY.

Your wellbred cow, if kept in good condition, will respond to feed when giving milk. It is well known that certain foods are milk producers.

On a pasture of green grass the flow will continue much longer than on hay, hence it becomes necessary as the pastures dry up to supply that which most nearly takes the place of green grass. Those fortunate enough to be located near a sugar factory can easily obtain a succulent food at comparatively slight cost.

A prominent dairyman who, if possible, feeds pulp the year around, makes the statement that "sugar beet pulp is the mainstay of the dairy business."

The most profitable milch cow is the one that comes the nearest to milking the year around with only the proper interval before again becoming fresh.

A NEW IDEA.

It is said that there is "nothing new under the sun," but if one will look into the construction of the New Idea Manure Spreaders he will find an idea never yet used in this connection. The Western Implement Co., which has an advertisement in this issue of the Cultivator, is advertising the "New Idea" spreaders. The company has sold a large number of these in California and has some very strong testimonials.

If you are interested you ought to have the very complete catalogue of farm implements it mails free. The address is 131-133 N. Los Angeles St., Los Angeles.

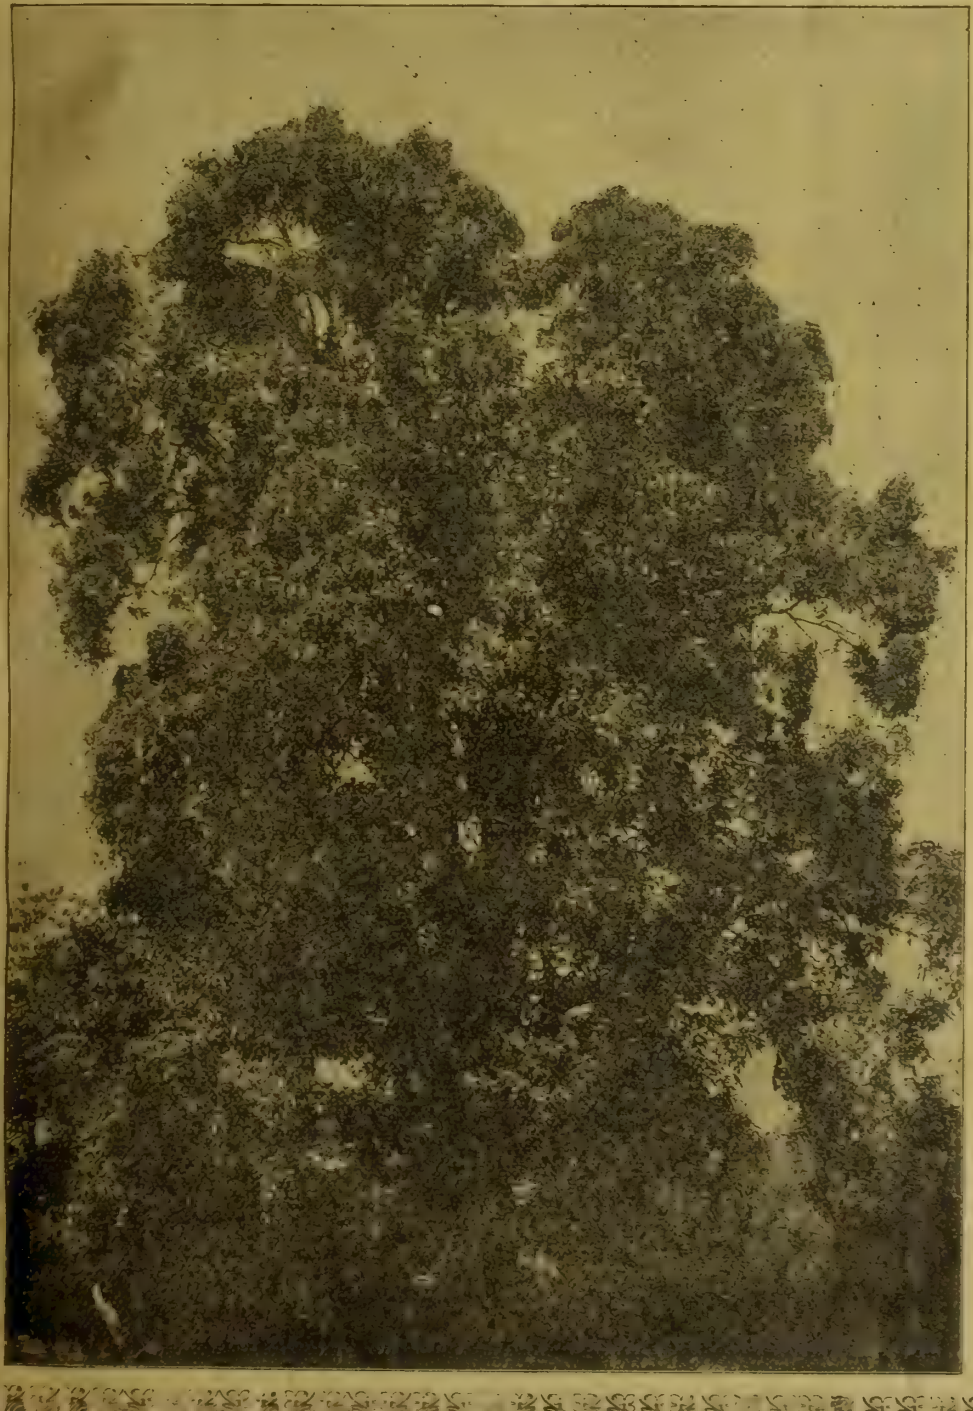
Magnificent Specimen of Hawaiian Island Mango



THE mango tree is an evergreen with a round, dense top, producing small flowers and is a most beautiful tree. It has been grown in Florida and to a limited extent in California for ornamental purposes. It is also proving most profitable in some cases. Most of the trees are seedlings and vary much in the quality of the fruit. The tree is a native of India, where its fruit is a staple article of food during the hot months. In the tropics generally it is eaten raw, either plain or sliced with a sour wine. Some have complained of the resinous or turpentiny taste, even comparing the fruit to a mixture of tow and turpentine, but this is the case only with fruit of a low grade. It was first brought to Brazil in the New World, whence it drifted to the Barbados and later to Florida and California. The trees of Florida were destroyed at the time of the '86 freeze. Two of the trees destroyed by the Florida freeze produced in their eighth year from the seed 19,000 fruits. These were shipped to Chicago and brought in the neighborhood of sixty cents a dozen. This photograph is from a tree in the Hawaiian Islands.

Celery Blight May Be Controlled With Bordeaux

Written by S. S. ROGERS, Expert of Southern California Pathological Laboratory, Whittier

Practical Hints on Methods and Formulas Given.

CELERY BLIGHT is a disease which is well known to every celery grower in Orange county. The cause of the blight is a fungus and there are in the celery fields two kinds, the Summer or Early Blight, Cercospora, and Winter or Late Blight, Septoria.

Early Blight.

This disease is spread quite generally throughout the state, although the loss is very small. It appears on the plants early in the season, generally while still in the seed bed, and the lower outside leaves are usually the first to become infected. From here it spreads on to the inner leaves but is never found on the stalks. On the leaves it is seen as brown spots, and its growth is favored by hot, moist weather. If the disease is serious, spray with Bordeaux mixture at 5-6-50. Thorough cultivation and, in fact, any operation that will favor quick-growing, healthy plants is strongly recommended.

Late Blight.

This disease has caused extremely large financial losses throughout the celery sections of the state, but more especially in Orange county. In this latter place it first began to be of importance in the fall of 1907, and in 1908 the crop was nearly destroyed.

Appearance in the Field.

The lower outside leaves are the first to become infected and from here this disease spreads quickly onto the other leaves and stalks. On the leaves it can be seen in small brownish spots, which later turn black. These spots often form in clusters, but where the leaves are badly affected these clusters cover the entire leaf surface. In many cases, as has already been mentioned, the blight does not only confine its ravages to the leaves but soon spreads onto the stalks. Here again it is seen in small, black spots, often in clusters at first, but later covering the greater part of the stalk, and when this part of the plant becomes infected the prospect for ever producing a marketable product is very slim.

When this disease gains a foothold in the field it spreads very rapidly, especially if the weather is warm and moist, and in a few days a large acreage is destroyed. As would be expected, the blight invariably makes its first appearance in the low, wet, poorly drained spots, and from here soon spreads to other parts of the field.

Control.

The celery plants, where there is any danger from the above disease, should be sprayed with Bordeaux mixture, at least twice while the plants are in the seed bed, especially if they are grown on land on which the celery of the preceding year had blighted. Upon setting the plants in the main field they should be sprayed

(Contnued on Page 138.)

A Practical Experiment in Cost of Production

By AUGUST WOLF, Spokane

DAVID BROWN, president of the Hazelwood Company, operating dairy plants at Spokane, Walla Walla and North Yakima, Wash., Portland, Ore., and Caldwell, Idaho, also more than 100 milk stations between the International boundary and Northern California and Montana and Puget Sound, announces that he will press his request to have the federal goverment delegate a competent investigator to run his business for from 90 days to a year to assist in solving the problem of the present high cost of living in the United States. Mr. Brown has given out this statement:

"Government regulation of business is not coming. The fact is, it is already here. Whether we like it or not we shall sooner or later all have to submit to it. All of the people, as represented by the government, will not continue to permit a few, those who control the business industries of the country, to dictate in large measure, or in any measure, the conditions under which we may live, or the prices which they shall pay for the necessities of life. I recognize this condition and am not only ready, but perfectly willing, to submit to it.

"When a private business grows to such dominating importance that people compelled to do business with it begin to suspect that it is able to dictate the terms upon which that business shall be conducted, it is but natural for the people to begin to look into the methods it employs in conducting its affairs. I do not resent this curiosity. It is the people's business to want to know about how the industries of the country are conducted, and so far as my own business is concerned I am perfectly willing that that curiosity should be gratified.

"In inviting the government to send an agent to take charge of this business I do not expect, of course, that a man will be sent who will look upon it as an opportunity to establish a theory of how business should be conducted. I expect that a competent business man will be sent who can look into it and direct its operation with a view of making the business more useful to the community. What we want to do is to discuss the matter, experiment, if necessary, and work out the best ideas.

"We should begin with the idea that the people must have food. If we are to have food, we must pay such prices for it as will induce those who produce it to continue producing it. I believe we should go a step farther than this. I think that we should so regulate our lives and the prices which we pay for food products that those who produce them can live in comfort, have good homes, live according to a high standard and rear families to be good citizens.

"We must make up our minds to pay the farmer enough for his products that he will be willing to remain on the farm. To do this we will have to pay him enough so that he can live in comfort. Our best citizens come from the farm and we should certainly do nothing as a government or as a trading community which will reduce the supply of these best citizens.

"A business which makes money and destroys the home is not a successful business, from the standpoint of the community and should be discouraged by the community. The industry which helps the most men and women and helps them most in their efforts to procure for themselves good homes, to establish for themselves a high standard of living, and to become good citizens, is the best kind of business for a community.

"The government, representing all the people, should discourage those businesses and those business practices which militate against good homes and a high standard of citizenship, and should encourage those businesses and those business practices which make possible good homes and good citizenship.

"We hear a great deal now-a-days about the undesirable citizen. To my mind the undesirable citizen is the citizen who is unable to or who is not permitted to earn enough to enable him to maintain a high standard of living and of citizenship, and to rear his sons and daughters in such a manner that they will be a credit to the community.

"In this experiment, which I have asked the government to undertake, there are several ways in which benfit might result, both to the company and to the community which it serves. We manufacture butter on what is practically a fixed margin, paying the farmer for the butter fat just one and a half cents a pound less than we get for the butter. The question will be raised whether we are charging too little or too much, whether we are failing to give the producer or the consumer a square deal, and if not, whether the business could not be managed, with a fair profit, and still do so. Other questions are:

"Are we giving sufficient encouragement to the man who milks and feeds the cows? Are we charging the consumer more than he should be charged for the product? Are we making the best product we can practically make, and is it made under the safest and most modern conditions?"

Citrus and Sub-Tropical Fruits

THE MAGNESIA-LIME TROUBLE IN CITRUS ORCHARDS.

By R. R. Snowden, Chemist and Soil Engineer, Los Angeles.

REFERRING to my article in the June 16th issue of the "Cultivator" on the yellowing of the leaves of the lemon, the conclusions then expressed have since been verified, particularly with regard to the orange.

A number of analyses of soils made since and prior to that time have been carefully collated with reference to their magnesia-lime contents and the condition of the respective orchards from which such soils were taken.

Loew has said: "The proportion of these two constituents in soils (magnesia and lime) is a more potent factor in the resulting crop than is generally supposed." Certainly an examination of the table below should leave little doubt that excess of magnesia beyond a certain proportion of lime in the soil is responsible for many—though not all—cases of malnutrition in citrus trees in Southern California at least, if not elsewhere.

In general there are two methods of reaching a conclusion, namely: the deductive, and the experimental. And a deduced conclusion may be as reliable as an experimental one. For instance, suppose there are in the mountains a number of large springs differing widely in their dissolved mineral contents, the outflow from some one of which runs by us. Should the analysis of the water of this stream coincide exactly with that of a certain one of these springs we may as legitimately conclude that this stream takes its rise in that particular spring as though we secured experimental proof by tracing the stream to its source.

Although I have not yet transformed a chlorotic, unthrifty orchard into a green and thrifty one, by the means I shall suggest, yet I will present deductive proof that it can be done.

In all this work account is taken only of the available lime and magnesia in the soil, since we are not now concerned with the possible stores of material locked up in practically insoluble forms to become available through the operation of geologic processes within the next thousand or so of years; and which are providentially preserved against the rapacity of the present for the use of generations unborn. It is readily seen that analyses showing the total lime and magnesia content of the soil would be entirely valueless for our present purposes, since they would utterly fail to furnish the practical information so manifest in the table.

With a few apparent but easily explained exceptions, it is seen that just so soon as the lime content drops below 2 to 1 of magnesia there is serious trouble in the citrus orchard.

X-1.

Nos. 326 and 339 although containing 2.53 and 2.07 parts of lime respectively to one part of magnesia, are found in the sickly class when apparently they should be in the thrifty. This is due to the fact that both these are heavy clay soils and the lime in each is below the minimum of adequacy regardless of magnesia. Besides this, No. 339 is very high in total soluble salts. When the rule laid down seems to fail other operative causes may be looked for.

X-2.

No. 247 is seen to be still thrifty although below the provisional "deadline." This is the subsoil of number 246 with its 2.42 parts of lime, which may assist the subsoil. And besides this, the large actual amount of lime, —1.47 per cent—may be sufficient to set aside the rule holding good with smaller percentages.

X-3.

In Nos. 296-7 where the lime has dropped down to 0.67 part to 1 of magnesia the trees might be expected to be badly affected instead of "getting mottled"; but this apparent discrepancy has served to throw further light on the subject in that it shows that the thorough cultivation and generous fertilization with superphosphate and nitrate of soda received by this orchard have visibly restrained the injurious action of the excess of magnesia. This orchard has vacillated between incipient chlorosis (mottled leaf) and a condition of comparative greenness as the different applications of fertilizers were partially exhausted and then renewed. The same experience of delaying the evil day by thorough culture and generous applications of these same fertilizers has been exemplified in the case of Nos. 311-3, although owing doubtless to the high actual magnesia content in this soil the fight has not proved so successful as in the other case.

In this case the trees (orange) have received in the 22 months up to May 3rd, 23½ pounds of superphosphate, 11 pounds nitrate of soda and 21 1-5 pounds of other fertilizer per tree, and two legume cover crops. In this time they yielded per acre, in the season of 1908-9, 350 boxes, and the last, 240 boxes. "The leaves are small and brittle, and the trees bloom over-profusely and consequently drop over-heavily. The hot spell of May 3rd again made the bloom and leaves drop."

Where the lime and magnesia are both low, the excess of magnesia is manifestly more easily controlled, as seen in the case of Nos. 296-7. But when so controlled by the even generous use of the ordinary fertilizing materials the margin of safety is so

Lab. number.	Found		Proportions.		Condition of the trees.

Mr. Orchardist

I do not advise a complete analysis of your soil. This is the work that is responsible for the doubt now cast on the value of soil analysis. I will determine the

Chlorine, Alkali,
Total Soluble Salts,
Phosphoric Acid,
Potash, Lime, Magnesia,
Adequacy or Inadequacy
of Humas and Nitrates;

and these determinations will have reference to the materials now subject to the use of the plants. I will also give a mechanical analysis of the soil. This is all that is necessary to know for practical purposes and is much cheaper than a complete analysis. If the orchardists realized the profitableness of this information to them, everyone would want this work done at once.

small that the trees might be expected to experience the vacillating tendency mentioned above.

Nos. 372 and 373 are different parts of the same orchard, with 374 an adjoining one. In No. 372, where lime is but 1.90 to 1 the trees are affected, while in No. 373 where it is 2.05 the trees are apparently healthy. In No. 374 with its 2.46 parts of lime the trees are reported as having phenomenal growth, and fine looking.'

The Cure.

I have made some experiments to determine the comparative extent of the deterrent action of magnesium carbonate on the solubility of calcium carbonate and sulphate. Here are the results:

(a) One gram each of magnesium carbonate and calcium carbonate were shaken thoroughly with water and carbon dioxide.

(b) One gram each of magnesium carbonate and calcium sulphate were treated exactly the same as in (a).

(c) One gram of calcium sulphate was also subjected to the same treatment. In all cases the water was 50 cubic centimeters, and the carbon dioxide was about the same in each.

Results: In (a) 23 per cent (barring fractions) of the magnesia was dissolved along with but the merest trace of lime.

In (b) 18 per cent of the magnesia was dissolved along with 7 per cent of the lime. In (c) 10.36 per cent of the lime was dissolved, which represents the limit of solubility of calcium sulphate. The normal solubility of calcium carbonate is about in proportion to the free carbonic acid present.

It is thus seen that in the case of 100 parts of magnesia to 117½ parts of lime, both being carbonate, the lime was practically insoluble; while with only 86½ parts of lime as sulphate the magnesia restrained the solubility of the lime to the extent only of 3-10 of its full solubility.

The superior value of calcium sulphate for counteracting the injurious action of an excess of magnesia in the soil seems to be indicated by the above results. This also seems to explain the beneficial effects of the fertilizers named above, which were probably largely due to the gypsum present as a part of the superphosphate used.

Where there is good drainage and an abundance of water it would seem that the magnesia could be washed out without loss of much of the lime. but it must be remembered that calcium chloride is removed by leaching about twice as fast as magnesium chloride. Hence the combinations must be previously determined.

Where the injurious proportions of lime and magnesia prevail and the actual amounts are high, the cure by additions of a suitable lime salt becomes a serious matter. For instance, in the case of Nos. 311-3 it will require 207 tons of gypsum if 100 per cent pure to supply sufficient lime to a depth of four feet in one acre to bring the lime up to simply double the magnesia.

Although there is probably much yet to learn in this matter, and that other conditions may be found to modify or aggravate this injurious action, the writer feels justified at this time in drawing the following:

Conclusions.

1. In sand and loam soils in Southern California citrus trees demand at least twice as much lime as magnesia for their continued prosperity.

2. Thorough culture and generous fertilization may postpone the evil day, but cannot avert it without adequately supplying lime in a suitable form.

3. The sulphate appears to be the best form of lime to meet this trouble.

4. Many citrus orchards in California are probably near the borderline of safety, and unles the lime content is maintained in due excess of magnesia there will be just so many gradual failures in productiveness and general thrift, among them.

5. Where the actual quantities of lime and magnesia are small, the constant use of gypsum as a constituent of superphosphate has so far prevented such decline in these orchards.

6. This injurious action, like every other condition that reduces the vitality of the tree renders it less resistant to the attacks of insects and other enemies.

7. A very wet season should be followed by a period of greater freedom from the troubles arising from this condition, owing to the necessary removal, by leaching, to a greater or less extent, of the injurious excess of magnesia. Conversely, a very dry season should mark a greater prevalence of the trouble.

FLORIDA OUTLOOK FAIR.

During the past few days we have made inquiry concerning the citrus crops in this county and we are pleased to state that the outlook is flattering at this time. True the orange crop is not as good as it was last season, but grapefruit will be the crop that will bring in the returns. It is estimated that there will be a splendid crop of the latter.—Fort Myers, Florida, Press.

Like the rest of the counties in the orange belt, Volusia will not market over a half or two-thirds of a crop the coming season.—Volusia Record.

There is considerable bloom coming out on the groves around here, and the growers are wondering if the season of 1907-8 is to be repeated, when there was quite a heavy crop of fruit harvested from the June bloom.—Volusia Record.

There is quite a good deal of bloom in the groves at present, a thing usually not considered desirable. But one shipment of twenty boxes of late bloom grapefruit this year sold in New York for $95.00. If all late fruit could sell as well no one would grumble.—Florida Star.

The fruit crop is light owing to dry weather.—DeSoto News.

WHERE CLOVES COME FROM.

The principal source of the world's clove supply is Zanzibar and the neighboring island of Pemba, East Africa. A 10-year old plantation should produce twenty pounds of cloves to the tree. Trees of twenty years frequently produce upward of 100 pounds each. Besides the buds the stems are gathered and form an article of commerce, commanding one-fifth the price of cloves and having about the same percentage of strength. To this is due the fact that ground cloves can be bought at a lower price than the whole cloves.

Deciduous Fruit Culture

FINER FRUIT.

I HAVE found the recent numbers of the Cultivator exceptionally instructive and interesting; especially did I derive benefit from the one on frost protection, also from articles on orchard fertilization. Along this latter line there are of course many problems still facing farmers which, as a general rule, they are trying to dodge. This results in the dollars dodging us.

What is now uppermost in my mind is;—How may I grow bigger and finer peaches? In the issue of July 28th Mr. Thorpe states very correctly that California soil is very uneven, that is, on the smallest place there may be both good and indifferent soil. This must be taken into account in the application of fertilizers. While my experience in California is less than five years, I have realized the truth of this statement for sometime, but the question is still before me how to grow better peaches.

The only way open to me seems to be to turn my twenty-acre peach orchard into an experimental farm. That will cost money, especially as some of these experiments are bound to prove a losing venture. Mr. Thorpe's formula may answer on my place; it may not: he has oranges, I have peaches. I know that my soil is short on humus, and we are raising all that is possible every winter, and if Mr. Gardiner will put his on top of mine I will thank him most sincerely. (Mr. Gardiner in an article entitled, A Hint and a Complaint, in the Cultivator of July 28th, referred 'to his trouble in plowing under green manure crop). Stable manure is not to be had in sufficient quantity, so that besides the green manure crop there is nothing to be had but the commercial fertilizers. Now I will state my case, and perhaps the Cultivator may give a hint in the right direction.

My soil is sandy loam and full of iron, packs very hard after irrigation yet will pulverize readily and leaves few lumps after cultivation. It is 20 feet to water. There are spots of ashy soil in places around me but none among these trees. I irrigate three times during the season, running small streams in furrows, 20 streams for six hours or more. It floods but little. This I find a very satisfactory way to irrigate—I learned this also from the Cultivator.

These trees are now in their fifth year and most of them have full crop this year as to number, but size is too small; even the trees which have a small quantity of fruit fail to size up. The soil is apparently rich enough to grow good trees, as they are bigger and thriftier in appearance than similar trees in other soil, but it is equally as evident that the stuff to make large fruit is lacking or, as I am inclined to believe, locked up in the soil. At least my alfalfa gives a double crop on the section where I have applied gypsum. I have used phosphates on three rows of the trees but it accomplished nothing.—Axel Kap, Kerman.

* * *

Mr. Kap is facing the same difficulty which all agriculturists face; the range of knowledge required of a good farmer is great and he must apply all he has and in addition observe intelligently the experiments he contemplates. One question seems to us worthy of consideration in view of the fact that these trees are growing thriftily and better than some others, and that is;—Are the trees of a variety and a strain that will produce the larger and more desirable fruit? We assume that on this point the inquirer is satisfied, but trees of a good variety sometimes persist in failing to give as large fruit as trees of the same variety on a neighboring ranch or possibly on the same ranch. However, as all the trees in the orchard seem to grow the smaller fruit, the experiments with fertilizers may lead to the solution of the problem. We believe the determination to continue to put humus into the soil is very wise. It will help to retain the moisture which is a most valuable factor. By the way, are the three irrigations per season sufficient? With water 20 feet from the surface they should be, but with the experiments contemplated we would try another with more frequent irrigation. We would also try one plot with a liberal application of some form of potash. The gypsum experiment would seem to indicate that the potash of the soil is locked up.

Can any of our subscribers lend a helping hand in this discussion.

On Main Canal, Tulare Irrigation District, Part of the Immense Irrigation System of Tulare County.

COLORADO FROST PREVENTION WORK.

WHEN on May 5th the orchardists of the Grand Valley removed their smudge pots from between the trees and declared all further danger from frost past, the manufacturers as well as the ranchers breathed a deep sigh of relief.

The system of orchard heating, experimented with now for three years, had pased successfully through the most difficult ordeal in the brief history of its use, and the future of the fruit industry in the Grand Valley was assured for all time to come. Not only that, but a plan had been successfully devised whereby every crop of sufficient value to pay the cost, could be insured not only against frost, but against a downright freeze as well. Never again will the press dispatches announce a loss of seventy-five million dollars in crops in a single night. The compaign in the Grand Valley this year, hard as it may have been, has amply demonstrated this economic fact.

Here and there you will find a doubting critic who not only derides the use of the orchard heater, but who declares emphatically that this particular section of the country is immune from frosts.

Similar claims were made in the Grand Valley. It was because of the fear of the orange growers of California that the outside public might learn of a possibility of damage from frost, that they refused to experiment with smudge pots. That same mistaken idea prevailed in the Grand Valley for many years. Here it was claimed was the Garden of Eden, where conditions were always ideal, where the frost bugaboo was never feared. But all the same, the serpent was there. The truth of the matter is that, although for an uninterrupted period of a dozen years but little trouble was experienced from frost—although now and then it was admitted that frost had damaged some particular section—when frost damage was unusually severe, the optimistic ranchers insisted that the heavy crop of the year before was responsible for the light crop, but never the frost.

And it may be stated without fear of contradiction that similar conditions prevail in every fruit section of the United States. This year demonstrated that not even California or Florida is safe from frost. The Grand Valley ranchers had the foresight to realize this condition first, and now from the flood of queries coming in, by next year there will be no more claims put forth that frost is unknown in this and that section.

In the Grand Valley there are rarely more than one or two nights in which the fruit buds are in danger from frost, and generally no heating at all is necessary. But the cost of this insurance protection for years to come will be more than repaid by the increased prices which will be obtained for fruit, due to the fact that other fruit countries failed to follow the example of Mesa county.

The results of orchard heating a year ago in the valley were such that the orchardists of the country might possibly be excused for not preparing to heat their orchards, as the experiments were not entirely successful. In fact, after the frosts of last year there were many orchards in the Grand Valley which had been heated, but produced no more fruit than those left unprotected. Consequently many of the ranchers were skeptical. I talked with many men who insisted that they had kept care-

See Announcement on Page 139

ful count of expense and results, and were positive that the excess fruit on the heated sections of the orchard would not pay the expense of the heating. Last year the mercury fell to 22 above zero in sections of the valley, and then for only a few minutes.

Aside from the practical demonstration of the success of heating, even with the temperature 15 degrees below freezing for a long continued period, the experience of 1910 will teach a number of important lessons for the future success of the fruit industry of the nation.

Most important is the lesson that orchard heating is a man's work and not child's play. The game cannot be played in a haphazard fashion. To win the fight with frost, the rancher must be always on the ground watching his thermometers in and out of his orchard and ready at all times to give battle to Jack Frost with added coal and oil.

Some of the ranchers who heated their orchards this season lost their crop. But it will be found, as a general thing, that they did so because of some defect in themselves, not in the principle of orchard heating. Many of them had insufficiently equipped their orchards with heaters. They had failed to follow the advice of the experts, who, from previous experience, had recommended a certain number of pots to the acre. Others lacked fuel, and still others lacked help. Insufficient equipment was responsible for the greatest losses. This was coupled with lack of system. Some of the ranchers started the pots going and then retired. They had no crops when they were awakened in the morning, even though the pots were still burning. Failure to systematize the work left many of the pots unlighted. The rancher and his assistants failed to find them in the dense smoke pouring from the heaters which had been lighted.

One of the largest growers, W. B. Cross, who has a 240-acre orchard, a large part of it in bearing, is planning to organize a fire-starting department, on the same principle that cities now use in extinguishing fires. Mr. Cross plans to get a crew of twelve men and organize them long before the danger season opens. They will be given regular drills, each man will have been assigned a part —lighting, refilling, or watching the thermometers, and when the alarm is sounded each man will know his particular duty. Mr. Cross is a user of oil pots. For the ranchers who heat with coal, system is even more important. Refilling of coal pots is a laborious task and requires time, and unless the rancher is prepared to do this with sufficient help, he will find himself with smouldering fires at the most critical period of the night.

There is still much difference of opinion as to whether the coal or oil heaters are best for orchard protection. It is undoubtedly true that both proved successful and saved a large per cent of crops when the mercury fell 15 degrees below freezing. But you will find oil advocates who insist that the coal men did not save their crops, and you will also find advocates of coal who declare that the oil-burners cooked the blossoms on their trees. These are questions still open for discussion. The vital principle in which the orchardists are interested is whether the heating will save a crop, and the truth of this has been amply demonstrated. In the freeze of April 16th, the blossoms were in their most delicate stage, and the test of the orchard-heating theory could not possibily have been more severe.

Many of the ranchers permitted the mercury to get too low before they lighted their fires, or else were not provided with accurate thermometers, both in and outside the orchards. Thus, when the mercury began dropping outside the orchard, they had no means of knowing the exact conditions and lighted only an insufficient number of pots. It was also proven that it is exceedingly difficult to increase the temperature quickly and to any great degree, when it is growing steadily colder. It is claimed for many of the heaters that they will raise the temperature 10 to 15 degrees. This is undoubtedly true. But when it is freezing and the mercury is on a downward slide, the man who waits too long cannot expect to save his crop. The orchardist will find it much less difficult to maintain a safe temperature among his trees than to force up the mercury by artificial heating when every minute is thinning out the buds and blossoms. Thirty degrees is generally considered to be the stage at which the cold begins to nip the buds, and it is well to start the pots going when the mercury touches that figure. Some growers did not wait that long, but lighted up when 32 degrees was reached.

Where the weather bureau co-operates with the citizens, as was done in the Grand Valley, and as will be done in any section of the country upon request to the government, the fruit growers have plenty of advance notice to know what to expect during the course of a night. While predictions of frost are sometimes made which fail to materialize, the wise rancher will be prepared for danger upon receipt of the warning. One thing is certain: The forecaster has never misled the farmers by telling them there was no danger of frost, causing them to be frozen out because of it.

The success attained in the Grand Valley this year by the use of orchard heaters has caused an unprecedented demand for heaters all over the United States due, no doubt, to the general losses by frost over the country. The heaters had been pretty well scattered this season through different states by manufacturers, and success was reported in every instance. The principle of orchard heating can also be applied to low-growing crops, such as strawberries, grapes, etc., the only limit to the use of the pot is the matter of cost. In the orchards of the Grand Valley, where returns from the crops are from $200 an acre up, considered as insurance, the expense of frost protection is small. This year, for instance, the increased price which will be received for what fruit is produced will pay the cost of the insurance several times over.—Louis Meyer, in St. Jo. Fruit Grower.

LIME IN BORDEAUX.

Air-slaked lime cannot be used for the Bordeaux mixture, especially if it has been long air-slaked. Get fresh lime and slake it and keep it under water. When you want to use it, take three times as much of the lime paste as you would of dry quick lime. You can use hydrated lime all right for making Bordeaux.

By self-boiled lime-sulphur wash we mean a preparation that is boiled only by the heat from the slaking of the lime. It is best to put eight pounds of quick lime and eight pounds of sulphur together in a barrel with about enough water to cover it. We do not recommend it in place of the Bordeaux, as it has not yet been proven that it will be any better, nor even as good. Further experiments will give us the answer in this direction.

There will be no harm in using more than four pounds of lime in the Bordeaux mixture, although it is not necessary to use more than four or five pounds of good fresh lime for each three pounds of bluestone. The only objection to using more lime would be, that it stains the foliage or plants that are to be kept for ornamental purposes, as, for example, shrubbery in the dooryard, and it also stains fruits if put on near their time of ripening.—Coleman's Rural.

Are you befogged?
You can't get befogged about roofing when you steer straight for Genasco, and get it for every building on the farm.

Genasco
Ready Roofing
is made of the only perfect waterproofer—Trinidad Lake Asphalt, Nature's own product. No mystery; no guess-work. Genasco has the life that lasts. Proven by over thirty years' use of natural asphalt.

The Kant-leak Kleet is the [illegible] in applying roofing. [illegible] without cement. [illegible]. Enhances beauty of the roof. Supplied with Genasco rolls, when ordered.

The New Idea

Just the thing that every farmer and orchardist has been looking for for years — a real Manure **Spreader** — not simply an unloader. That is why the

New Idea
Spreader

takes the lead.

Why?

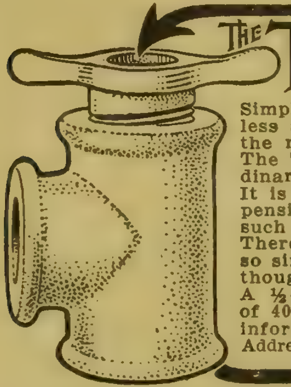
Because—

It will absolutely pulverize hard substances better. Gives wider and evener spreading of any class of fertilizer. Less weight. Lighter draft. Absolutely gearless, no cogs or bevel gears. Its simplicity insures less breakage. Low down and easy to load. Only perfect endless conveyor that cannot race or slip, and needs no cranking back for re-loading. Better construction and longer life. Strongest wheels, both front and rear tracking with standard wagons. Load evenly carried on both axles. Double cylinders with Pointed Teeth, preventing choking and bunching, and the Widest Range of Feed.

By removing two bolts and taking off bed you have the best farm truck on earth.

Illustrated and descriptive catalog on request. Demonstrations to responsible parties.

Western Implement Co., Sole Agents
131-133 North Los Angeles St. Los Angeles, Cal.



The Tee Irrigating Valve

Simple in design and construction, costs less and will last longer than any other on the market.

The Tee Irrigating Valve is made of an ordinary malleable Iron T with a brass plug. It is designed for those who want an inexpensive irrigating valve, especially where such valves are needed in large quantities. There is nothing to get out of order. It is so simple you will wonder why it was never thought of before.

A ½-inch valve sent post paid upon receipt of 40 cents. Quantity price, circular and full information upon request.

Address **George C. Roeding, Fresno, California**

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

SORGHUM POISONING.

As there have been frequent inquiries as to effect of feeding sorghum to stock, especially as to chances of poisoning, we make a number of quotations from authorities on the subject. We have never heard of a case of poisoning from this cause in California, but as the question continually comes up, it is worth touching upon. Any of our subscribers who have definite information as to serious results from sorghum feeding will benefit many interested readers by describing the trouble and results. There seems to be no doubt but that ill effects and even death have occurred from this cause, especially in sections subject to early frost. The same results have been reported from the feeding of corn stalks of which thousands of tons are fed in this country every year, but not so often as from feeding of sorghum. The first quotation we make is from "Feeds and Feeding" by W. A. Henry of Wisconsin.

Dangers from Second-Growth Sorghum

The agricultural press reports cattle dying suddenly after eating very small quantities of second-growth sorghum. Coburn quotes Pritchard, the Kansas state veterinarian, as saying: "Second-growth sorghum under certain conditions is very destructive to cattle, small quantities killing them almost instantly. Just what this destructive agent is I am unable to say." In the same report reference is made to Kaffir corn causing the same trouble. Tracy reports that the second-growth "chicken corn," a variety of sorghum found in the Gulf states, when eaten by cattle, sometimes produces fatal results within a few minutes. He says: "It seems to affect only certain animals, or perhaps only certain plants produce the ill effects, as generally only a few animals in a herd are killed, and these are commonly found near together." No one knows why second-growth sorghum should cause trouble in the way noted, and no remedy is known. Prevention is the only means at hand.—Feeds and Feeding, Henry.

From Bailey's Cyclopedia of Agriculture.

Sorghum, and particularly second-growth sorghum, may contain, under conditions that are not entirely understood, sufficient prussic acid to kill cattle quickly when they pasture on it. The animals usually die so quickly that little can be done. If possible, give as a drench, sixty to eighty grains of permanganate of potash dissolved in a quart of water.

Care must be exercised in feeding the young growth, as it has been found that prussic acid develops when the growth is checked. Under certain conditions, young growths of all sorghums may be poisonous. Frost and extreme drougth are supposed to develop the poison by checking the growth, resulting in the action of an enzyme on a glucoside normally present in the plant.

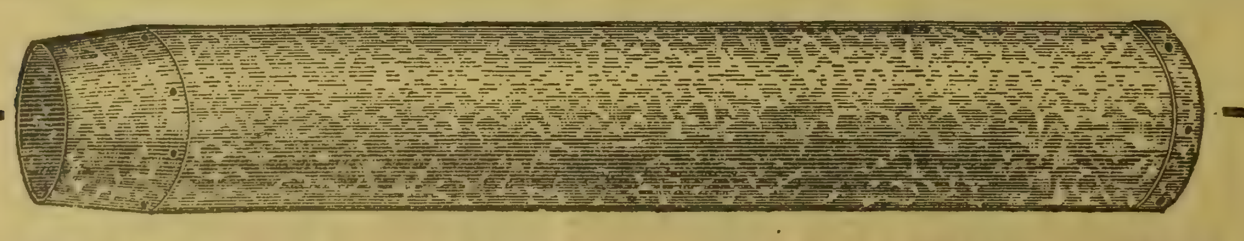
* * *

Sorghum makes excellent pasture for hogs, but in many sections it must be pastured sparingly, if at all, by sheep and cattle. After periods of extreme drouth, or when growth is stunted from other causes, the leaves of the sorghums often contain a large amount of prussic acid. A small quantity of this poison is fatal to stock, and death frequently results soon after the sorghum is eaten. Normal growth seldom contains prussic acid in appreciable quantities, and it largely disappears in curing, so that cured sorghum may be fed with little danger. There is also some danger from bloating; cattle and sheep should not be turned on sorghum pasture when hungry or when the plants are wet. With the exercise of care, however, the crop can usually be pastured with safety. It should be at least two feet high before stock are turned on it; for cattle, sheep and horses it may be much more mature than for hogs.—Bailey.

EDUCATIONAL BUTTER SCORING CONTEST.

In spite of the fact that this is perhaps the most discouraging part of the year for buttermakers, twenty-one entries were sent in. It is encouraging to note the interest which is being taken in the work, for letters from some of the contestants indicate that they knew conditions were greatly against them. In most cases, the low scores cannot be charged entirely to the buttermakers, as it appears from the method blanks that they have used greatest care in the manufacturing process. The large number of entries showing the effect of the season,—overripe, and poorly cared for cream—makes the importance of receiving good cream very evident, and all buttermakers will do well to strive along this line. There is nothing more discouraging than to have to work with old stale cream, as the high acidity when received, makes any control of the ripening process impossible, and, the use of starter cannot overcome the undesirable flavor which is bound to be present in the butter. So, upon the farmers must be urged the necessity of better care of cream, for the standard of California butter can never be raised until this condition is overcome.

The scores placed were as follows:



AMERICAN SURFACE IRRIGATION PIPE

SAVES WATER, GRADING AND TIME

The only scientifically constructed ***Surface Irrigation Pipe*** on the market. No round seams to leak, retard the flow of the water, or weaken the pipe. Cheaper than flumes. Easily handled. ***Will last a lifetime. The correct way to irrigate alfalfa.*** We make Riveted Water Pipe and Tanks. ***Write for illustrated catalogue.***

Bay View Creamery, Napa	91
Woodland Creamery, Woodland	91
Turlock Creamery, Turlock	90¼

Others competing ran as low as 87 per cent.

The butter receiving the highest score was made from grade cream, one day old. After 10 per cent starter was added, it was held at 58 degrees for three hours. One hour before churning, it was cooled to 50 degrees, the churning temperature. The time of churning was 45 minutes, and there was one washing, at the same temperature as the buttermilk, 54 degrees. The result was butter of a fine clean flavor, and having good body and texture.

In comparison with the last entry, there were very few pieces containing mottles. It is pleasing to note this improvement, as at least 40 per cent of the third entry showed mottles or streaks. Mottles are mechanical defects and can be prevented by proper washing and working.—Leon M. Davis.

DAIRY INSTRUCTION.

The Department of Dairy Industry of the University Farm at Davis informs us that the short courses in dairying will begin at Davis, October 3rd and will continue until November 22nd. Effort has been made to present a course which will surpass in quality and thoroughness any so far given. These short courses have been very popular with the creamerymen and dairymen who have not been able to absent themselves from their activities. It gives them an opportunity at least once a year to mix with others of their profession and at comparatively small cost get most practical dairy and creamery instruction. There are two short courses to be given; one on Dairy Manufactures beginning on October 3rd and extending to November 22nd, and another on Market Milk and Cream Supply beginning October 17th and extending only to the 29th. Regarding the Dairy Manufactures course Mr. Hopper writes:

"This course for butter and cheese makers deals with the nature and qualities of milk or cream and the actual making of butter and cheese. It includes the secretion, composition and handling of milk; fermentations in milk and their control; testing, running separators, ripening, starters, pasteurization, churning, moisture control, dairy bacteriology, steam engines, boilers, motors, pumps, etc. In addition to the above, cheese-making includes the treatment of the milk and all the steps taken in making both cheddar and California cheese, together with curing, storing, etc. Important features of the course are the creamery accounting and lectures upon the breeding, care and improvement of dairy herds and practice in judging.

"The school is equipped with a full line of modern machinery and apparatus to properly execute all phases of the work."

The Market Milk and Cream Supply Course is designed for creamery patrons, dairymen, dealers, etc., covers in two weeks the essentials in methods of producing and handling milk or cream for creamery purposes, or for direct consumption. There will be lectures on the breeding, care, and improvement of dairy cattle, testing milk and cream for butter-fat, acidity, adulteration, etc. There will be practice with hand separators; also bottling, standardizing, pasteurizing, etc.

Dining Hall, University Farm, Davis.

The cost of the Manufactures Course is $10.00 to $15.00; for the Milk and Cream Supply Course, $2.00: books not to exceed $5.00. Board and rooms may be had on the Farm.

DOES SHE PAY?

Dairyman! Are you sure that each cow in your herd pays you a profit? If you do not know this, by actually weighing each animal's product through at least one lactation period and keeping careful records of her feed, Bulletin No. 322 of the Station at Geneva, N. Y., has a lesson for you.

Class in Cheese Making at Work.

In the good herd of the Station, the result of careful breeding and selection for years, great differences were found between individual cows. The best cow of the herd, who held her place for four years, gave three times as much milk as the poorest cow in each of three seasons; and it cost only one-tenth more to feed the good cow than to feed each poor one. Similar, or worse, conditions exist in many herds in the state. Even the poorest cow in this herd probably paid for her feed; for she produced butter fat at from 25 to 33 cents a pound; but the Station has records of herds in the state that average only 80 pounds of butter fat per cow, bringing in a gross return of $26 a head. How much it cost to feed those herds probably no one knows, but the least the Station could carry any cow through a year on, for feed alone, was $47.50. If these poor herds gave an average of only $26 worth of product in a year, $20 less than it cost the Station to keep its lightest-cost cow, how much did the poor cows of those herds lose their owners? Any cow-keeper will be interested in this bulletin, for it gives very accurate data for production and food cost of that production, of 19 cows yearly for three years.

The Station herd consists of Jerseys and Jersey grades, and has been built up at small cost, just as any farmer could build up his own herd, until it averages more than 6000 pounds yearly per cow, of 5½ per cent milk.

SELECTING THE BOAR.

Whenever possible the breeder ought to inspect personally the animal he selects as a herd boar, but when unable to do this and he has no competent representative, he should endeavor to make the best selection possible by mail by detailing his needs, and the deficiencies of his sows. Ordering by mail should be considered a last resort, to be done only when the purchaser cannot buy near home, or for other good reasons is unable to give his personal attention to the selection. When that is the case the purchase should be made from a breeder known to be reputable and the needs of the buyer and the price he figures on paying should be definitely stated in the letter as the attitude of one who expects the best possible for his outlay. All men who have had much to do with the selling of pure-bred boars are familiar with the buyer who insists that "you must get him down as low as you can —he must be cheap, as I have written to a number of other breeders." A man of this stamp is likely to want a boar of almost impossible make-up for a very small sum. He is less likely to do well in his purchase than the man who will frankly state the type of boar he needs and the amount of money he can afford or intends to invest. The chances are, too, that the latter procedure will bring much the better treatment.—From Coburn's Swine in America.

No Hoof, No Horse

U. S. statistics show that 80 per cent of all horses are lame and that 80 per cent of the lameness is caused by hard and contracted feet. As a hoof softener, toughener, nourisher and grower there is nothing equal to

Eshelman's Wool Fat Hoof Healer

A horse's hoof is from 60 to 70 per cent water. Grease and water will not mix. There is no grease about Wool Fat. It mixes readily with water, is very penetrating, and while a great medicine of itself, it also acts as a vehicle to carry to the afflicted parts the other medicinal properties of the HEALER. It is absorbed into the skin and gives natural stimulation and nourishment to the hoof. There is nothing that can compare with it for this purpose, nor as a remedy for contracted hoofs, split hoofs, quarter cracks, mud fever, corns, grease heels, and for all kinds of sores and cuts anywhere on any stock. If you have tried it, you know that this is true. If you have never tried it, it will surprise you with its power as a healer and restorer. It is not a new remedy, but has been on the market in the East for many years, where it has given the greatest satisfaction.

4 oz. package, 25c; 12 oz., 50c; 32 oz., $1.00; 5 lb. pail, $2.00; 10 lb. pail, $3.50. It is easy of application. Directions with each package.

TRIAL OFFER.

We will send you a 2-lb. can, use it 15 days, and if satisfactory, send us $1.00. If not, write us to that effect, and you need pay nothing. We take all the risk, you just try it. Send for it today.

The Ornamental Garden

THE OLD GARDEN.

I know of a haunted garden where the old-time flowers grow;
There are hollyhocks and lilies in a long and stately row;
There are lilac trees by the gateway, and roses white and red,
And the southern wood's spicy fragrance follows the careless tread,
A memory-haunted garden, out of life's busy way,
Where the smell of vanished summers lingers the livelong day.

The hands that planted these flowers have mouldered back to dust.
But their hearts are true and steadfast and they seem to hold in trust
The memories of the old-time, and those whom men forget;
Perhaps for the lilac and the lily the dead are living yet.
Those whom our eyes can see not may tend them still—who knows
Of the strange sweet secrets hidden in the red heart of the rose?

Does grandmother come to gather its pinks and pansies still
From the grave which kind hands made her in the churchyard on the hill?
Does she know when the lilacs blossom that she planted long ago?
The question must go unanswered, but I fancy it may be so:
And so from the dear old garden not a flower I take away,
But leave them all to be gathered by the hands that are dust today.

—The National Magazine.

LAYERING.

LAYERING is the multiplication of plants from the decumbent shoots and runners that naturally come in contact with the soil, taking root at the nodes or joints, or from upright branches that are bent down to the ground and covered with the soil. Layering is one of the simplest and easiest methods of propagation, as the parent nurses the layer plants until they can sustain themselves. It is a reliable and ready means of reproducing many hard-wooded plants that do not readily strike root from cuttings. The black raspberry and dewberry are familiar examples of plants propagating from natural layers. The tips of the branches strike the ground first, and if the soil is loose and mellow, they take root readily. The parent branch is cut off some 4 to 6 inches above the ground and a separate plant known as a "root tip" is secured. The short portion of the old branch serves as a handle in carrying the plant. In most cases of layering the branches must be bent down and covered with soil. This covering may be continuous for a considerable distance along the stem, or only the joints may be covered. The covering should be shallow, not more than 2 to 5 inches deep. If more than one plant is secured from a shoot, they will usually lack in uniformity and vigor. Hard-wooded plants often do not strike readily from layers, and in order to induce their formation the branch is twisted, girdled, or split at the point where it is desired that roots shall form. In commercial propagation the parent plants are often cut back to the ground in order to secure many shoots fit for layering. In the gooseberry, quince, and paradise apple, the new shoots are not bent down to the ground, but the soil is heaped up around their base in the shape of a mound. These shoots send out roots near this base, producing straight, stocky plants, which may be set out into their permanent location after one year in the mound, or they may be taken off and grown another year in the nursery row.

The pot or aerial layering is confined almost entirely to the greenhouse, where moisture and heat can be kept uniform. The stem is usually split or girdled at the point where roots are desired, and surrounded by moss or soil to retain the moisture. The roots start from the injured parts, and when they fill the material placed around the stem, the branch is cut just below the layer and treated as a separate plant. The common house rubber-plant is largely propagated in this manner.—Ohio Ag. Bulletin.

TIME OF PRUNING ORNAMENTALS.

The time of pruning is so dependent upon the kind of pruning that it cannot be considered wholly by itself. The cutting away of dead wood and interfering branches may be done at any season, though without doubt the best time is late winter or early spring. Then the plant is without foliage and it is easy to see just what needs to be done. Soon growth will begin and the wounds start to heal. This, too, is the season in which to make such removals of the older wood as will tend to renew the plant and to assist it to maintain its form and prolong its life. The cutting back of rampant growths and straggling shoots should be done when the need is evident, regardless of season.

For the shortening in of the flowering wood there are two general seasons, dependent upon the character of the plants,—late winter or early spring and summer. Those shrubs whose flowers are borne on the ends or the sides of the shoots of the previous season, should not be cut back in winter, else there will be a total loss of bloom. Such shrubs should be cut in immediately after the flowering season is over. This will encourage the growth of new shoots from the buds near the base of the branch, and these will grow rapidly to take the place of the part that has been removed and cover themselves with flower buds for another year. Those which bloom in late summer or autumn from buds produced on shoots of the current season's growth, should be pruned in late winter or early spring, so as to encourage abundant summer growth and buds.—The St. Jo. Fruit Grower.

The Chinese sacred lily is a narcissus, and is similar in character to all other kinds, flowering but once from the same bulb The old bulb simply supports the young bulbs which it makes, and in a year or two when strong enough, these young bulbs flower, then they are done with blooming. As soon as a bulb has done flowering and the tops die back, the young bulblets should be taken off and set in good soil to grow on for a year or two, by which time they should be strong enough to flower.

Small Fruits and Vegetables

THE PRODUCTION OF VEGETABLE SEEDS.

THERE is profit in raising high grade seed. Seed crops of sweet corn, garden peas, and beans of good quality are in ever-increasing demand, and the quantity needed yearly has become so large that the seedman is obliged to have the major portion of his stock grown for him by others. Within the past few years there has been an enormous increase in the quantity of seeds produced for commercial purposes. This has been due in large measure to the development of seed growing and handling as a business. There are now nearly one thousand seed firms doing business in the United States. One of the largest of these uses buildings with an aggregate floor space of more than 16 acres. This space is much larger than was occupied by the entire seed trade of the country only fifty years ago. The quality also has vastly improved. One of the most encouraging developments in the growing of garden vegetables is the increasing recognition of the practical importance of using pure and uniform stocks of seed whose varietal characteristics adapt them to distinct local conditions and market requirements. Another consideration is the fact that the growing of seed crops of these vegetables can be undertaken without any radical change in farm practice or material increase in farm equipment. These conditions make this industry well worth the attention of farmers who are located where soil and climatic conditions are favorable for the best development of such seeds.

However, the raising of these vegetables for seed crops is not recommended for all circumstances, even when soil and climate are suitable. The farmer who contemplates undertaking seed crop farming, will do well to consider thoroughly the many elements which enter into profits. Seedsmen are often able to place contracts for growing seed at very low prices—even lower than that at which grain of the species can be sold on the market. Such a condition might be due to any of several causes, but usually rests on an over supply or a demand for an inferior product. The general tendency now however, is decidedly in the other direction, and both seed dealers and seed growers can do much by co-operation to further this tendency. The dealer should not buy by sample, no matter how good the samples may be, but should endeavor to limit his supply to seed which he knows was grown from pure and true stock seed, and, as far as possible, to that which was subject while growing to his own inspection. Knowledge, experience, and care, on the part of the grower will, also contribute much to a higher standard, and consequently to higher prices and better market conditions generally.

In response to a demand for greater knowledge of the cultural methods which are best adapted to seed crop growing for the vegetables mentioned, the U. S. Department of Agriculture has just issued a new publication, Bulletin 184 of the Bureau of Plant Industry, under the title "The Production of Vegetable Seeds: Sweet Corn, Garden Peas, and Beans." This publication discusses this whole subject very thoroughly and gives instructions for securing crops of seeds for these different species.

THE GLOBE ARTICHOKE.

The globe artichoke of the garden is a hardy perennial, and in a warm climate, an evergreen, growing from three to four feet high, with numerous branches. In rich soil the leaves will measure three to four feet in length, cut in deep, horizontal, convex segments, which are covered with an ash-colored down, the whole plant resembling a large thistle. The portion eaten is the under side of the head, before the flower opens. The whole head is removed and boiled, the leaves laid aside, the bottom eaten, dipped in butter with a little pepper and salt. It is sometimes eaten raw as a salad.

Sometimes the young suckers are tied together and blanched and served in the same manner as asparagus. Plants thrive best in deep, rich, loamy soil, although they occasionally grow in adobe soil of the very meanest gumbo type.

This plant is supposed to be a native of south of Europe. The first account of its civilization was in Italy in 1473, and from that period, when it was said to be very scarce, it has steadily grown in favor and its cultivation extended. There is a well defined impression among Eastern gardeners that a soil containing a large proportion of saline properties suits it best. Whether it would flourish in arid desert climate I do not know, but it has always been successfully grown near the sea.

In two or three years the plant may get too large and should be divided into two or four pieces to the hill. This should be done here any time from December to the last of January. Artichokes are not always satisfactory when grown from seed, owing to the numerous and undesirable types thus produced. One can secure a good stand by discarding the poor types and dividing the plants of the finer kinds and replacing the poor ones; but it takes time to do this. One ounce of artichoke seed will produce about 500 plants.—Rural World.

ANTHRACNOSE OF THE BLACKBERRY.

Anthracnose, a disease of the blackberry which has become well known among blackberry growers of the Northwest, is one of the numerous fungous diseases. The fungus attacks the leaves and stems of the blackberry early in the spring. Later, when the fruit forms, it is infested, and where the disease is abundant, considerable loss is caused, since the fruit dries up, becoming practically tasteless with little value as a food. It has been found that spraying twice with Bordeaux mixture before the fruit begins to ripen will reduce the disease enough to warrant spraying to control it. A spraying of single strength Bordeaux mixture gives splendid results. The exact time for spraying is not easily determined, but good results have been obtained where the first spraying was given about the time the plants bloom, and again when the fruit was grown to the size of garden peas.—Spokesman Review.

A Great Convenience.

Touring in the old home land, Mr. Edward Berwick writes the Cultivator from Edinburg, Scotland. He refers to one instance which may not be strictly agricultural, but indicates a condition which we hope will prevail in this country in the next few years to the great convenience and financial advantage of agriculturists. The incident has to do simply with Mr. Berwick's laundry. Not being delivered in time by the Liverpool laundryman it was sent from Liverpool to Bettws-y-Coed, Wales by English parcels post and cost fifteen cents. Mr. Berwick does not give its exact weight, but states that it was a large box.

Americans do not want this convenience, at least many of them have been influenced by the sophistries of the express companies to think they do not want it. Consequently they are not demanding it of Congress. On the other hand, the express companies are demanding and with the most extreme emphasis, that their business shall not be interfered with. For service such as Mr. Berwick paid fifteen cents, an American would be compelled to pay to the express companies several times that.

It is time this country waked up and demanded what every other country on the face of the civilized earth has. With the ever continued loss in the Post Office Department, it would seem that business intelligence would demand enlarging its scope so that it may become self supporting. Almost every other country has a self supporting Post Office department, and as noted, has a parcels post, but here the "interests" have such a hold upon legislation that it is impossible to secure these conveniences.

A Stitch in Time.

We have a letter from the veteran fruit grower at Riverside, Mr. J. H. Reed, in which he expresses appreciation of some of the good things in recent Cultivators. Particularly does he refer to Mrs. Sherman's work and to Dr. Thorpe's talk on fertilizers. Referring to that article, he says: "It has one feature which I think you may well encourage in other contributors; he tells definitely what he does himself, and how much. Such information from a known successful farmer sticks. General theoretical statements may be wise, but quickly evaporate."

Principally Mr. Reed writes of his interest in the number recently given over so largely to frost protection and suggests that agitation along this line should continue. Everything should be done in preparation for possible cold this season. "It is most discreditable to us that such tremendous wastage as occurred last winter should be allowed when means of avoiding it have been so definitely demonstrated." "Let the Cultivator arouse interest in even a few neighborhoods that will lead to timely co-operative preparation, and it will do a real and, in fact, a great service." Mr. Reed refers to the extensive work already being done by the Arlington Heights Fruit Co., stating that this great property has already "accumulated a very mountain of material for next winter's use." "Interests like those controlling the Arlington Heights properties seem to be quick to appreciate the necessity for advanced preparation. It is the five and ten acre grower who will not prepare and whose fruit will be a great factor in affecting prices next spring if it is injured by another cold season."

Preparation.

We note in an article on frost protection work in Colorado that fruit growers, and especially promoters handling lands adapted to fruit growing, protested for years against preparation for frost protection because of the fear of results if it were admitted that there was possibility of frost in that particular section. The article refers to a similar feeling in California and to the fact that this fear has caused the loss of millions to the fruit growing interests. We do not need to go to an Eastern paper for information that this is the case, but it furnishes additional proof of a statement made in a recent Cultivator along similar lines.

We are all exceptionally sensitive on the subject of our own community. This is most admirable and contrary to the spirit in some sections of the East. This feeling impels us to locate frost, disagreeable winds, and other undesirable features, just over the line in the next colony; our own community, of course, being perfect. This is proper enough perhaps for foreign consumption, but when a fruit grower has a valuable product on his trees which a little forethought in preparation will save, he should not hesitate to admit possible danger.

It is yet early to consider the frost question, but none too early to be fully prepared.

Be Informed.

Mr. J. W. McKay of Saticoy, writing to the Cultivator for information in the matter of planting and growing of apricot trees and particularly the curing of the fruit, suggests that the industry is of sufficient magnitude in this state to warrant much attention being given to it. Mr. McKay hopes for the getting together of apricot men. They should co-operate in the marketing of their fruit, and especially in securing information from each other as to output. He mentions an instance of a neighbor who through lack of information sold exceptionally nice fruit for a price far below market quotations at this time. This sale will help the dealer to hold down prices to the better informed grower who realizes the shortness of the crop and is demanding all he is entitled to. "I do hope in the near future that we growers may come closer together in a business way in selling our fruit. A dealer approaches me and offers me ten cents. He then goes to a man not so well posted and buys for less than nine. The trouble is the farmer is often too honest and takes it for granted that others will be honest with him."

What apricot growers need is an organization along the lines of the California Fruit Growers Exchange where a thoroughly competent business man devotes his entire time to posting himself on market conditions; while he is as honest as the most honest farmer he has information that prevents the unscrupulous buyer from pulling the wool over his eyes. When they can find the right man to do this work, then the orchardists should give their entire time to production, but until that can be done they must not only be producers but "middlemen" as well or they will receive unsatisfactory returns for their labors. It is to be hoped that the organization now formed in Orange county will result in success.

No Sulphur Decision.

Occasionally we receive an inquiry as to the situation in the Referee Board to which the Wiley decision on fruit sulphuring was referred, and we can only answer that the matter has not been formally decided. The board is made up of exceptionally careful investigators and the presumption is that in the preparation of their report they are waiting to be absolutely certain of their statements. There is little cause to fear that the decision will be adverse to the fruit interests. It is now thought it will be many months before the report will be given to the public.

Farmers Institutes.

The following dates have been made by J. B. Neff, conductor of farmers institutes for Southern California: Riverdale, Kern county, September 1 and 2; Delano, September 3; Wasco, September 5; Farmers Hall twelve miles southwest of Bakersfield, September 6. Mr. Neff has just returned from Kern county from arranging the details of these institutes, and local workers will now take up the work of preparing at the local end.

County Statistician.

We note the appointment of Mr. Geo. Robertson as county statistician of Fresno county. Mr. Robertson has a genius for figures and for many years has furnished not only interesting, but valuable statistics as to productions of the San Joaquin Valley. Such work does not show its full value on its face and does not always bring immediate returns. It is like the trial balance in business, of immense value in showing whether the industry is progressing or otherwise.

The Crop Reporting Board of the Bureau of Statistics reports on August 2nd that the condition of the cotton crop was 75.5 per cent of normal; compared with last year it is 5 per cent lower, though it has improved since the early June report. It is, however, 4 per cent below the average for the past ten years. It is encouraging to note that California tops the list, as the condition of its cotton is 98 per cent of normal while several of the Southern states report a condition as low as 69 and 70 per cent.

Agricultural News Notes of the Pacific Coast

Northern California

Oroville is calling for a creamery.

Biggs, Butte county, has a big prune crop.

An icing plant is being constructed at Portola, San Mateo county.

Some barley at Butte City, Glenn county, is running 25 sacks to the acre.

The cannery at Marysville began canning on peaches earlier than usual.

Thermalito, Butte county, is gathering its almond crop which will be immense.

The cannery at Santa Rosa, Sonoma county, is embarrassed from want of help.

Apple growers of Santa Rosa county are giving second spraying for codling moth.

Harvesting of beets for the Hamilton plant of the Sacramento Sugar Company, began last week.

One pear orchard at Red Bluff, Tehama county, will furnish this year about 30,000 boxes of fruit.

Two square miles of grain fields of Colusa county was burned last week near Sycamore. Loss was $50,000.

The state game farm near Haywards is sending pheasants and other game birds to various parts of the state.

Steps are being taken for the formation of an organization of deciduous fruit growers at Oroville, Butte county.

The canning plants of the California Fruit Canners Association at Yuba City and Chico will not operate this season.

A turkey raiser at Gridley, Butte county, has just transferred 600 turkeys several miles in order to secure better pasture.

The California Fruit Distributors have shipped over 3,000 cars, which is more than 300 in excess of last year at same date.

The Ehmann Olive Co. is enlarging and refitting its plant at Oroville, Butte county, and will have the largest establishment of the kind in the world.

Fig culture will be further encouraged in Butte county, one concern, the California Fig and Orchard Company, having purchased 2,000 acres to be devoted to fig culture.

The management of the Solano-Yolo Land and Water Company is securing signatures to contracts to supply water to the section between Vacaville and Elmira, Winters and Dixon.

Little Contra Costa county proposes to put some of the bigger counties of the state to shame by bonding the county for $1,400,000 for good roads. The plans call for 125 miles of roads.

President Taft has changed the boundary lines of Plumas and Tahoe Forests, adding 125,761 acres to Tahoe and transferring 19,485 acres from Tahoe to Plumas. The total acreage of Tahoe is now 1,279,815 while that of Plumas is 1,455,810.

Central California

Prunedale, Monterey county, is at its busiest because of hay baling.

A light grape crop is more than ever evident in the raisin sections.

The Turlock fruit growers association is shipping a car of fine peaches daily.

Contract has been let for another packing house at Sanger, Fresno county.

One car of melons shipped from Alta, Tulare county, averaged 31½ pounds.

There are twelve threshing machines now busy in the upper end of Salinas Valley.

The waters of the Kaweah river are a foot higher than formerly because of mountain rains.

Farmers in the Alta district, Tulare county, report excellent output of melons, also of potatoes.

The cantaloupe crop of Turlock, Stanislaus county, is not as large as last year, but quality is superior.

The Lindsay, Tulare county, Fruit Association has voted to add an $8,000 enlargement to its packing house.

The Tulare county board of trade has not only canned many exhibition fruits, but is now canning the flowers of century plants.

A stock grower of San Benito county, having a quantity of low-grade hay on hand, will feed to "stockers" and drive to market.

The entomological department at Berkeley is still receiving complaints of depredations of grasshoppers in various portions of the Valley.

The Fresno County Agricultural Fair management has determined upon a butter-fat contest in which $215.00 in premiums will be offered.

Engineers have submitted plans for weir in the Kings river to supply water to the People's Ditch Company which irrigates much Kings county land.

Hanford packing houses are busy erceiving dried peaches and apricots. The growers are generally demanding at least 4½ cents as minimum price for peaches.

The President has signed a proclamation eliminating 65,490 acres from the Sequoia National Forest, and has transferred 175,730 acres from the Sierra National Forest to the Sequoia.

An Irrigation District Association meeting was held in Turlock last week at which delegates were present from Turlock, Modesto, Alta, Oakdale, and South San Joaquin Irrigation Districts.

Horticultural Commissioner Rutherford of Stanislaus county has served notice on the Street Commissioner of Turlock to abate the nuisance of Russian thistle which is growing rampant in some streets.

Members of the fruit exchange at Lindsay have taken steps to withdraw from the Tulare County Fruit Exchange and inaugurate a new exchange of its own. This is not a withdrawal from affiliation with the California Fruit Growers Exchange.

Southern California

Several Valencia packing houses have closed for the season.

El Centro, Imperial county, complains bitterly because of the English sparrow.

Some enthusiastic orange growers estimate next season's output at 50,000 cars.

Mr. E. A. Palmer has been placed in charge of the Mecca Co-operative Date Garden.

Over 2,000 acres of sugar beets have been harvested around Oxnard, Ventura county.

Sixty carloads of grapes were shipped from the Imperial Valley. The season is now closed.

Imperial county which is now commissioned as District No. 45, will hold its annual fair this fall.

Survey is being made for a storm ditch to protect the orchards of Cucamonga, San Bernardino county.

Coachella, Riverside county, shipped 50 cars of cantaloupes, and its neighbor, Thermal, shipped 25.

Orange growers are sanguine of prospects for dollar rate on oranges the same as now prevails on lemons.

Corona ranchers are planning to put in a thousand acres of beets for 1911 delivery to the Anaheim factory.

The Anaheim Sugar Company has purchased a site for its plant north of the city, and will build a 600 ton factory.

Escondido has practically completed plans for her Agricultural Fair which will be held about the middle of September.

The Redlands Golden Orange Association will establish a branch house at Rialto and ship from it both oranges and lemons.

The Oxnard sugar factory turned out 10,215 bags of sugar as result of one day's run last week. This is the largest ever for that factory.

Orange county celery growers have nearly finished planting celery for this season. The acreage will be several hundred acres less than last year.

Not content with the decision of the Interstate Commerce Commission that the $1.15 rate on oranges is just, orange growers will make another effort for a lower rate.

The directors of the Walnut Growers Association at Santa Ana have appointed manager of the packing house for the coming season and are preparing for a big output.

County Horticultural Commissioner Pease of San Bernardino county reports that much poor contract work was done in the orchards of that county last season, also that an early start will be made with fumigation this season.

The Columbia Land and Water Co. of Covina is making extensive additions to its irrigating plant and will be equipped with irrigating facilities for 2,000 acres of Covina land. The officers elected at the recent annual meeting are: T. H. Johnson, President, J. H. Matthews, Secretary.

The Coast

Portland's Live Stock Show opens September 5th.

Wenatchee, Washington, is shipping fifteen cars of fruit daily.

Umatilla county, Oregon, expects to harvest 5,000,000 bushels of wheat.

Grain at Albion, Washington, is averaging thirty bushels per acre.

There are said to be 586,000 square miles of agricultural land in Alaska.

Vancouver, Washington, sheep herders report serious losses from sheep-killing dogs.

Over 100 combined harvesters are owned by farmers within a short distance of Pomeroy, Washington.

It is estimated that the entire wheat acreage of Umatilla, Oregon, will average 25 bushels to the acre.

Great numbers of box cars are on their way empty to Northwestern points to carry away the big wheat crop.

One firm recently bought several thousand tons of alfalfa hay in Umatilla county, Oregon, at $6.00 per ton in stack.

The recently constructed Parker Cut-off of the Santa Fe through Arizona has opened up a large quantity of agricultural land.

Though some injury was suffered from the heat wave, the apple orchards of Oregon report lighter damage than anticipated.

"Jim Hill" mustard in the grain fields of Waitsburg, Washington, has proved so destructive that a concerted attack is to be made on it.

A new irrigation plant at Tucson, Arizona, has brought 2,000 acres of land under irrigation, and is now well planted to beans and sorghum.

A farmer at Longmont, Colorado, has gathered 125 bushels of grasshoppers which he will dry and keep until next winter for chicken feed.

Farmers near Palouse, Washington, are selling timothy hay loose in the field at twenty dollars per ton. This is the highest ever for that section.

One sugar company near Honolulu, H. I., has harvested this year 56,865 tons of sugar. This is the record for any one company on the islands.

The Irrigation Congress to be held at Pueblo, Colorado, will bring together a number of exhibits from Indian reservations in the products of Indians' work.

Property owners near Yuma, Arizona, petitioned the War Department not to permit the Imperial Valley people to erect a temporary dam across the Colorado.

The Department of the Interior has revoked permission formerly given to a power company to flood a large tract of land within the Coeur d'Alene Indian Reservation.

Fruit growers of Idaho, Oregon and Washington, met in Seattle last week and organized the Northwestern Fruit Exchange, a co-operative organization to market the fruit of its members. Headquarters will be at Portland, Oregon. R. H. Parsons. Medford, Ore., is President and W. F. Gwin, Eaglepoint, Oregon, Manager.

Coulson's

EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying power and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

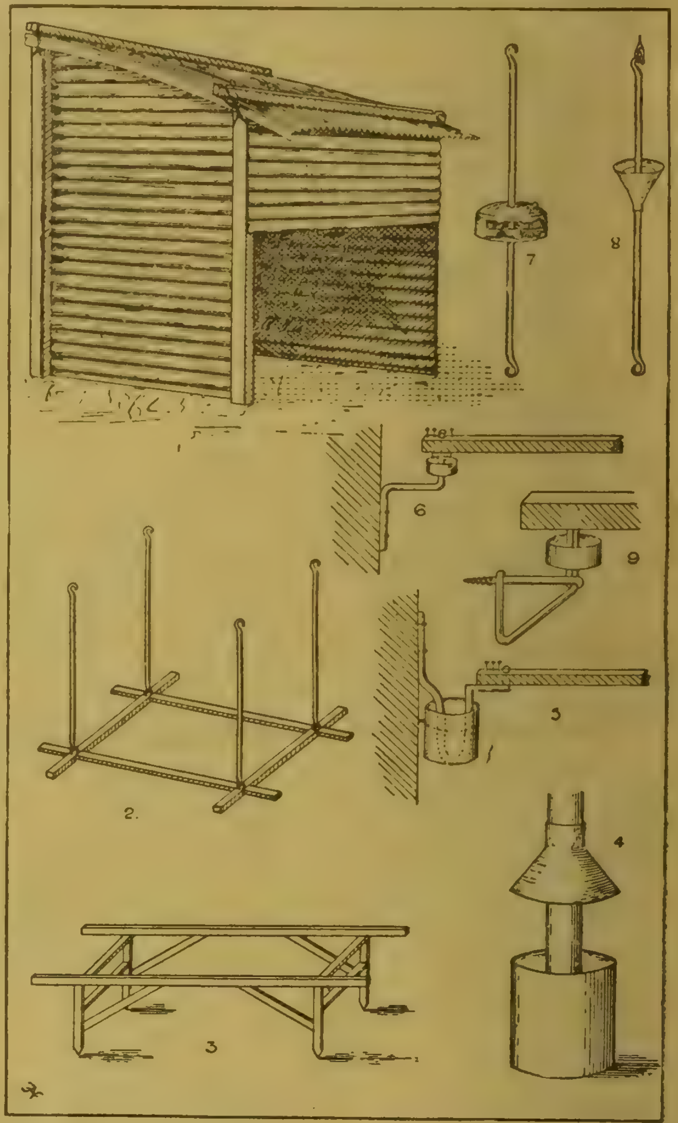
Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

THE FOWL TICK.

NUMEROUS queries have come to the Cultivator on the subject of fowl ticks. One subscriber recently sent lively specimens of the pest and the matter was referred to Prof. Baker of Claremont. He answered by referring us to a Bulletin of the Department of Agriculture of Cape Colony, South Africa. From this Bulletin we reprint engravings on this page and quote as follows:



1. Tick-proof fowl house with woodwork outside. 2. Level roosts to show how supported by rods or wires. 3. Level roosts supported from floor. 4. Suggestion for insulating leg of No. 3. 5 and 6. Method of insulating roosts by tick-proof wall brackets. 7 and 8. Insulation devices for rods and wires, in 7 which is dust-proof (figured with part of side cut away to show oil furrow), oil is poured in through aperture at top. 9. Tick-proof roost bracket

Life History.

The life cycle of the fowl tick has been found strikingly dissimilar in some important respects to the cycles of the several Ixodid ticks, the general habits being found much more like those of the beg bug than of any common tick.

The eggs are laid in the crevices where the creatures habitually secrete themselves. Some observers say that the eggs are sometimes laid on fowls, but not one of the numerous females I have watched has seen fit to trust an egg in such an unnatural situation.

The individual egg is spherical, shining brown, and about one-fortieth of an inch in diameter. The number laid varies; sometimes it is less than twenty, often over fifty, and occasionally over one hundred. The eggs adhere only slightly to one another. Cattle tick eggs are smaller, oval instead of round, adhesive to one another, and are deposited in vastly greater numbers. But Ixodid ticks die at once after egg laying, whereas, the fowl tick lives on, and may feed and deposit other batches of eggs several times subsequently. Egg-laying in warm weather normally begins about a week after feeding, and in about three weeks more the hatching begins.

Injuries.

The fowl tick is regarded by many as the most pernicious poultry pest that we have in South Africa. It is directly responsible for the death of numerous fowls, far more indeed than is generally suspected. It also seems to be the worst of poultry parasites in many parts of Australia and in the southern states of America.

Complaints of its ravages are most frequent in November and December. This is undoubtedly because in these months great numbers almost simultaneously take their first feed after their long winter fast, and because of the brood of young ticks that then appears.

Paralysis is commonly attributed to the attack of the ticks, but, I in-

- Special House for Extra Males or Small Matings—Two Plans.
- Movable Fence for Mature Fowls or Chicks—Six Plans.
- Trap Nest that Traps—Two Plans.
- Special Nest for Five Setting Hens.
- Safe and Convenient Brood Coop for Chicks—Seven Plans.
- Special Coop for use in a Garden.
- Design of Fireless Brooder—Seven Plans.
- Tested Hot Air Brooder—Three Plans.
- Basket for Shipping Eggs—Two Plans.
- Reliable Food Hopper—Five Plans.
- Good Water Fountain.
- Vermin-Proof Roost Support.
- All the above and many more found in the book.
- Built and Used by Poultrymen—Price 50c.

No Chance for Failure

Each of the above designs, and many more, is fully explained by the builder, and illustrated with one or several clear drawings. Anyone can follow the simple instructions. No theories, no extravagant ideas to mislead you, but the money-making, completed houses and coops prove what the Builders say is true. Read their own words and learn how they do it. One plan will pay for the book.

For a Short Time Only

For new subscribers or a renewal to the Cultivator, we will give you one copy of this great book FREE with

"Built & Used by Poultrymen"	$ .50
"The Standard & Poultry World"	.50
"The Cultivator," one year	1.00
Total Value	$2.00
All Three for	**$1.50**

We most certainly recommend this book as one of the best of its kind ever published and our readers should avail themselves of this opportunity at once to get a free copy as above.

Enclosed $1.50 for club order with new book.

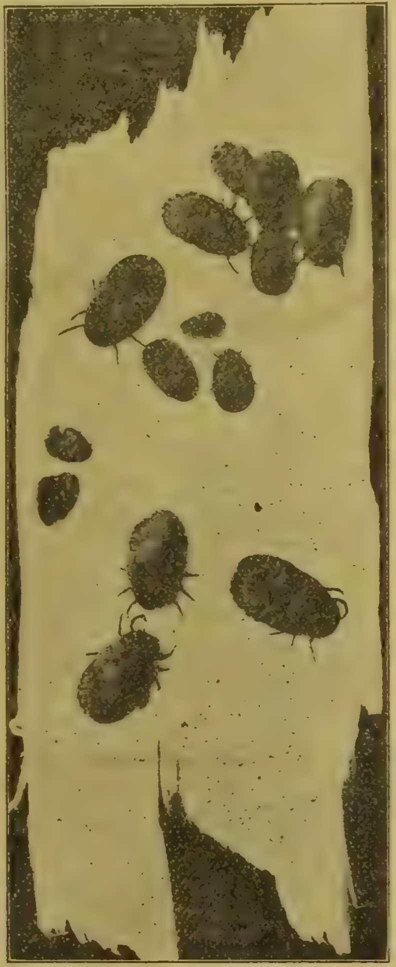
cline to the belief that the victims die entirely from the loss of blood and the inflammation produced by the excessive parasitism. Vast numbers of the creatures take their fill from the legs, and the after irritation and the soreness probably account for the inability to walk often noticed; and birds once lamed and thus made unable to mount the roosts at night become doubly troubled by the pest. Young chickens, being also easily accessible, suffer more than their share, and it is not uncommon to meet with a whole brood almost black from the presence of adhering larvae. The losses are most striking when a fowl house is first occupied after having stood empty for a few months. The hungry ticks swarm to the birds and may kill half or more of them before their presence is discovered.



Sliver torn from woodwork of a fowl house and photographed from behind to show how fowl ticks congregate in such a place; twice natural size.

Remedies.

From a consideration of the habits of the fowl tick, it is apparent that it may be combated in several ways: (1), by seeking them on the walls and roosts by night when they come out to feed; (2) by destroying them in their hiding places with a contact insecticide; (3) by destroying the larvae before they leave the fowls; (4) by so supporting the roosts that the tick cannot reach the fowls.

The first measure is open to the objections that the fowls will be disturbed and that, as only a small proportion of the creatures usually come ont on any single night, it must be continued a long time to be effective. The second, that of killing them in their hiding places, is a good plan, but one that cannot be thoroughly carried out in most fowl houses. A jet of flame from a blast lamp may sometimes be used to advantage for this purpose. The ticks are not easily killed by ordinary insecticides and survive contact with many unless they are thoroughly wetted. Experimentally I have found that sweet oil, paraffin oil, paraffin and sweet oil mixed, turpentine, and benzine, are successful in killing the adult ticks if the breathing orifices are well wetted; but that all are liable to fail when these parts are not reached. The same is doubtless true of carbolic soap dips and sheep washes. Sometimes oil will pucker up one side of a specimen as if the spiracle on that side had been penetrated, and yet did not kill for many days, if at all.

The third remedial measure, destroying the young ticks on the fowls, is frequently recommended in Australian journals. There is no effective fumigant that can easily be used. Arsenical dips such as are used for killing ticks on cattle are worth experimenting with, but I do not know whether or not they would prove successful against the ticks and harmless to the birds. Hand dressing is a slow process but sometimes is practicable. I know of no better dressing than sweet oil. I found that only two out of twenty adults survived a half minute's immersion in undiluted formalin. Larval ticks were not tested. The following notes explain how the pest was overcome in one instance by a combination of measures:

"The plan adopted by me to get rid of the fowl tick was to burn all the old roosts and nests. Then I had the wooden walls well brushed over with hot coal tar. I then slung new roosts of clean deal with edges planed off, from the roof with wire so that no roost touched the walls. In day-time the fowls can protect themselves if they have a good run. On no account should poles with bark on be used for roosts, as the ticks will hide under loose parts. If any ticks make their appearance in nests I make free use of paraffin applied with brush or feather. The floor is regularly swept clean and sprinkled with wood ashes or lime. Since adopting these measures two years ago, I have not lost a fowl by the pest.

"I may add that some of my neighbors have cleared their fowl houses by frequent use of strong solution of sheep dip, applied with spray pump."

One means of isolating roosts by barrier of grease or oil is illustrated by Figure (4). Since fowls tend to roost as high as they can get in a house, it is advisable to have roosts all one height. The roosts pictured are easily removable and hence more thoroughly cleaned than fixed roosts. Roosts shown in 5, 6, and 7 are removable, being simply slipped over peg-like ends of the fastenings.

In the construction of a new fowl house in a tick area, one aim should be to have the building made as nearly tick-proof as practicable. Corrugated iron is regarded as one of the most desirable building materials for this purpose. Another design with all woodwork outside is illustrated on this page. Four upright half deals, one at each corner, support the structure. Strips of corrugated iron laid crosswise form the front, back and sides. Those forming the ends are screwed to the inside of the posts, and those forming the back and front, to the outside. The lower half of the front is left open, but a sheet of iron hinged at the upper side to admit of closing it at night, could be easily added; likewise a sheet at the back could be made to open outward on hinges so that the egg boxes could be inspected from without. The sheets to form the roof are laid in position and then held down by two battens, one at the back and the other at the front, bound by wire to the corner uprights. Sheet iron is preferred by some poultry men on front, back and sides because of less draft within from the corners. It is recommended that the outside of such houses be kept well painted with white refrigerating paint and the inside with tar. So built the house will afford no shelter within which a tick would lay its eggs. The roosts and nesting boxes should be well looked after once a month.

In conclusion, I would recommend that fowls brought to tick-free premises be quarantined for seven or eight days as a caution against their introducing the pest into their new quarters. The quarantine might be in boxes or crates that could be thoroughly cleansed or destroyed.

GERMOZONE

Is the Best Roup Cure I Have Ever Tried

Among the many who say that are a lot who never thought Germozone would do it. Geo. H. Lee knew what Germozone would do before he placed it on the market. It is *so good* that users are not tempted to accept a substitute. No one ever found anything so good. The reason is plain—Germozone has no equal.

500 HENS SAVED

A Missouri poultryman writes that 8 bottles of Germozone saved his *entire* flock of 500 hens from Roup. Less than *one* cent per hen. A Pennsylvanian writes that Germozone would be cheap at $5.00 a box—and it will do for *you* what it has done for others. This advertisement is addressed to *you*. We want your poultry to make more money for you. We want you to recognize the importance of healthy poultry. The health of the chick or the hen is as important to it as your own health is to you. Ever stop to think about it? Perfect health is necessary for positive profit. Try Germozone and test every statement made here. No need to buy a substitute. If your dealer cannot supply you we will mail it to you, postpaid, on receipt of price—50 cts.—and will include *free* a copy of "Chicken Talk," written by Mr. Lee himself.

Come in and see our new 1911 line of Mandy Lee Incubators and Brooders at our newly opened Los Angeles branch, 225 West 2d St.

OMAHA, NEB. LOS ANGELES, CALIF.

How Much Is Water Worth?

Water is very expensive if you are buying a disinfectant that is half water.

Coulson's CRESOLENE

is a powerful disinfectant and germicide made from coal tar. You add the water yourself to make the disinfectant desired strength. COULSON'S CRESOLENE must be diluted from 20 to 100 times its own bulk. It is not poisonous—more powerful than copperas, cloride of lime and other well-known disinfectants. It forms a milky emulsion that only costs 1 1-4 cents a gallon. It is the cheapest disinfectant on the market and at the same time the best. Use it on stock—poultry—dogs or as a general disinfectant and insecticide.

If your dealer does not keep it, order direct from us. Quart cans—50c. Gallon cans—$1.25. Freight free on gallon orders.

COULSON POULTRY & STOCK FOOD CO.

Irrigation and Forestry

THE FORESTS OF ALASKA.

On the coast of southeastern Alaska the average precipitation is about 90 inches and trees grow to a large size; in the Central Plateau, the precipitation is less than 15 inches, including the melted snow, and the average size of timber is small; while on the Arctic Slope, north of Rocky Mountains, and the region adjacent to the Behring Sea, climatic conditions make forest growth altogether impossible, and those vast tundras are covered chiefly with moss, sedges, and a few small shrubs; hence, the discussion of Alaska forests in Forest Service Bulletin 81, recently issued by the United States Department of Agriculture, is necessarily confined to the southeastern coast region and to the Central Plateau, lying between the Pacific Mountain system on the south and the Rocky Mountain system on the north and east, and drained principally by the Yukon and the Kuskokwim rivers.

It is estimated that the total forest and woodland area of Alaska is approximately 100 million acres, or about 27 per cent of the land area of the territory. Of these about 20 million acres may possibly bear timber of sufficient size and density to be used as saw timber, while the other 80 million acres is woodland which bears some saw timber, but mostly only firewood.

The coast region has a mild climate, not colder than the northern part of Puget Sound or of Scotland. The stand of trees is dense, averaging for considerable areas 25,000 feet per acre; Sitka spruce forming about 20 per cent of the stand and western hemlock about 75 per cent. Although by far the most abundant species, western hemlock does not produce as large individual trees as the spruce or western red cedar—the former occasionally showing a diameter of six feet with a height of 150 feet, and the cedar attaining diameters of from 3 to 4 feet.

The usual lumber cut in the coast forests of Alaska is about 27,000,000 board feet, almost entirely spruce, as hemlock is but little used, a large part of this output, probably one-third, being used for salmon cases, and much of the best lumber is used in this way. The southern and southeastern coast having a much larger timber supply than will be needed locally for a long time to come, much of the hemlock should be cut and the spruce be given an opportunity to increase. The cutting that has so far taken place on the coast of Alaska has had but small effect upon the forest, the bulk is yet untouched and as it is now overmature, utilization for other purposes than lumber should be encouraged as much as possible. Both spruce and hemlock are good pulpwood and taken together they comprise almost the entire forests. There is faint prospect that, so far as the coast lumber is concerned, it will ever be needed for use in Alaska. The permanent industries of the coast region are fishing and mining, the mountainous character of the country will forever prevent agricultural operations and the natural barriers prevent this lumber from being of present benefit to the interior where the need is greatest and the price high. Besides the timber itself is not suitable for the structural work that will be needed in the interior when that region is more fully developed and made accessible by railroads. The annual growth of the coast forests is in excess of the local needs, and unless methods of utilization which will result in exportation are developed, these products cannot be rightly handled or properly conserved.

But the interior conditions tell a different story. There the forest stand varies from practically nothing, in areas of scrubby black spruce, to 20 or more cords per acre in the birch-aspen type, and several thousand board feet per acre in the best white spruce forests. The best timber of spruce, birch, and poplar grows in the valleys, particularly along the Tanana in the Fairbanks district. Black spruce predominates in the more poorly drained situations. The average of timber is small, while spruce rarely, and balsam poplar sometimes attains 18 to 24 inches in diameter; the white birch and aspen average 8 inches in diameter, though maximum of 18 inches on unusually favorable sites are noted, and black spruce rarely attains a diameter of 6 inches; while the heights of the different species run from 20 feet for the black spruce to 75 feet for the best white spruce. Naturally it is impossible for timber to grow rapidly or to large size in soil permanently frozen. Unlike the coast forests, those of the interior have suffered much from fires; in some cases ten times as much timber has been killed by fire as has been cut for fuel or lumber.

The bulk of the timber cut in the forests of the Central Plateau is for firewood, several times as much being used for that purpose as for lumber. Nor is this surprising, as the interior of Alaska depends entirely upon wood for heat, light, and power. Wood is burned by the Tanana Valley railroad, which has 45 miles of track out from Fairbanks; the river steamers, except three large boats on the Yukon which use oil, burn wood; and the severe weather of the eight months winter, when the thermometer sometimes goes down to 80 degrees below zero, makes the consumption of fuel in domestic affairs much larger than the population—about 30,000—would use under conditions existing elsewhere.

The present sparse population will undoubtedly be greatly augmented, and its need for timber will be large, therefore, its timber supply should be conserved to lessen as far as possible the heavy expense which importation will entail, as transportation is slow, expensive, and uncertain, and by boats which operate only a few months of the year.

Obviously all the forests of Alaska should be protected and made of the utmost permanent use. They should be managed so as to increase the stand of the best timber—spruce—and decrease that of the less desirable hemlock. Utilization of the present overmature timber of the coast should be encouraged, while the insufficient supply in the forests of the interior should be given the best of care, for it is not likely, with most intelligent management, to be able to furnish more than a part of the home demand, as the high grade timber which may be needed will always have to be imported.

FOREST AND SAWMILL.

The importance of conservation of the forests of the country has always been appreciated by members of the National Lumber Manufacturers Association, but recent agitation of the question has made this need more apparent. The last convention of the association which was the eighth annual and was held in New Orleans in April of this year, gave more time and discussion to reforesting and conservation features of the lumber industry than formerly. The discussions were considered of so much value that they were incorporated in book form and a 275 page book is the result. The secretary of the association is Geo. K. Smith of St. Louis, Missouri.

THE COMPOSITION OF SOILS.

ALL soils are composed of soil grains of different shapes and sizes, and these differences in shapes and sizes have a great deal to do with the fertility of the soil, and with its water holding and air holding capacity. There are two kinds of water in the soil, one existing in a thin film around each soil grain. Hence, the smaller the grain, the more surface in proportion to its size, and the greater the amount of what we call capillary water—which alone is used for growing crops—it will contain.

A sandy soil is always a thirsty soil, for the simple reason that the grains are large, even in the finest sand, and hence can hold comparatively little water. In clay soils the grains are exceedingly fine and close together; hence clay soils hold a vast amount of water in capillary or surface form, although they take up water slowly. Sandy soils take up water rapidly and get rid of it rapidly. So much for capillary water, or water that sticks to the surface of the soil grains and, as above remarked, the only water that is of any use in crop production.

When the spaces between the soil grains are filled up with water, crops cannot grow, for they can use only that portion of the soil that is aerated. It we draw away the water, air fills up the space, and this is the reason why farmers drain their land. The drawing away of this surplus water, or water of gravitation, does not in the least affect the amount of capillary water. Each particle of soil grain when it has opportunity will surround itself with a film of water and will, when evaporation from the surface robs it of its water, get water from below or the water of gravitation. This is what we mean by capillarity. It is by this means that oil rises in a lamp wick and feeds the flame. It is by this that coffee rises in a cube of sugar when you put the edge of it in the cup, because the grains of sugar are pressed close together, but cannot be pressed solid. The reason why surface cultivation of corn retains the moisture of the soil below is because the surface grains are kept so loose, in other words, so far apart, that the water drawn up from below by capillary action cannot climb out and get away.

These are simple elementary statements of facts, and the knowledge that the farmer has of these will have a great deal to do with his farming operations the next year. If he has a piece of ground in which during the entire year the soil is filled with water, he knows it is no use for him to expect to grow a crop. Why? Simply because no grain worth growing will thrive in that kind of soil. In fact, no matter how rich the land is or how deep the soil, no man can cultivate any more than that part of it in which the air is allowed to circulate in the removal of the water of gravitation. If this soil is sandy or gravelly, there is too much air, and the soil grains cannot get enough water for the plants. The finer the soil grains, as in volcanic ash or in clay, the greater the water-holding capacity of that land, and the more it can deliver to the plant if properly handled. The farmer who has to wait until late in the season for the sun to evaporate the water from his land knows two things: that he can use that land only part of the season, and furthermore, that it has been rendered cold by the process of evaporation.

This is probably enough for one lesson; but we wish our readers to study their soils, note the character of the soil grains, note its water holding capacity. They can then so cultivate the land that the maximum of this water can be used for the growing of the crops.—Wallace's Farmer.

DODDER.

It is of the utmost importance that farmers and seed dealers should familiarize themselves with the dodder, otherwise the matter may be talked and written about endlessly and no headway will be made in exterminating the plant from the fields, or in guarding against the use of seed containing dodder. Strictly avoid dodder-infested seed. A purchaser of seed is apt at any time to buy seed containing dodder, unless he has thoroughly examined the seed or has had it examined for him. The cheaper and lower grades of seed, with which some farmers unfortunately are satisfied, are very likely to contain dodder and many other kinds of weed seeds, as well as a large percentage of inert matter and dead seed. Farmers and dealers should become accustomed to the use of a magnifying glass, know common weed seed impurities and make tests for themselves. Thus, if the farmer buys on sample as he should, examines his sample himself, and finds suitable seed, he can without delay purchase his supply from the same bulk lot from which the good sample came. Insist on samples being made up of seed from different parts of sacks or bin; otherwise samples will not be representative of the bulk lots. Though every precaution may have been taken to obtain dodder-free seed, yet a few seeds may have escaped notice and may therefore be present. Thus the clover or alfalfa field will be "spotted" with dodder. Root up everything on the "spots" and burn without moving, or remove and burn if there is no danger of scattering seed. Get far enough out from the borders of the "spots" to make sure that all the dodder is destroyed. Small pieces of plants left continue to grow. Should a field have become generally infested, it is advisable to plow up the clover field before dodder seed is formed. Let the succeeding crop be a cultivated, non-leguminous one. Work out of the ground any dodder seed that may be there, by encouraging them to sprout, and killing the seedlings by cultivation. Should seed have matured before the crop can be plowed under, burn the crop over, then plow and follow with a cultivated crop. Instead of either plowing or burning, shallow cultivation, followed by a cultivated crop kept thoroughly clean, may be resorted to. Here the plan is to cause the seeds to germinate and to destroy the seedlings. Any use desired may be made of the stand of clover on the ground, providing it is cut for hay, pastured or plowed under before the seed is formed. Stubble in the infested field must be plowed under without delay. It should be distinctly understood that dodder is the worst plant enemy.—Indiana Ag. Exp. Sta. Bul.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Snakes—Squirrels.

I note statement regarding squirrels attracting snakes and wish to say that anyone having surplus of snakes may send them to my ranch, as I would like to use them in ridding it of squirrels.—W. A. Doran, San Marcos, San Diego county.

Almond Sheets and Sleds.

Please give me best size and construction of almond sheets and sleds. —T. W. C., Folsom.

This query was referred to Mr. J. P. Dargitz, a large almond grower at Acampo and now secretary and manager of the California Almond Growers Exchange. Mr. Dargitz gives an answer in which we note that the Exchange is prepared to supply all members with sheets. In addition he gives the following information:

"In regard to the best size and construction of almond sled and sheets, will say that I have constructed for my own use this season three sleds 20 feet long. They are on 2x6 runners, and the floor is of No. 3 matched pine flooring, and the sides are of ¾-inch double surfaced 1 x 10 boards. I am using 30 x 30 almond sheets with a hole in the center to fit around the tree, opening from the center to one side.

"If the trees are small, a 24 x 24 sheet will probably be large enough, but the larger the sheet the less almonds to pick up from the ground. We are prepared to supply all our members with almond sheets to a good advantage.

"Cascara Sagrada."

Please allow me to remark that the statement on page 114 of your issue of August 4 is not quite correct. The drug known as "cascara sagrada" is produced only by Rhamnus Purshiana, a native of the northern part of California and of Oregon, which has much larger leaves, but otherwise is very similar to our common Rhamnus Californica, "California coffee." This latter is used as a remedy for "poison oak," and has purgative properties, but not to the extent of the first named. Rhamnus Crocea and its variety Ilicifolia belong to Southern California, the latter exclusively, I believe, and are now known to possess medicinal properties. The very pretty scarlet berries, looking and tasting much like red currants, are, however, reported to have stained in red the bones of the Indians who used to partake of them very freely.

As an ornamental, Rhamnus Crocea, and even more so R. C. Ilicifolia are among our finest native shrubs, and well worth growing in every garden.—Dr. F. Franceschi, Santa Barbara.

Rose Mildew.

I send roses affected with spots and they have a powdery appearance. What is the cause of this condition, and remedy, if any?—G. M., Carpinteria.

These leaves had somewhat the appearance of being affected with common mildew, but at the same time the spots had turned more of a reddish color than usual, so they were referred to Mr. J. Eliot Coit, Acting Superintendent of the Southern California Pathological Laboratory. Mr. Coit answers:

"The rose leaves submitted to us from your subscriber at Carpinteria are affected with the ordinary rose mildew. There are two remedies for this trouble, dusting with sulphur and spraying with a solution of potassium sulphide, three ounces to ten gallons of water. This rose mildew is difficult to handle on account of the fact that preventive measures should be applied very often, if the plants are to be kept healthy."

Carneaux Pigeons.

Is the Carneaux as rapid a squab breeder as the Homer? When a pen is seven years old will the birds breed as good squabs and as rapidly as Homers of same age?—D. D. P., Morganhill.

We are unable to get from pigeon men any information along the line of the query. The Carneaux does not seem to be well known in this state other than that it is considered an excellent breed. Mr. A. W. Bessy, one of the largest breeders of fancy pigeons in the state, also a breeder of fancy canaries, answers our request for information as follows:

"Yours of the 26th to hand regarding the Carneaux being as rapid a breeder of squabs as the Homer. I am told that they are fine for this purpose. Personally, I do not know as I never bred them. My experience has been more with fancy pigeons. As to their being good at seven years old I do not believe that any bird can breed very rapidly at that age, although I have known magpies to breed at 28 years. My experience is that the third or fourth year is the best you get from a pigeon."

Apples for Chickens.

Is there any harm in feeding green apples to chickens? I have an apple tree in yard and notice hens dying after eating. Combs turn perfectly black.—Subscriber, Santa Cruz.

We do not think the death of the chickens is caused by eating apples. The black combs indicate liver trouble which may be corrected by giving diet consisting more largely of green feed and less of grain.

Address Wanted.

Mr. John Bernhard of Ontario would like the address of W. F. Marose a mushroom grower whose article the Cultivator quoted some months ago.

The heavy drop of walnuts during June and July has greatly lessened the prospect for a normal crop in the Tustin and Santa Ana districts of Orange county. The quality so far promises to be good, and far better than last year. With less of quantity, but better quality than last year, growers will probably realize a better price, and be at least as well off as last year. The crop will come earlier.

It is estimated that the new canal necessary to be dug from Sharp's Heading in the Imperial Valley will cost in the neighborhood of a half million dollars.

CELERY BLIGHT AND CONTROL.

(Continued from Page 123.)

in a month or six weeks, depending upon their size, time of year, and moisture conditions. From now on, they should be sprayed every three weeks until the rains start in. The fields at this time of the year should be watched very closely, and if blight can be found, even in the slightest degree, upon any of the plants the field should be sprayed immediately. After the rains have set in the fields should be sprayed at least every two weeks, and if possible, after each storm. It is very important that the plants should be well covered with the Bordeaux for if the blight once gains entrance it is very difficult to check it.

Preparation of Bordeaux Mixture.

The following strength of Bordeaux is strongly recommended:

Bluestone ------------------ 5 lbs.
Unslaked Lime ------------- 6 lbs.
Water ----------------------50 gals.

There are several different methods in vogue by which this mixture is made, but the following has given most satisfactory results:

For example, weigh out 50 pounds of bluestone and suspend it in a sack in a barrel containing 50 gallons of water, leaving this suspended until all the bluestone has dissolved. Next, weigh out 50 pounds of lime, and after carefully slaking it dilute with water to 50 gallons. Great care should be used in slaking the lime, so that in the process it will not be "burned" or "drowned," and it is always best to slake a small amount at a time, rather than using a large quantity.

After the stock solutions have been prepared, they should first be diluted before mixing, and this is of extreme importance. If the solutions have been made according to the above plan each gallon of the lime solution will represent one pound of lime and each gallon of the bluestone solution will represent one pound of bluestone. If the spray tank to be used holds 150 gallons, dip out 15 gallons of the bluestone solution and pour into an empty tank or barrel. Now dip out 18 gallons of the lime solution in another barrel. Then add enough water to the bluestone solution to make 75 gallons, and do the same with the lime solution. They are now ready to be mixed and run into the spray tank. A very convenient and satisfactory method of doing this is by having the barrels on a platform which is a little higher than the spraying machine, and from there the two solutions are run down a V-shaped trough or pipe and the mixture is run into the tank through a sieve. Another method which is commonly employed by the growers in the southern part of the state is to mix these stock solutions, after they have been first diluted, by means of a pump. This does away with the platform and mixes just as thoroughly.

It has been demonstrated by the work done, during the past season especially, that this disease can be controlled by thorough, conscientious, and persistent methods. In order to accomplish the best results from spraying, the fields at the first part of the season must be watched very closely, as the secret of combating this disease successfully lies in the ability of the grower never to let this disease get a foothold in the fields, for the Bordeaux while a very successful preventive is not a cure.

Legal

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Rescission of Lease.

"A" rents for one year a ranch belonging to "B" doing business through an agent "C". "A" paid half the rent asked by the agent when the lease was signed, the lease stipulating that the other half was to be paid in six months. Shortly after the lease was executed "B" came to visit "A" and said the price he wrote "C" to rent the ranch for was less than the price "C" asked "A" to pay and half of which "A" paid when the lease was drawn. "A" asked "C" when the lease was drawn if the price he ("C") asked was the lowest price "B" would take—"C" said yes, when he know that "B" had instructed him to rent for less. The ranch rented last year for the price "B" was willing to accept this year and which he wrote his agent "C" to rent the place for.

"A" now refuses to pay the price asked by the agent claiming he "C" is getting money by false pretense and misstatement of fact. Can "C" collect the full amount mentioned in lease or only amount "B" told him to rent place for?—Subscriber, Pomona.

If "A" were deceived by "C" into renting the property mentioned, "A" might rescind the lease and return the possession of the property to the agent or his principal, demand back the amount of rent paid, and if damaged, might recover damages for deceit from the agent. If "A" desires to make rescission he should act promptly after the discovery of the deceit, and if he has in any way ratified the lease after the discovery of the deceit, it is too late to rescind. "A" has no right to continue in possession of the property under the lease and retain any of the rent agreed upon, without the consent of "B". Of course, with "B's" consent he might do so.

"C" has no right to profit by this deceit, and the excess of rent above what "B" authorized "C" to rent the property for belongs to "B" in case "A" does not see fit to rescind the agreement.—E. L. P.

TRIANGLE TRIP.

Ask Agent For Particulars. Triangle Trip Over The Northwestern Pacific Railroad.

One of the most delightful scenic one-day jaunts in America.

One hundred and fifty miles of mountain and redwood forest scenery, a boat ride on San Francisco Bay and along the Russian River.

Leave San Francisco at 8:45 a.m. daily (and 6:45 a.m. Sunday only) by boat across the Bay of San Francisco, in full view of the Golden Gate to Sausalito, (the Sorrento of America). Thence via picturesque San Rafael and thriving Petaluma (home of the chicken industry), through Sonoma Valley to Santa Rosa and Fulton. From Fulton through magnificent mountain scenery and redwood forests, and along Russian River to Monte Rio. Return is made along the coast, passing Tomales Bay, Point Reyes, San Anselmo, etc., to Sausalito, arriving at San Francisco at 7:35 the same evening.

If preferred, trip can be reversed, leaving San Francisco at 8:15 a.m. via the Coast to Monte Rio and returning along the river and through the valleys, arriving at San Francisco 7:05 same evening. On Sundays an extra train arrives at 9:05 p.m.

Round trip fare for Triangle Trip, $2.80, except on Fridays or Saturdays, it is $2.50 and on Sundays only $2.20.

CALIFORNIA TOBACCO.

Experiments in tobacco growing have been made in California for several years, and a few months ago the Cultivator chronicled the sending out of the first car of California grown tobacco. Soil and climatic conditions are said to be typical, unless it be that the aridity of the climate is an objectionable feature to be considered in the growing. This has, however, been largely overcome in practical experiments and the industry has promise of extension. A new section to take up this work is the Kings River Thermal Tract along the foothills just above the Kings River some 16 or 18 miles almost directly east of Fresno. The M. E. Miller Company which has control of these lands arranged a few months ago with a practical tobacco grower recently from Tokat, Sivas Province, Turkey. In that section which sends out some of the finest Turkish tobacco which is brought to the United States, many conditions are similar to those of eastern Fresno county. It is about 700 feet above sea level and has an average temperature of about 90 degrees, has no fog whatever in the summer or spring months, neither does it have rain during June, July and August. The gentleman's name is Mihran Timoor, and he brought from Turkey with him four different kinds of seed, that of the Smyrna, Samson, Bafra, and Covala. This seed was planted in seed bed during the last of April and first of May and reset in field about the first of June. This two month's field growth shows at this time large stalks already blossoming and the four lower leaves of which are ready to harvest. The bottom, upper bottom, middle, and top leaves are kept separate and graded from the time of picking until the close of curing. The milder leaves are the ones at the bottom. The harvesting extends over about 60 days from the first of August, and the curing is expected to take about 70 days, so that the product will not be ready for marketing before about the first of February.

Those who understand the growing of tobacco assert that these experiments will produce a leaf which will equal, if not excel, many of the choicer varieties imported from Turkey which take millions of dollars from this country annually.

ORIGIN OF THE NAME CALIFORNIA SETTLED.

Professor George Davidson, of San Francisco, the well known geographer and astronomer, after an exhaustive inquiry into the origin of the name California, confirms the contention that it was first used in an old Spanish romance. The tale related to a fabulous island of the Pacific, styled California, where was an Amazon queen called Califia.

The derivation of the name thus invented by the novelist is supposed to have been from two Greek words: "kalli," meaning beautiful, and "ornis," a bird, the latter referring to Califia's griffins, with the letter "f" inserted for the sake of euphony.

This origin of the name is the more probable from the fact that the novel is said originally to have been written in Greek.

Later the name California was used by Bernal Diaz, a Spaniard who wrote a history of the conquest of Mexico. He said Cortez gave it to Lower California, where he founded a colony in 1535. It is assumed that Cortez got it from the romance mentioned.

An old supposition, that "California" was derived from two Latin words meaning "hot furnace," is rejected by Davidson as impossible, and certainly was never in keeping with the climate of the state.

The Professor has written a little book on the subject, which doubtless will be accepted as authoritative, and thus the old question of derivation be set at rest.—Sacramento Bee.

IRRIGATION OF ORCHARDS.

The U. S. Department of Agriculture has just issued a Farmers' Bulletin on the Irrigation of Orchards, by Dr. S. Fortier. This bulletin takes up the subjects of the selection of land for orchards; water supplies; clearing and preparing the land; locating trees; methods of irrigating, and times; duty of water; losses due to evaporation and seepage, winter irrigation; etc. The report contains many illustrations and the material is based on the best practice of the arid region, and is intended primarily for the use of settlers. It is known as Farmers' Bulletin No. 404, and may be had free upon application to any Representative in Congress, or to U. S. Irrigation Investigations, Berkeley, Cal.

WANTED—CONTRACTS FOR CITRUS trees in large amounts, 10,000 or more. O. E. HYDE, Nurseryman, 72 Mary St., Pasadena, Cal.

FARM LANDS FOR SALE.

FOR SALE—OWENS RIVER VALLEY. We are preparing to place upon the market 4000 acres of the choicest apple land in the Owens River Valley, which will include one of the most remarkable gravity water systems in the State. This land is wonderful in its productiveness beyond all belief; potatoes that run 500 bushels to the acre, alfalfa three tons to the cutting, timothy with 12-inch heads, the world's fair prize for honey, and last but not least, the finest apples grown on the Pacific Coast. Red winter apples that look like wax. No other land in California to compare with it. Not flat valley land, but foothill land with gentle slope, giving perfect drainage. The choicest apple land will be subdivided into tens, twenties and forties. The most wonderful scenery in America. Fishing and hunting in the high Sierras right at your door. Trout streams within walking distance. Southern Pacific's new main line east now building through valley, but will not be finished until spring, when this land will be formally open for inspection. In the meantime send in your name and address for booklet, plats and price list, which will be mailed to you as soon as they come from the press. This land is not for speculators but for real serious farmers who know the virtues of choice land, water and climatic conditions when they see them. Will make a special and attractive proposition to buyers who will go in this summer and start their improvements before the formal opening in the spring. Will be glad to take a few serious people with me on my next trip into the valley. JAMES R. H. WAGNER & H. S. COOK, 825 Wright & Callender Bldg., 4th and Hill Sts., Los Angeles, Cal.

FOR SALE—815 ACRES IN SAN LUIS Obispo County. A typical dairy ranch. Plenty of wood, water, irrigable land, buildings, fenced and cross fenced. Orchards, vineyards, oranges, lemons and walnuts do exceedingly well here. 40 acres of land suitable for these. Price $21 per acre. For further particulars apply to MRS. F. A. CLINK, Pozo, Cal.

2285 ACRES CHOICE, DEEP, SANDY loam. Ideal for subdivision or Eucalyptus growing. Can be cultivated any day in the year. Southern Pacific Railroad runs through the ranch. Also close to deep water for shipping. Free from wind and frost. Now all planted to grain. Price $100,000.00 for limited time. GEO. W. SILL & CO., Watsonville, Cal.

APPLE ORCHARDS, LARGE AND small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. GEO. W. SILL & CO., Watsonville, Cal.

FRUITS, FLOWERS, SUNSHINE, progress—all these invite investigating beautiful Hemet Valley, Southern California. Booklet free. WILLIAM KINGHAM, Hemet, Riverside County, Cal.

FOR SALE—EL CAJON GRANT LAND. In the heart of El Cajon Valley, 30 acres of choice vineyard, large house, cottage and barn; trays, boxes, etc. Close to proposed electric line. S. B. HAWLEY, 1548 D. St., San Diego, Cal.

WANTED—HAVE CASH CUSTOMER for good general farm. Must have plenty of water. Send full particulars and right price. PARRISH BARKER, 207 Union Trust Bldg., Los Angeles, Cal.

FOR SALE—WELL EQUIPPED POULTRY ranch, 19⅛ acres, Sonoma County; good house, barn, brooders, incubators and stock. For further particulars address W. LITER, Windsor, Cal.

LIVE STOCK.

JERSEY CATTLE FOR SALE—REGISTERED heifer calf, well bred, $25.00. Unregistered bull calf, $10.00. Unregistered yearling bull, $35.00. HENRY H. JAMES, proprietor Franklin House, Fair Oaks, Sac. Co., Cal.

REGISTERED SHORTHORN BULLS and Poland China Hogs for sale. Best breeding. P. H. MURPHY, Perkins, Cal.

DAIRY SUPPLIES.

MILK COOLERS, BOTTLES, CAPS, brushes, Buhl milk cans, Sharples separators, Babcock testers, veterinary instruments, wood soled boots and shoes, and our celebrated "Prosperity" washing powder. GUY F. KELSEY, 108 E. 8th St., Los Angeles, Cal.

RARE PLANTS.

FINEST THINGS FOR LAWNS. Feathery, not running, Bamboos; Arundinaria falcata, and Arundinaria Falconeri. For sale by the MONTARIOSO NURSERY, Box 1500, Santa Barbara, Cal.

WILD PLANT IMPROVEMENT GARDENS, Santa Ana, California. NEWTON B. PIERCE, Proprietor. Rare choice ornamentals and new fruits from all lands.

POULTRY.

WHITE ORPINGTONS—COOK STRAIN. We offer for sale a limited number of trios and pens of utility and exhibition stock at bargain prices for the summer season. Our breeding pens are imported direct from Wm. Cook & Sons, Scotch Plains, N. J., and are sons and daughters of first and second prize winners, Madison Square Garden. Messrs. Cook & Sons say of them: "They are all from some of the finest birds in this country." Book orders now for next season's hatching. Eggs $5.00 per 15. $25.00 per 100. Day old chicks 50c each. October delivery. RANCHO LA SOLANA, Box 143, Chula Vista, Cal.

HOW TO MAKE MONEY—MRS. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the 'Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1.00. Address MRS. A. BASLEY, Box 77, Venice, Cal. Send postal.

LOVELL'S BLACK MINORCAS
California's
Greatest Egg Producers
Pedigreed, trapnested, scientifically bred. Free circular. DAVID J. LOVELL, 5720 So. Park Ave., Los Angeles, Cal.

"How can I teach your children gentleness,
And mercy to the weak, and reverence for life,
When by your laws, your actions and your speech,
You contradict the very things I teach?"
—Longfellow.

HOW I EDITED AN AGRICULTURAL PAPER.

I DID not take the temporary editorship without misgivings. But circumstances made the salary an object.

Being at work again was luxurious. All week I wrought with unflagging pleasure. I waited a day with solicitude to see whether my effort was going to attract notice. As I left the office a group at the foot of the stairs dispersed and I heard one or two say "That's him." I was naturally pleased. Next morning I found a similar group and scattering couples and individuals in the street watching me with interest. The group fell back and I heard a man say, "Look at his eye." I pretended not to notice, but secretly I was pleased, purposing to write an account of it to my aunt. I heard cheery voices and a ringing laugh as I drew near the door, which I opened and caught a glimpse of two young, rural-looking men. Their faces blanched and lengthened when they saw me and they plunged through the window.

In about half an hour an old gentleman with a flowing beard and a fine but austere face entered. He seemed to have something on his mind. He set his hat on the floor and took out a red silk handkerchief and our paper. While he polished his spectacles he asked: "Are you the new editor?" I said I was. "Have you ever edited an agricultural paper before?" I said "No." "Have you had any experience in agriculture practically?" "I believe I have not." "Some instinct told me so," said the old gentleman, looking at me with asperity. "I wish to read what must have made me have that instinct. It was this editorial:

"'Turnips should never be pulled. It injures them. It is much better to send a boy up and let him shake the tree.'

"What do you think of that?"

"I think it is good. It is sense. Every years millions of bushels of turnips are spoiled in this township alone by being pulled half ripe, when, if they had sent a boy to shake the tree—"

"Shake your grandmother! Turnips don't grow on trees!"

"They don't, don't they! Who said they did? The language was intended to be figurative. Anybody that knows anything will know that I meant that the boy should shake the vine."

Then this old person tore his paper into shreds, broke things with his cane and said I did not know as much as a cow. I fancied he was displeased about something. But, not knowing what the trouble was, I could not help.

Pretty soon a long, cadaverous creature darted within the door. After scanning my face a while he drew our paper from his bosom and said: "You wrote that. Read it, quick. Relieve me. I suffer."

As the sentences fell from my lips I could see the relief come, the drawn muscles relax, the anxiety go out of the face and rest and peace steal over the features like the merciful moon-light over a desolate landscape.

"The guano is a fine bird, but great care is necessary in rearing it. It should not be imported earlier than June or later than September. In the winter it should be kept in a warm place where it can hatch its young.

"We are to have a backward season for grain. Therefore it will be well for the farmer to begin setting out his cornstalks and planting his buckwheat cakes in July instead of August.

"Concerning the pumpkin: This berry is a favorite of the natives of the interior of New England, who prefer it to the gooseberry for making fruitcake, and likewise give it the preference over the raspberry for feeding cows, as being more filling and fully as satisfying. The pumpkin is the only esculent of the orange family that will thrive in the north except the gourd and one or two varieties of the squash. But the custom of planting it in the front yard with the shrubbery is fast going out of vogue, for it is generally conceded now that the pumpkin as a shadetree is a failure.

"Now, as warm weather approaches and the ganders begin to spawn—"

The excited listener sprang toward me to shake hands and said: "There, that will do. I know I am all right now. You have read it as I did, word for word. But when I first read it I said to myself: 'I never believed it before, notwithstanding my friends kept me under watch so strict, but now I believe I am CRAZY.' With that I fetched a howl you might have heard two miles and started to kill somebody. I read one of them paragraphs over again, to be sart'n, and then burned my house. I have crippled several people and have one fellow up a tree where I can get him if I want him. But I thought I would call as I passed and make perfectly sart'n; and now it is, and it is lucky for the chap in the tree. I should have killed him, sure. Goodby. You have taken a great load off my mind. My reason has stood the strain of one of your agricultural articles and I know that nothing can ever unseat it now."

I felt uncomfortable about the cripplings and arson, for I could not help feeling remotely accessory to them. But these thoughts were quickly banished, for the regular editor walked in. The editor was looking sad and perplexed.

He surveyed the wreck and said: "This is a sad business. There is the mucilage bottle broken, six panes, a spittoon and two candle sticks. But that is not the worst. The reputation of the paper is injured—permanently, I fear. True, there never was such a call for the paper before; it never sold such a large edition or soared to such celebrity; but does one want to be famous for lunacy and prosper on infirmities of mind? * * * You speak of a furrow and a harrow as being the same, talk of the moulting season for cows and recommend the domestication of the polecat on account of its playfulness and its excellence as a ratter. Your remark that clams will lie quiet if music be played to them was superfluous. If you had made acquiring ignorance the study of your life you could not have graduated with higher honor than you could today. Your observation that the horse-chestnut as an article of commerce is steadily gaining in favor is calculated to destroy this journal. It makes me lose patience every time I think of your discussing oyster beds under landscape gardening. Why didn't you tell me you didn't know anything about agriculture?"

"Tell you? I have been in the editorial business going on fourteen years, and this is the first time I ever heard of a man having to know anything in order to edit a newspaper. You try to tell me anything about the business! I have been through it all from Alpha to Omega, and the less a man knows the bigger noise he makes and the higher salary he commands."—Mark Twain.

◆

CHOPPED MEATS.

Chopping meat is one of the principal methods of making tough and inexpensive meat tender, i. e., dividing it finely and thus cutting the connective tissue into small bits. Such meats have another advantage in that they may be cooked quickly and economically.

In broiling chopped meat the fact should be kept in mind that there is no reason why it should not be cooked like the best and most expensive tenderloin. The only reason that ever existed for difference in treatment was the toughness of the connective tissue, and this feature has been overcome by the chopping. The ideal to be reached in broiling steak is to sear the surface very quickly, so that the juices which contain the greater part of the flavoring of the meat shall be kept in, and then to allow the heat to penetrate to the inside until the whole mass is cooked to the taste of the family. To pass the point where the meat ceases to be puffy and juicy and becomes flat and hard is very undesirable, as the palatability is then lost. Exactly the same ideal should be kept in mind in broiling chopped meat. If this were always done, hard, compact, tasteless balls or cakes of meat would be served less often. To begin with, the broiler should be even more carefully greased than for a whole steak. This makes it possible to form the balls or cakes of chopped meat with very little pressure without running the risk of having them pulled to pieces by adhering to the wires of the broiler. They should be heated on both sides even more quickly than the steak, because the chopping has provided more ways of escape for the juice, and these openings should be sealed as soon as possible. The interior should be cooked to the taste of the family just as the steak is.

In regard to broiling it may incidentally be noted that housekeepers often make themselves unnecessary work when broiling under gas by allowing the juice from steaks or meat balls to drop into the large pan under the rack. A smaller pan set in the larger one may be made to catch all the juice and fat and is much easier to wash. It serves also to economize the gravy.

Chopped raw meat of almost any kind can be very quickly made into a savory dish by cooking it with water or with water and milk for a short time, then thickening with butter and flour, and adding different seasonings as relished, either pepper and salt alone, or onion juice, celery, or tomato. Such a dish may be made to "go further" by serving it on toast or with a border of rice or in some similar combination.

Tough Portions of Porterhouse Steak.

Before speaking of the cooking of the cuts that lack tenderness throughout, it may be well to refer to the fact that the flank end of the porterhouse is to be classed with the toughest of cuts and with those which, when cooked alone, are with difficulty made tender even by long heating. Mock duck, which is commonly made out of flank steak, can be rendered tender enough to be palatable only by long steaming or cooking in water, and yet people quite generally broil this part of the steak with the tenderloin and expect it to be eaten. The fact is that to broil this part of the porterhouse steak is not good management. It is much more profitable to put it into the soup kettle or to make it into a stew. In families where most of the members are away during the day the latter is a good plan, for the end of a steak makes a good stew for two or three people. This may be seasoned with vegetables left from dinner, or two or three olives cut up in gravy will give a very good flavor; or a few drops of some one of the bottled meat sauces, if the flavor is relished, or a little Chili sauce may be added to the stew. But if the tough end of a porterhouse is needed with the rest, a good plan is to put it through a meat grinder, make it into balls, and broil it with the tender portions. Each member of the family can then be served with a piece of the tenderloin and a meat ball. If the chopped meat is seasoned with a little onion juice, grated lemon rind, or chopped parsley, a good flavor is imparted to the gravy.

HOMELESS CHILDREN

Want fathers and mothers. Cultivator readers have taken hundreds of them, and they tell us of mutual happiness and satisfaction.

No home is complete without a child in the house.

Favorable arrangement can be made.

OUR SPECIAL GROCERY CATALOG
BRIGHTENS FIVE HUNDRED THOUSAND HOMES

This is probably the most asked for "Book on How to Save Money" and "Reduce High Cost of Living" that has ever been given away, and there is a good reason for it.

FIRST Because it has proven to the buying public that merchandise purchased from a retailer must of necessity have paid four distinct profits, viz: (1) Manufacturer to jobber, (2) jobber to wholesaler, (3) wholesaler to retailer, (4) retailer to consumer.

SECOND Because it has proven to the buying public that the merchandise purchased from the largest and only exclusive mail order house in the West entails only one small profit from **US DIRECT TO YOU, THE CONSUMER.** Therein lies the secret of our success.

OUR EXCEPTIONAL BUYING FACILITIES Enables us to handle merchandise of the highest quality and sell at prices within the reach of everyone at a saving of 25 to 50 per cent over that of the retailer.

IT WILL PAY YOU BIG To buy all of your goods through this catalog, besides the great saving you can make by trading by mail. It is the easiest and most satisfactory way of purchasing goods, therefore, you owe it to yourself as well as to us to send for **OUR SPECIAL GROCERY CATALOG TODAY,** sent you postage prepaid. **IT COSTS YOU NOTHING,** but saves you money. Our unqualified guarantee, "Satisfaction or your money back."

Amber ...	10@12
Extracted W W	7½
Extracted light amber	6½@7
Beeswax, per lb	24@30

Hay.

Scott, Magner & Miller report:

Receipts of hay on the market during the week ending today have totaled the large sum of 5600 tons. On last Monday the market was burdened with about 1500 tons. It was impossible to move from the railroad cars the entire arrivals, and therefore demurrages of $6.00 per car per day were imposed upon those cars that were not removed within 48 hours after arrival. The market seemed demoralized and without proper or satisfactory basis.

The export demand has been very moderate.

Alfalfa hay is the exception to the general dull condition of the market. Inquiries from the North for large quantities of alfalfa hay have been received in this market and considerable alfalfa has been sold to this trade. In view of this large outlet for alfalfa, and the fact that the dairymen and other large consumers of alfalfa have not yet laid away their winter supply, there is a decided firmness in the alfalfa situation, and it is expected that this article will further advance.

The demand for straw is decidedly light, as quantities of cheap hay are now being used for bedding purposes.

Fancy wheat	12.50@13.00
No. 1 wheat or wh and o	10.50@11.50
No. 2 wheat or wh and o	9.00@10.00

Cocoanut cake per ton	25.00
Mixed feed, per ton	24.00@30.00
Shorts ...	24.00@26.00

Deciduous Market

SACRAMENTO, Cal., Aug. 6, 1910.

The following from the circular of the California Fruit Distributors gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, August 5, 1910.

Peaches.

Two hundred and sixty-eight and one-half cars. As predicted last week, there has been a considerable falling off in the shipment of this variety of fruit during the past week and there will be a further decline in the coming week. There will be a reasonable quantity of fruit available, but the large supplies for the season have been exhausted. There will be ample supplies of our finest Yellow Clings available during the next two or three weeks.

Plums.

One hundred and ten and three-fourths cars. A slight decline in the shipment of this variety is to be noted but not as great as was expected. The same varieties are going forward as were being shipped last week. It is not expected that plum shipments will keep up to this volume for more than a few days.

Pears.

Two hundred and seventy-one cars Over 100 cars less of pears went ou this week than the preceding one There will be a further decline durin the coming week. Fall and winte pears are reported as being a ligh crop.

Grapes.

One hundred and sitxy-one car Nearly three times as many grape went forward this last week as during the preceding seven days. Varieties continue the same as last week Increased quantities of Malagas ar now going forward and beginning th latter part of the week some fine Blac Prince will be available in carlot Grapes have been of unusually goo quality so far and this is expected t prove true throughout the season.

Weather conditions have remaine favorable since our last report.

ALMONDS.

The Almond Growers' Associatio sends the following circular under da of Aug. 9:

Word from Rotterdam gives quotations on almonds that sound good us. Sicily almonds are offered Rotterdam for September and October delivery at prices which are a surprise.

Advices from Leghorn indicate a ood crop 'in Sardinia (hardshells). rench dealers, however, are already idding for these almonds, which conrms the reports of short French crop. pening prices would indicate about ¼c. delivered New York, duty paid.

Liverpool advises as follows: "The atania (Sicily)) and Valencia (Spain) rops of almonds are said to be very hort, shorter than last year. No rices have yet been made."

Our selling agents report great volme of correspondence and that somehing will come to a head shortly. In ict we hope to be in a position to uote out prices and go to selling now n about ten days.

Harvesting is progressing. Everyhing moving according to program nd like clockwork. Several Associaions have added new members in the st week, one of them representing a arload.

Our shipment of almond bags arived at San Francisco the 5th and will e shipped out to the various Associaions by the 9th or 10th.

Citrus Market

LOS ANGELES, Aug. 10, 1910.

Valencias have eased off slightly, due ɔ large number of shipments. There as been a desire to clean up and close number of the packing houses, which as induced the heavier shipments. At he present time there is a material alling off of shipping and this shrinkge will doubtless correct the market within the next week. In any case the mall quantity of fruit to go will comand fair average.

Lemons are very strong. Foreigns re coming in limited quantities and ndications are for present prices of 5.50 and $6.00 f. o. b. Southern Caliornia points. If given hot weather rices will be still stronger, but anyhing lower than present can hardly be xpected for the coming three months nder any weather condition.

hipments.

Shipments of citrus fruits to date ince November 1, 1909, 28,041 cars, of which 23,936 were oranges and 4,105 emons. To same date last year, 34,760 ars, of which 29,307 were oranges and 453 lemons.

NEW YORK, Monday, Aug. 8.—With ecreasing supplies and an active demand, the market for California late Valencia oranges was strong with an upward tendency on fancy fruit, which brought comparatively high prices at oday's auction sales.

OUR SPENDTHRIFT REPUTATION.

The Montreal Star throws a sidelight upon Canadian relations with the United States in an article on reciprocity and conservation. Referring to negotiations said to be progressing favorably between the dominion government and Belgium and Italy for trade agreements, the Star says frankly that the advantages of trade with the United States are obvious because of the proximity of the two countries, their mutual trade needs, and the nearness of markets. It concedes that immediate gain to Canada is likely to be greater from trade with the United States, but it turns from this aspect of the case to consider the advantages of trade with Belgium and Italy, which it regards as none the less important for being less obvious. It notes the fact that "immediate trade gain and the welfare of the Dominion may be two very different things." And here is the interesting point of the argument to us on the south of the Canada line:

"One of the outstanding needs of Canada is capital for the development of her resources. We are likely to obtain that capital from countries with whom we do a large trade. The capitalist will bring with him the method of development to which he is accustomed in his own land. The American capitalist has wasted his own resources and he is not likely to conserve ours. The European capitalist—the capitalist of Belgium, of Italy, and in a high degree of Germany—has learned well the lesson of conservation. If we can secure the development of our resources by European capitalists, we will be likely to get a development which will guard the interests of future generations and enrich instead of impoverish the country. If we give the American free scope, he is likely to land us where he has already landed his own nation. These are strong and far-reaching reasons why we will do well to encourage the European trader to come among us and bring in his wake the European Capitalist."

Does this argument seem overdrawn? It must be remembered that Canada views questions sometimes in a large way and looks deeply into things for causes and effects. It has often happened that her policy has been directed by visions of imperial development, and we know that on the subject of conservation, while Canada may not be talking as much as the United States, she is taking positive action in many directions, notably in that of forest protection.

The viewpoint of the Star is especially significant in its exposition of the fact that we are looked upon from outside as an extravagantly wasteful people whose methods cannot be trusted. Of course, we are disposed to reply with a loud patriotic flourish, accompanied by the eagle and the flag. But perhaps it will be more profitable to sit down quietly and consider the reasons for our neighbor's opinion of us and its probable effect upon our standing as a nation. —American Forestry.

Every city, village, and country town should be liberally supplied with drinking fountains for animals, and they should be so constructed that even the smallest dog can drink from them. The person who provides a fountain at which man and beast can drink pure water, is truly a public benefactor.

"My life," sighed the insurance agent, "is full of wormwood and gall." "Is that so?" asked the victim. "Funny I overlooked the wormwood!" —Cleveland Leader.

"Search diligently into the truth, rather than suffer an erroneous impression to pervert your judgment." —Phaedrus.

Business Notes

Attention is called to the new advertisement in this issue of Dr. R. R. Snowden. The Doctor's work is a departure from the routine "complete analysis" of the soil, and is more useful although costing less, since it has a direct relation to both the immediate and permanent returns from the orchard. His article in this issue on the effects of an inadequate proportion of lime to magnesia on citrus trees is evidently the result of a large amount of work done on citrus orchard soils, and appears to throw light on the subject. If his conclusions are correct there can be scarcely a doubt of the great value of the work he has done for the citrus orchardists. It will pay you to read the ad. Mention the "Cultivator."

The Smooth Running Pomona Deep Well Pump

RELIABILITY.

Has passed through another most successful season's run, this being the fifth since starting.

There is no experiment in buying a POMONA PUMP. All the parts have been tried out and fully perfected. They will do the work, we know, and do it well.

We have records of plants that have made three seasons' run without one cent for repairs of any kind.

ECONOMY.

May be driven by a steam engine, gas engine or electric motor and in any case will give you the cheapest water and pay dividends on your stock.

Any Water Company going into the Irrigation business will run no chances in buying the POMONA PUMP. They are built heavy and strong. All the wearing parts are Bronze Bushed or Babbited and will last a life-time with the smallest outlay for repairs.

We can refer you to customers who are operating their POMONA PUMPS for less than one-half cent per inch per hour on 200 feet lift. This is less than half what their water costs with other pumps. The same make of engine being used in both cases.

Where the Gravenstein Apple Reigns Supreme

Editorial Observations on the Apple Show at Sebastopol, Sonoma County

HORTICULTURALLY California can be said to be a country of startling surprises; what yesterday appeared to be only of nominal value, today becomes a source of income to a people, and a matter to be seriously discussed in the halls of finance and in the atmosphere of trade and economics. In other words arid areas are converted into productive fields, and barren deserts into fruit growing sections. This fact was strikingly brought to mind on the part of the writer by a visit to the apple growing regions of Sonoma county, and to the splendid apple show that has only just closed in the prosperous town of Sebastopol. For be it remembered that it was not so many years ago that these same lands were thought to possess a value only for sheep ranges and grain fields.

Perfect Soils for Fruits.

For the most part the low lands of Sonoma county are adobe soil, the character veering to a sandy loam as one approaches the foothill sections. These are admirably adapted to the culture of berries and deciduous fruits, and more especially the apple,—a fruit which has been grown there more or less for twenty-five years, but has only of late years assumed a commercial importance warranted by its quality as well as quantity. To give force and tangible expression to this fact, the apple growers of that entire region have organized themselves into the Gravenstein Apple Growers' Association. And why limit their operations to a single variety? As one Shakespeare was wont to say, "Thereby hangs a tale."

A Good Apple.

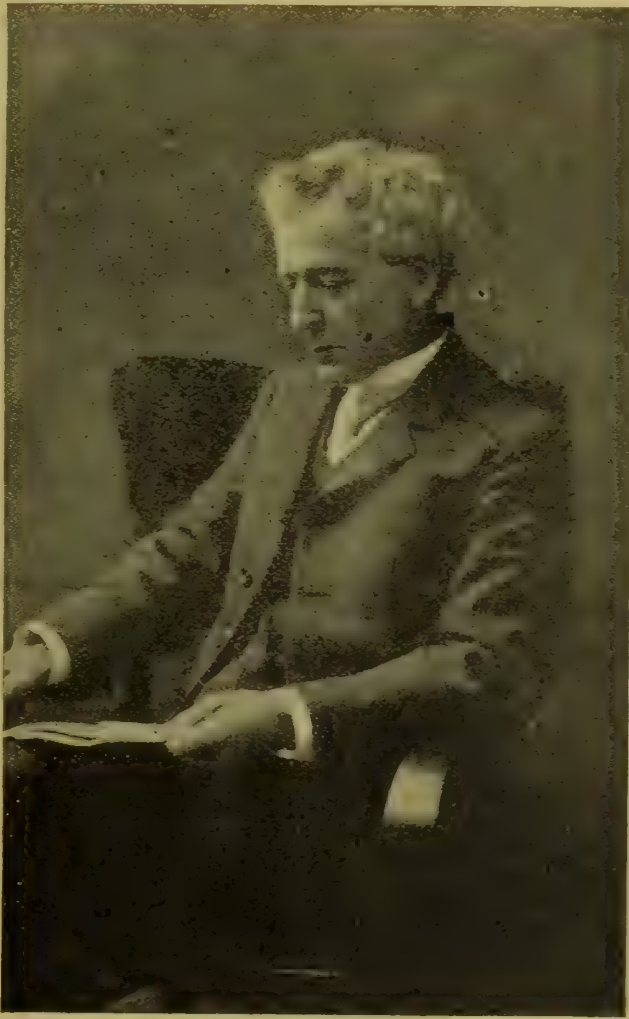
The law of the survival of the fittest and its corollary, the law of elimination, like old Father Time, rights all things. It has been found by years' experience that the Gravenstein apple is to that fruit what the Washington Navel orange is to the citrus industry, namely, the best all around apple that that region will grow. It is not only a handsome fruit, appealing to the eye, but it is a good eating apple, is a fine fruit in the culinary arts, a good dryer and a splendid shipper. Indeed they will tell you at Sebastopol that you can ship it to London and back again without injury, which of course may be as bad as sending coal to Newcastle, but it gives emphasis to a fact.

Description.

Technically the Gravenstein apple is rather large, a little flattened, a trifle one-sided and broad at the base; stalk rather short and well set; calyx large; skin from pale to deep yellow, surmounted with a reddish and irregular blush varying more or less according to the season; flesh crisp and tender, and it has an aromatic flavor at once pleasing and palatable; tree a strong grower and regular bearer. These strong characteristics have placed it in the lead in Sonoma county, where it finds ideal conditions for its highest development.

The Show.

This initial apple show was not only an agreeable surprise to the visitor from a distance, but it was no less so to even the oldest inhabitant. It is debatable if many of use realize the substantial horticultural advance that is being made in nearly every section of the state. We are quite apt to dismiss Sonoma county with the thought that she stands supreme in poultry culture, and let it go at that. But the truth is she also stands high in deciduous fruit production, especially in small fruits and apples. Her crown of glory, however, is her Gravenstein apple—a fruit that is in a class all by itself.



LUTHER BURBANK.

Sonoma County's representative Horticulturist and Plant Breeder.

Advanced Pomology.

And for this reason if for no other it was a fitting and handsome thing for her enterprising growers to initiate an annual Gravenstein apple show exploiting her pomology to the world calling attention not only to her superb product, but also to her advantages of soils and climates in the development of an advanced pomology.

Build Bigger.

But to the show proper. It was held in a tent, which should have been as large again in order to have avoided crowding and given aisle space to accommodate the throngs of visitors. All told there were shown 4000 packed boxes of fancy apples fully eight per cent of which were Gravensteins. In addition to these, there were used 1000 additional boxes for fashioning the feature exhibits. Many of the latter were strikingly original and elaborate in conception, and added much to the show as attractions, though of course in no sense possessing the educational features nor the economic values that the regular commercial displays possessed. The quality of fruit as well as the commercial packs at once gave evidence of the care and thoroughness with which the growers conduct their operations from the planting and care of the trees to the finished product as it reaches the consumer.

Other Displays.

In addition to the apple exhibits, which covered the fruit in a fresh and dried state, also preserved and cidered, there were minor displays of the stone fruits, ornamental foilaged and flowering plants, and a superb showing of Luther Burbank's introductions, which contained a number of his late introductions which have not yet been put on the market. Much of this exhibit aroused keen interest, and but for Burbank's request not to give detailed descriptions until he places the same, I would go more into details here.

The new pomology of California has much to its credit, not the least of which is the work of Burbank. Indeed, the apple show itself was due not a little to his initiative and enterprise.

In reply to the question, "Why the Gravenstein Apple," Luther Burbank furnishes the Cultivator the following:

"The Gravenstein Apple, has above all others, proved to be the money winner in Sonoma county. It is a healthy, vigorous tree. It always bears a good crop, never overbearing, as many varieties do; is of the best quality of all known apples, taking into account all uses to which the apple is put. It is the best drying apple for the quality and appearance when dried. It is handsome in appearance, good size, superior quality for dessert or cooking, and especially for market. It cannot be raised successfully in the hot valleys. Sonoma county seems to be its home. It has oft been said that if the Gravenstein apple could be had throughout the year no other apple need be grown."

The Governor There.

The show was opened on the evening of August 10 by appropriate remarks by Mayor James P. Kelly of Sebastopol, and Pres. McDonald of the Association, who introduced Gov. Gillett, who made the principal address. The officers of the Association are: J. P. McDonald, president; L. V. H. Howell, vice-president; E. E. Jewell, secretary. Directors: W. I. Newcomb, J. W. Turner, Charles Hotle, L. E. Varner, W. W. Monroe, H. R. Harbins, J. J. Alves, E. W. Maddocks, George D. Sanborn, E. E. Morford, J. P. Kelly, George McFarland, A. B. Swain and J. P. McDonell.

A list of the awards may be seen in Deciduous Department.—

Citrus and Sub-Tropical Fruits

BLISTERING.

BECAUSE of report that spraying for thrips had caused a scarring or blistering of young oranges in Tulare county, J. R. Norton of the Bureau of Entomology made an investigation and reports as follows:

"For the benefit of those who are vitally concerned in the control of the orange thrips, it seems that the facts regarding the particular injury which caused the article referred to above to be written, should be stated.

"On July 5th a trip was made to the Sunnyside district, where it was claimed that "a large proportion of fruit hangs on the trees badly blistered. The first orchards visited were those of Mr. Carr and Mr. Hemphill, both thoroughly sprayed with lime-sulphur and tobacco extract according to directions given by the Bureau of Entomology. Mr. Carr's orchard is situated east of the road and extends well up on the hill, where it is well known the temperature is greater than in the lower land west of the road. With the owner and Mr. Smith a careful search was made in the upper portion of this grove, but not a single orange or leaf could be found which showed any sign of "blistering," from whatever cause. Mr. Carr stated that he had seen no injured fruit on the place.

"Mr. Hemphill's grove begins a mile or so south of Mr. Carr's and extends from the road west to the canal with a block also between the canal and the railroad track. In one block of perhaps 200 trees, just across from his house and between the road and canal some damaged fruit was found. The amount can easily be estimated, and roughly, would be about 2 per cent, or two oranges in every hundred. A similar condition was found in a young grove about one-quarter mile north of this.

"At first glance it would appear that such injury occurring in fruit known to be sprayed must be caused by the spray. But this hasty conclusion was not borne out by the facts.

"In the unsprayed orchard adjoining Mr. Hemphill on the north and lying between the two sprayed blocks, where the injury was first found, some of the oranges showed exactly the same injury. No other portions of Mr. Hemphill's grove than those mentioned showed any of this so-called 'scalding.'

"A sprayed grove just across the road from Mr. Hemphill's and farther up on the hill was next carefully searched for injured fruit. Not a single orange showing even slight 'scalding' could be found. This grove was sprayed by the same men who sprayed Mr. Hemphill's, using the same outfit.

"The next grove examined was Dr. Barber's, lying further over on the east slope of the hill. A portion of this grove was sprayed during the hottest days of the month, yet no injured oranges could be found there.

"Not a single complaint of any injury that could be attributed to the lime-sulphur spray or to a combination of this spray and great heat has come to my attention from any other part of the orange district.

"However, a careful examination was made of foothill groves in the Lindsay district. In one of these lying well upon the hill east of Lindsay, the other two in the El Mirador district, all chosen because they are located in high, hot sections and were sprayed on the warmest days, not a trace of this injury could be found.

"Now, just what caused the discoloration and toughening in the rinds of those few oranges at Sunnyside, which has given us this alarm, is very hard to say. But there is good evidence that some other conditions than lime-sulphur and great sun heat must be present."

CUBAN PINES.

The following account of the pineapple industry in Cuba is taken from a report of a commission of Florida growers as printed in the Fruitman's Guide and will be of interest to our readers.

The Floridians say that the pineapple industry is confined to within fifty miles of Havana. They were first grown in the outskirts of Havana and have gradually drifted westward, the center of the old section being Punta Bravo, about twenty miles west of Havana, where they have immense packing-houses well equipped; for instance, they have nailing machines driven by electric motors, but do not have packing tables as the Cubans cut them and put them on the floors a day before packing, then one man sizes them, another wraps, another places in crate and still another nails up the crates, which seems rather a slow and expensive way to the Florida grower. The crates are made the narrow way and get a larger apple to the same size than the Florida grown pine, owing to the smaller crowns.

Cuban pines are cut instead of broken in picking the majority owing to the slips growing so close to the apple. It seems the universal price for cutitng, hauling to packing-house, packing and placing aboard cars is 50 cents per crate, and sometimes more; however, this seems to be the usual contract and cost price.

Pineapples are grown in Cuba on beds thrown up like sweet potato rows in Florida, about five feet apart and planted in single rows one foot apart on beds nearly one hundred paces long.

This is called the "Cantero" system, and from observations in different sections in experiments by Americans, the "Cantero" system is the only practical way to grow pines in Cuba, as it enables them to keep out the grass and keep dirt around the suckers so they can take fresh root each season. They plant between seven and eight thousand plants per acre by using this system so that it takes two acres there to make one in Florida. The actual cost of plowing, buying of plants and setting is about fifty dollars per acre, the price paid in contracts the past season.

About three years is the average life of a field, the third crop very often being very small apples unless the field is well kept.

Some are using fertilizers as an experiment, but it does not seem necessary nor profitable. All the growers claim they can and do replant their ground again and again, some claim with better results.

Mr. Orchardist

I do not advise a complete analysis of your soil. This is the work that is responsible for the doubt now cast on the value of soil analysis. I will determine the

Chlorine, Alkali,
Total Soluble Salts,
Phosphoric Acid,
Potash, Lime, Magnesia,
Adequacy or Inadequacy
of Humas and Nitrates;

and these determinations will have reference to the materials now subject to the use of the plants. I will also give a mechanical analysis of the soil. This is all that is necessary to know for practical purposes and is much cheaper than a complete analysis. If the orchardists realized the profitableness of this information to them, everyone would want this work done at once.

Owens Valley Land
See Announcement on Page 16

The new section around Artemisa was visited, which is about fifty miles west of Havana. From this station will be shipped probably one-half the island pine crop during the coming season. There are some extensive pine fields at this point. The pineapples are large in size, mostly 18s and 24s.

From the facts ascertained from various growers the cost of producing a crate in Cuba, ready for shipment is about eighty-five cents, as against one dollar in Florida.

In conversing with large and small growers they claimed to have averaged from eighty-five cents to one dollar and ten cents the past season. The average price realized seemed to be one dollar. A great many were sold in the field at from fifteen to twenty-five cents per dozen, according to size, distance from the packing house and whether cut by owner or buyer, realizing about fifty cents per crate from such sales. The growers who did this feel like the fellow who sold for one dollar and a half f.o.b. in Florida. The best information seems to be that there will be no radical increase on the island output this coming year, but will be about the same as the past season—one million, three hundred thousand crates.

The trial shipments over the Florida East Coast Railroad the past season were very satisfactory and the percentage damaged greatly reduced, as they normally expect a ten or twenty-five per cent loss en route by steamer. The loss has been reduced to less than five per cent by the Florida East Coast route, and it looks like a very serious matter to Floridians already, much more so when the extension is completed and in operation.

The gentlemen are more firm in their belief than ever that equal rates are necessary with the Cuban grower in order to compete with them. By being given those rates there will still be money in the production of pines for the Florida grower.

The pine crop in Cuba is grown, packed and shipped by Cubans. Americans did not ship 30,000 crates the past season—prospects for not over 50,000 crates the coming season. For various reasons they cannot meet the Cuban competition there.

If the American grower in Cuba was all there was to fear, the Florida grower's prospects would be bright, but the Cuban understands his branch of trade.—Porto Rico Horticultural News.

THE PONDEROSA LEMON.

This truly ever-bearing variety produces lemons of remarkable size. The trees are strong and healthy, easily cultivated and enormously productive. They bloom and bear fruit when quite young. The flowers are pure white, with yellow stamens, and as fragrant as orange blossoms. The beautiful foliage is thick, glossy, and resists insect attacks admirably. A tree of this sort, covered with masses of flowers and large, handsome lemons is excellent for culinary purposes. Usefulness and beauty are combined in a high degree in this remarkable plant. So say the catalogues—especially of California—that are exploiting this lemon, which is all that is claimed for it except that relating to its culinary qualities. It is too large to come into general use. The writer has grown it for years and there is no demand for it in Florida. The good housewife takes the rough lemon or the regular lime in place of it, while scores of four-pound Ponderosas hang on the bushes until they rot and drop to the ground. In pots it is to be commended, but for general use it is useless.—Florida Fruit and Prod. News.

* * *

Possibly California nurserymen are "exploiting" this worthless lemon but we are not aware of it.

PROTECTION OF YOUNG CITRUS TREES FROM COLD.

The Agricultural Gazette of New South Wales in a back number describes an excellent method of protecting the young citrus trees from the cold. "To begin with, the branches are drawn together, and tied with binder twine, but not so tightly as to preclude a free circulation of air. A small trench is made around the base of the tree, in which are placed the butt-ends of sorghum or corn, the leaves being then spread loosely around the tree, not so closely, however, as to smother it. All that is required is just sufficient to protect it from frosts, and if covered too closely it might smother and kill the tree. Then tie about fifteen inches from the ground, and again near the top. It will be observed that a portion of the leaves can be seen through the covering; there is, however, little danger of this foliage being damaged, as the sorghum will protect it all right, and, as before stated, trees should not be covered too closely. After the sorghum is tied with the two ties a little earth is thrown around the base to assist in holding the covering in place."

In Florida it is usual to bank soil around the trees up to the first branches in order that enough of the tree will be left to bud upon, in case of a severe freeze that would kill the tree back to the ground.—Florida Agriculturist.

WILD FLOWERS IN ITALY.

The wild flowers abound, old friends from home and lovely relatives—a campanula almost as big as a Canterbury-bell, buttercups, pink yarrow, grape hyacinth, orchids, pink mourning-bride, wild monkshood and larkspur, thrift, forget-me-not, ladies' delights, marguerites, Queen Anne's lace, St. John's wort, tiny red lilies, a light pink clover with loose lovely heads, a yellow flower gone to seed in a frosty rosette the color of the mimosa bloom, white anemone, cow wheat, alpenrosen, edelweiss, pinks, thyme, cinquefoil, stonecrop, yellow vetch, marsh marigold, and saxifrage. And down toward Canazei, great slopes of firewood are burning in the sunset glow. And from the big veranda, where the dinner is spiced by the mystery of Hungarian goulash, you see over the cold mountains two rosy clouds in the green sky, and between the clouds a star. Canazei is clear and cold, sparkling under stars or sun. One morning you are ready for the diligence at seven, but before you can mount to your lawfully secured seats two elderly German men, each in a hooded cloak, dry-as-dust scholars, out of a play, scramble into them like hurried little animals, and settle themselves with an "Ach, so!" But they are invited to scramble out straightway, and sorrowfully do it.—Alice Brown, in Harper's Bazar.

AWARDS AT SEBASTOPOL.

THE selection of judges for the Gravenstein Apple Show was by unanimous consent left to State Horticultural Commissioner J. W. Jeffrey, who was an interested and enthusiastic visitor. He appointed Messrs. Whitney, Black and Maskew, who, after careful consideration made the following awards:

Feature Exhibits.

Locomotive, Huntley & Morse, first prize.

Pleasant Hill, dryer, second.

W. H. Baker, windmill, third.

Hotle Brothers, "Gold Ridge" orchard, fourth.

Forestville School House, fifth.

E. Moll, apple tree, sixth.

W. I. Newcomb, "Old Oaken Bucket," seventh.

Green Valley, depot, eighth.

Stony Point exhibit, ninth.

Boys' and Girls' Aid Society, tenth.

Analy Bank, eleventh.

Courthouse exhibit of Mrs. J. P. Kelly and Mrs. G. D. Sanborn, twelfth.

E. H. Smith's five pointed star, thirteenth.

V.ne Hill District, American and bear flag design, fourteenth.

Honorable mention—Mrs. M. R. Crystal and George A. Corley.

The exhibits of the two local banks were not entered for prizes, but both were awarded special diplomas.

Apple Exhibits.

Best apple exhibit from one tree—H. R. Harbine.

Best apple exhibit seven varieties, I. W. Turner, first; Mrs. L. E. Barlow, second; Kauffman & Arnold, third.

Best apple exhibit, five varieties, Forestville, first; Pleasant Hill, second; J. W. Turner, third.

Best apple exhibit, three varieties, W. N. Couch, first; J. W. Turner, second; Mrs. L. E. Barlow, third.

Best arranged boxes, not less than 10 boxes, W. H. Baker, first; A. O. Scammon, second; Y. Fugii, third.

Best display of apples in plates, Ida S. Hunt, first; Mrs. Turner, second; Mrs. H. Briggs, third; H. Ballard, fourth; Frei Brothers, fifth; S. A. Banks, sixth; Mrs. Barlow, seventh; G. C. Armsbee, E. H. Smith, eighth and ninth.

Best exhibit of apples in basket, Mrs. Ida S. Hunt, first.

Best exhibit from one district, Stony Point, first; Vine Hill, second; Forestville, third.

Juvenile section, M. T. Ross, first; W. H. Worth, second.

Best exhibit of horticultural and agricultural products of the farm, W. S. Liddell, first; Ben and Bell woodworth, second; Frei Brothers, third.

Best exhibit corn on stalk, Anton Francisco, first; P. W. Bussman, second; V. A. Dorward, third.

Apple packers' entries—Garcia-Maginin Company, first; Earl Fruit Company, second; Hunt, Hatch & Co., third.

Apple growers' entry, Ida S. Hunt, first; Vine Hill, second; Mrs. Cadwell, third; S. C. Morse, fourth; M. R. Crystal, fifth.

Best grain in sheaf, Knowles & Stark, first; Pleasant Hill, second; Frei Brothers, third.

Best display of potatoes, Carl Wilson, first; W. K. S. Liddell, second; I. T. Ward, third.

Best display of vegetables, W. S. Liddell, first; Mrs. L. E. Barlow, second; M. A. Pacheco, third.

Best display of pumpkins, Analy Bank, first; W. S. Diddell, second.

Best display of berries, Mrs. L. E. Barlow, first; Mrs. M. R. Crystal, second.

Best display of fruit in jars, jellies, Mrs. George Ross, first; Mrs. L. E. Barlow, second; H. Briggs, third; Mrs. Henschover, fourth.

Best display of cut flowers, first prize and recommendation for a gold medal, Thomas J. Butts; E. E. Smith, second.

Window display, George McFarlane, first; Mrs. M. A. Jackman, second: E. E. Moll, third; Stellings Grocery, fourth; Crawford & Son, fifth; Weeks & Robinson, sixth; W. H. Bailey, seventh.

Best display prunes and pears, W. S. Liddell, first; Mrs. Kate Walsh, second; Mrs. Cadwell, third .

Best arranged exhibit of pears, W. S. Liddell, first; Mrs. Turner and Mrs. Cadwell, second; Mrs. L. E. Barlow, third.

Canners' exhibit, Central California Fruit Canners' Association.

Dried fruit, evaporated apples, Y. Fugi, first; Pleasant Hill Orchard Company, second.

Luther Burbank's exhibit, complimentary gold medal.

Special prize offered by George P. McNear for the best individual exhibit, Mrs. Laura E. Barlow.

Apples in glass case, J. J. Alves.

Eight boxes of peaches and two of oranges, J. J. Alves.

Peaches in wire baskets, J. W. Turner; first and second prizes.

Eight boxes of peaches, A. R. Thomas.

Best individual packers, T. J. Jones.

Peaches, six boxes, P. H. Peterson.

Dried berries, Mrs. L. E. Barlow.

Peas, Mrs. J. R. Rosie.

Turnips, D. F. Hampton.

Eggs, Sonoma County Fruit and Produce Company.

Condensed milk, H. M. le Baron.

Tobacco plant, W. E. Collins.

Big blackberry, Mrs. M. R. Crystal.

—H. W. K.

Sebastopol, August 14, 1910.

It is claimed the Texas peach crop this year will amount to between 1,500 and 2,000 carloads.

THE GRAVENSTEIN APPLE.

This is an apple of good size, attractive appearance and excellent quality. For culinary purposes it is perhaps unexcelled by any variety of its season. It often sells at comparatively high prices. It comes into bearing moderately early, is productive and a reliable cropper. The crop ripens during a period of several weeks hence should have several pickings. Beginning about the middle of August in Northern California it continues in season till late October. When properly handled a considerable portion of the fruit may remain apparently sound much later than this but the color fades and the quality and flavor are apt to deteriorate. As compared with other varieties of its class it stands up well in good dry cold storage and is a splendid shipper. Its cultivation in commercial orchards is increasing in northern sections of the state, particularly in Sonoma county, where fruit growers find it a desirable apple for both domestic and foreign markets.

THE EVER POPULAR "GRAVENSTEIN" APPLE.

WORTHLESS FERTILIZERS.

MY attention has from time to time been drawn to articles in papers and periodicals and to advertising literature, concerning the alleged value of various naturally occurring rocks and mineral deposits as fertilizers. Such of these as I have been able to investigate have been found totally without merit; and investors either in the material or in the stock of companies designed to exploit the deposits, run grave risk of financial loss.

It should be pointed out in the first place that few materials of this kind have any agricultural value, until they have been refined as in the case of nitrate or potash deposits, or so treated as to convert comparatively inert constituents into a form that will admit of their being taken up by plants, as in the case of phosphate rocks. At the present time the raw material for the manufacture of nitrate of soda is found in Chile; Germany, furnishes the potash deposits; and the phosphate rocks suitable for manufacture are found in Northern Africa, the Southeastern States and in a section comprising the southwestern part of Wyoming, the southeastern part of Idaho and northern Utah. Up to the present no local deposits of any of these materials have been extensively utilized for manufacturing purposes. And so far as I am aware, no such local deposits of sufficiently high grade have been developed to enter into competition with those from the above mentioned sources.

The idea has frequently been advanced that certain common rocks, notably those containing potash feldspar, should be of value as fertilizer because of their content of potash. When we consider the relatively stable and inert character of the complex silicates and the further fact that these are already present in large quantities in natural soils, it is difficult to see how applications of such materials would result in any immediate or important crop increase.

The well known fact that lava rocks have frequently broken up into fertile soils within a very limited period is used as an argument to prove that lavas should make a good fertilizer. This, however, does not follow. A mineral fertilizer to be worth the cost of application should contain relatively large amounts of one or more of the so-called "plant foods" in a comparatively easily soluble condition. To furnish an amount of actual potash equivalent to that in an ordinary application of sulfate of potash would require a relatively enormous quantity of ground lava of average composition. In addition the condition in which potash, the essential constituent, is combined with the other rock constituents is such as to justify little hope of its being utilized by plants within a reasonable period of time. Potash insoluble in water, as it occurs in such materials has no standing among reputable agriculturists nor under the laws of the several states.

Exploiters of worthless materials seem to have two methods of working; one is by the use of testimonials from real or fictitious persons who are supposed to have used the substances with advantage, the other is by the quotation of chemical analysis. The first is subject to all the abuses of a patent medicine testimonial and in the second case the uninformed investor is awed by an array of figures which he does not understand and cannot interpret. Furthermore the layman is apt to be impresse by the reputation of the chemist wh made the analysis. This is a grav error because reputable chemists fre quently make analyses of samples o material, the source of which is un known to them. It is, accordingly easy to quote a correct analysis of high grade sample as applying to lot of goods or deposits which they d not represent. Even well intentione persons in taking samples tend select the best specimens and fail realize that these may not represen the deposit as a whole.

The purchaser of materials inten ed for use as fertilizer should u derstand that the sale of fertilize in California is regulated by law and licensed by the state. All legitimate fertilizer manufacturers and dealers, handling goods not licensed by others ,are registered with the Fertilizer Control of the University of California. For their own protection consumers should see that all goods purchased by them bear the name and registry number of the manufacturer. Attempts to sell unregistered and possibly worthless materials should be reported to the Fertilizer Control.

The prospective purchaser of stock in companies designed to work mineral deposits should bear in mind that with the exception of high grade gypsum, there are few naturally occurring minerals which can be profitably applied directly to the soil as fertilizers even when finely ground. The manufacture of fertilizers is a complex business, requiring technical skill and for most classes of goods considerable capital. No person should buy stock of such companies unless he is absolutely sure of the skill and integrity of the promoters and has expert advice as to the suitability of the proposed raw material as a constituent of fertilizers.—John S. Burd, Chemist in Charge, Fertilizer Control, University of California.

APRICOT DRYING IN TULARE COUNTY.

APPLE PRODUCTION.

We recently conversed with a well-meaning gentleman who criticised us for advocating the planting of more apple orchards, using the argument that farmers cannot sell the apples they are now raising, says the Mirror and Farmer. We do not care to go into the question of why farmers are unable to sell their apples, as we believe every well informed person knows that the fault is not in the market, but in the method of growing and offering the fruit for sale. We are more concerned with the question of whether or not there is much danger of overstocking the market with first quality apples, the only grade of apples that claims the serious attention of the market.

It will, doubtless, surprise a great many people to learn that the production of apples of all kinds, good, bad and indifferent, has greatly diminished during the past few years. Production has decreased while at the same time the population has increased. For the five-year period, 1900-1904, the average annual production was 43,680,200 barrels. The period 1905-1909 the annual production declined to 27,480,000 barrels, a net decrease over the former corresponding five-year period of 16,272,200 barrels, or 37 pér cent. This does not prove that apple eating has become unpopular. In fact, we need only to cite figures compiled from the export trade to prove that prices have increased rather than decreased. For instance, the average export price per barrel for apples in 1903-1905 was $2.46, while for the following three-year period, 1906-1908, the average price was $3.18 per barrel. It would appear from the above that the increased demand of the home market has advanced the price of the export trade. Certainly the foreign market would have no occasion to pay more for American apples than apples were bringing in the home market. The falling off in production has had a decided effect upon the volume of our exports. In 1908 our apple export was 968,717 barrels less than in 1904, the year that marked the maximum trade in apples shipped to foreign ports.

In view of these figures it is evident that we shall need to increase our apple production more than 16,000,000 barrels in order to bring it back to tne point reached in 1904, and this without taking into consideration the increase of population during the past six years. We are unable to give figures covering the item of increase in population, as the census returns have not been compiled, but it is safe to assume that our population, at least calculation, is increasing at the rate of two millions a year and in all probability in excess of that.

The statistics of apple production do not make a distinction in favor of first-class apples. The figures covering production include all grades of apples; hence, as the era of scientific culture is yet in its infancy, there will need to be an enormous increase in the production of first-class apples before the supply will equal the demand. Old, neglected, pest-infested trees are going down in legions, which will make room for extensive practice of scientific culture without seriously impairing the present demand. Also, it must be borne in mind that a commercial apple orchard requires ten years to come into bearing, and in the meantime there will be from twenty to thirty million more people to consume apples at the end of that period.

In our opinion the time is favorable for the extensive planting of apples, because there are no indications in sight that the market will be overstocked for years to come. One need only study the figures covering present production and export to convince himself that we are a long way short of supplying present demands, let alone the demands of an ever-increasing population.

BUDDING PEACH TREES.

Budding can be used to propagate plums, cherries, apples and pears, but it is used most commonly with peaches. The operation is very simple and is easily performed.

If a man wished to start an orchard of budded peach trees, he would plant seeds of any strain which is hardy in his locality. Near the end of either the first or second season's growth he would bud them. Peaches are usually big enough to bud during the first season of their growth, while with cherries, plums, apples, and pears, it is better to wait for the second season.

Budding is simply a form of grafting, only it is done usually during July and August instead of in the spring. From the middle of August to the first of September is a good time to bud peach trees. During late summer the bark is loose and it is easy to separate it from the wood and insert the bud.

Buds are got from good, healthy trees of the variety desired. What are known as bud sticks are cut from healthy wood of this year's growth. The buds with bark attached are cut off this stick in the shape of a shield; it is a good plan to leave the petiole of each leaf attached to protect the bud and to act as a handle. A T cut is now made in the bark of the stock on the north side, two or three inches above the ground. The flaps of bark are separated from the wood, the bud is pushed in, and the flaps are bound together with raffia over the edges of the bud.

Late in the season the raffia should be loosened to avoid girdling the tree and the stock should be cut off an inch or two above the bud. The next spring all buds other than the one inserted must be rubbed off. With all nourishment thus directed to it, the inserted bud makes a very rapid growth.—Wallace's Farmer.

It is a good and safe plan to sojourn in every place as if you meant to spend your life there, never omitting an opportunity of doing a kindness, or speaking a true word, or making a friend.—John Ruskin.

Strong, Vigorous and Thrifty Walnut Trees

Well grown, true to name, and ready for immediate planting; of the New and Popular Variety, the

Placentia Perfection Walnut

A prolific and regular bearer of large, meaty, fine-flavored nuts, commanding from 2½c to 5c per pound more than the ordinary soft shells.

Choice trees, 3 to 14 feet, from 20c each and up; special low prices on lots of 200 and over. If contemplating planting a walnut grove, it will be to your interest to correspond with us at once, as the stock is limited and the price sufficiently attractive to clean it out quick.

DON'T WORRY ABOUT FROST

Our successful demonstration at Pomona on July 14, 1910, convinced all the growers that our ORCHARD HEATER will do the work of protection perfectly. Our heaters at the Pomona demonstration burned 7 hours 15 minutes and raised the temperature 9 degrees. A heavy wind was blowing at the time, a condition you don't have when you have frost.

It Was Our Heater that Saved the Crops in Colorado

We Were the First to Make Orchard Heaters We Are the Pioneers

We will demonstrate in competition with any other heater in the world

OUR HEATERS PRODUCE NO SOOT.

We will guarantee our heaters to be the cheapest to burn and cost only 20 cents each. Five quarts of oil in our heater will burn from 6 to 8 hours.

ORDERS FOR OUR HEATERS MUST BE HAD IMMEDIATELY OR WE CAN NOT GUARANTEE DELIVERY

We will gladly demonstrate our heater at any time and for anybody that needs them. We are the only Orchard Heater concern that will give the grower a practical demonstration and furthermore we will demonstrate against any other heater to show that our heater is the BEST.

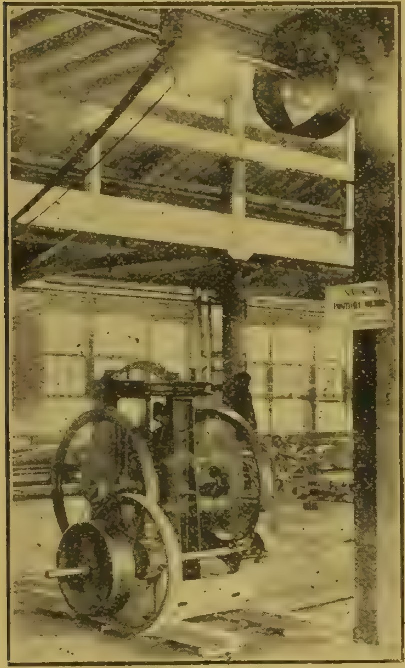
The Luitwieler Non-Pulsating Pumping System



Best For Deep Well and Irrigation Work

Pump Talk Continued:

The cam principle is now universally conceded to be the most perfect mechanism for lifting water from deep wells or against pressure. Luitwieler Pumps are the result of long years of experience and embody the perfection of the cam principle. The mechanism is balanced and all pumps are tested for smoothness of operation before leaving the factory.

The cut shown here is that of one of our 18 inch Double Geared Pumps, being driven by only a ½ inch belt lace. The weight of the revolving parts is 3200 pounds. This test is not possible with any other type of pressure pumping mechanism, not even the much advertised Triplex.

Luitwieler Pumps are in a class by themselves. 32 years of experience in Los Angeles with pumps and irrigation. Send for our catalogue.

The Tee Irrigating Valve

Simple in design and construction, costs less and will last longer than any other on the market.
The Tee Irrigating Valve is made of an ordinary malleable iron T with a brass plug. It is designed for those who want an inexpensive irrigating valve, especially where such valves are needed in large quantities. There is nothing to get out of order. It is so simple you will wonder why it was never thought of before.
A ½-inch valve sent post paid upon receipt of 40 cents. Quantity price, circular and full information upon request.
Address **George C. Roeding, Fresno, California**

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

TESTING THE HOME HERD.

By Mrs. Minna E. Sherman.

After finishing the testing of the herd on the other ranch we turned heartsick when we looked over the registered herd at the home ranch. We began by testing them as fast as we could and within a month had them finished. This was possible because the cows were bred to come in during the fall, and those that had freshened could be tested at once and the others came in two, three or four daily. The herd has been tested eleven times now and we feel sure that it is free from disease.

1896—208 head tested, seven condemned. 1897—231 head tested, four condemned all heifers with first calf. 1898—219 head tested, two condemned, a heifer and a yearling bull. 1899—219 head tested, none condemned. 1901—entire herd tested, none condemned. 1902—none condemned. 1903—entire herd tested, none condemned. 1904-1905-1907-1909—all the herd tested and none reacted. Surely this was cleaning up a herd from tuberculosis completely.

Sanitary Improvements.

Now I cannot believe that tuberculin has played the mischief in the herds that is claimed in article quoted Aug. 4th. Encysted tubercles in the human family lie dormant for years and then once in a while come out into active life. There is always that danger of their taking on activity when the body is weakened. Human beings can guard themselves while cows cannot and I would not care to risk having a cow that might be throwing off the bacilli in the herd. I would rather throw her away at once. A registered herd costs too much money to risk anything like this occurring. Then too, a breeder's herd must be like Ceasar's wife, above suspicion. I think we have cleaned up a herd from tuberculosis and I know others believe that they have done the same. I wish I had power to make every one feel the necessity of doing this.

Reinfection.

These cases confidently quoted, I should regard as reinfection. This reinfection we guarded against most carefully by building a new barn on clean land that had had a wine grape vineyard removed from it. The old cow barn was used for colts and mares. The old pasture was plowed up and new, clean land sown to alfalfa for the cows. Then the manure was taken away every day and spread on orchards or vineyards. Manure from tubercular cows has been found to carry a large number of active bacilli, and while I think under the sun of a California summer day they would probably be destroyed, back in the East with moist heat this destruction might not be complete.

Spreading Manure.

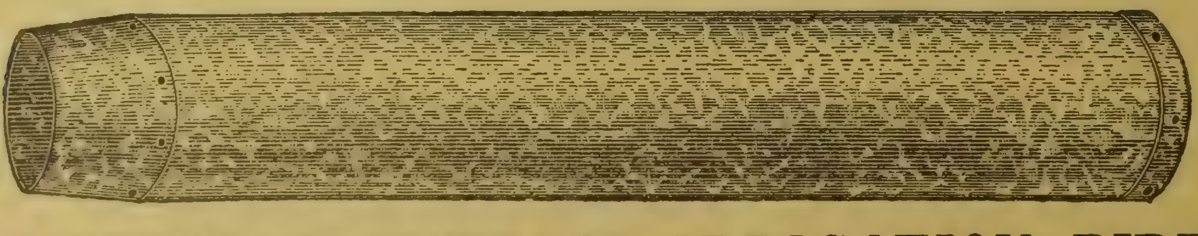
In the Orange Judd Farmer of July 23, 1910, the following paragraph appears: "Another very common error is that land is made more fertile by being pastured. Those who have studied the subject tell us that fertility of the land is increased only when concentrated weeds are fed or when top dressed with stable manure. In my own experience no investment in farm machinery has been more thoroughly satisfactory than for a manure spreader, and nowhere have the results been as immediate and as great as when it has been used on pasture land. The first rain washes it down and the cattle soon graze where the new growth has been stimulated." Now I would think some bacilli might readily escape destruction under these conditions.

Stables.

Where tubercular animals have been housed the disinfecting must be very thorough. The entire woodwork should be hand scrubbed with hot lye water and when dry, soaked with corrosive sublimate water. Over this can go the whitewash. The floors, if of boards, after being made as clean as possible, should be swabbed off with carbolized water and then soaked with crude oil thinned with engine distillate to make it absorb. The water troughs and the fences may be treated in the same way. If the buildings cannot be of cement or stone construction that can be readily cleansed, it would be better instead of expensive wooden buildings, to make the cow stables as cheap as possible and destroy them when disease breaks out.

Human Family.

The infecting of new subjects has been closely worked out in the human family and can be used as an instructive lesson for the dairyman. In New York City slums the houses that have deaths from tuberculosis have been mapped for several years. It was found that certain houses were infection centers, certain to have new cases and deaths every year among the families moving into them. No matter what the race or the previous history of these new victims, they succumbed all the same. The next house might be older and poorer from a general sanitary point of plumbing and yet be free from tuberculosis. Then modern science took hold of the matter and these houses that were white plague centers, were stripped of their plastering completely—the woodwork was disinfected and modern hard finish took



AMERICAN SURFACE IRRIGATION PIPE

SAVES WATER, GRADING AND TIME

The only scientifically constructed ***Surface Irrigation Pipe*** on the market. No round seams to leak, retard the flow of the water, or weaken the pipe. Cheaper than flumes. Easily handled. ***Will last a lifetime. The correct way to irrigate alfalfa.*** We make Riveted Water Pipe and Tanks. ***Write for illustrated catalogue.***

349 Pacific Electric Building **Los Angeles, California**

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.

the place of the former soft plaster walls. These houses passed off the black lists at once. Fresh air, and sanitary cleanliness, have resulted in lessening the deaths in the human family, and it can be made to stamp out the trouble in the dairy. The flies that have bred in the manure for so many years and carried the bacteria of disease to food will soon be a thing of the past. I, therefore, am so far a believer in the use of tuberculin. Even if it proves true that it starts up encysted tubercles in the cows, well and good—let us get rid of them all as quickly as possible. One human life is worth a stable full of cows.—M. E. Sherman.

STATE DAIRY BUREAU.

Replying to a request of Watson's Western Creamery for a statement of the work of the State Dairy Bureau Secretary F. W. Andreason gives outline of work done.

Owing to the fact that the appropriation was cut down for two years to the small sum of $5000 a year the work of the bureau came nearly to a standstill, formerly, and one or two inspectors could only be employed now and then and many dairies could not be inspected.

In the year from July 1, 1907, to June 30, 1908, 283 dairies were visited and rated. In the next year from July 1, 1908, to June 30, 1909, 483 dairies were inspected and rated.

The last legislature increased the appropriation to $12,500 a year and since then we have had a large force of inspectors who have worked hard. Their work has been principally devoted to bettering the sanitary conditions of the dairies and in this last year the inspectors have visited and rated 4887 dairies and creameries.

The result has been that conditions have been very much improved all over the state and a great number of good dairy buildings have been built.

We have, where no other course would avail, prosecuted over forty dairymen for maintaining unsanitary dairies and have obtained convictions in all cases but one.

Some time has been devoted to enforcing the law prohibiting the adulteration of milk, and the use of preservatives in dairy products, and we have during the year analyzed in the Bureau's laboratory, 522 samples of milk, butter, cream and cheese. Fourteen prosecutions have been brought against parties selling adulterated milk. In one case the jury disagreed, and two cases have not yet been decided by the court.

Since December 20, 1909, all samples of milk showing a low specific gravity by the use of lactometer, have also been dried out by the official method of analysis to make sure that the per cent of total solids was low.

During the year ending June 30, 1910, we have calibrated and certified to the correctness of over 2500 pieces of testing apparatus.

We have considerable difficulty in retaining the inspectors that we get started at the work.

In August, 1909, Mr. J. P. Murphy accepted a position as inspector for the Bureau. In the three months that he held that position, he accomplished so much in the way of improving the conditions among the dairies in Fresno and Tulare counties that it created great enthusiasm among the dairymen of Tulare. They became inspired to build something grand and after forming a "co-operaative company" they offered Mr. Murphy double the salary that we could pay, if he would attend to the construction and become manager of the creamery. They are now operating one of the finest creameries in the state.

A few months later one of the largest creamery companies in the state saw that one of our inspectors, Mr. J. H. Severin, was a man of great ability, experience and energy, so they offered him nearly double the salary he was getting from us. He joined them but in a few days another concern offered him still better pay if he would attend to the building of their fine creamery at Modesto and become manager of the same.

Now the dairymen of Riverdale, Fresno county, have found that our inspector, Mr. C. A. Starkweather, has accomplished a great amount of good work in the district during the three and one-half months he has worked among them as inspector for the Bureau. They decided that they would build a fine creamery, and though there were other good men anxious to get a position as manager of their creamery, they decided that Mr. Starkweather was the right and only man, and of course they nabbed him.

While it is gratifying to note that the dairymen have taken so kindly to the severe criticism often made and drastic measures resorted to by these inspectors to get the desired results it is on the other hand annoying to have them always taking our inspectors from us, and we do not know how long we can keep it up, and furnish managers for their new creameries.

SUCCULENCE FOR THE COWS.

Nothing is more sure than that after the cows have been out on the pasture a few months, the grass will begin to fail. Experience teaches us this beyond a possibility of doubt, though the failure may be delayed somewhat by rain and favorable climatic conditions.

But one result can follow this state of affairs. The milk yield will drop off materially unless we resort to some method of supplying the green feed the cows must have to enable them to hold up in their flow. No juicy food, no milk.

He is a wise man who foresees this time of dead, dry pastures and makes his plans to tide it over. Our summer seasons teach just that one lesson—we must depend upon grain or green crops for our milk flow after the pastures begin to fail, or we will surely suffer loss.

Here comes in the value of the silo. The man who has a silo well filled with corn or some other form of ensilage may laugh at the midsummer drouth. He will gather in the checks while the man who is not thus equipped will be compelled to suffer loss. The modern silos will keep ensilage perfectly for summer feeding. When the grass falls off, then open the silo and give the cows some every day. That maintains the milk flow and brings in the checks, without which no farmer can succeed.

But not all as yet have silos. What then? Then the reliance must be on fresh-cut green feed. It is not too early to make preparations for this. Whatever crop may be used for soiling, this is the time to arrange for it.

On our own farm we have had good luck with oats and peas sowed together. One-third common field peas to two-thirds oats is the proportion we use. The first sowing is made about the time we finish sowing oats for grain. Then a couple of weeks later another sowing may be made. The land for this purpose ought to be rather near the barn, so that it would be comparatively easy to slip out and cut a load for the cows. By the time the first sowing is gone, the other would be far enough advanced to begin on. Still a third sowing might be made for later feeding.

And then, sweet corn makes a fine feed for this purpose. The seed costs a little more than that of common corn, but I think it is worth enough more to pay for the difference in cost. This I would plant, not sow thick. Planted with plenty of room between the hills a good deal of ear corn may be grown on the stalks. This increases the feeding value very much. As soon as the oats and peas are gone the corn comes in to meet the demand, and this may be the plan all through the fall. It or some other plan must be adopted or we will surely be doing business at a loss on a very narrow margin.—E. L. Vincent, in Des Moines Homestead.

HOLSTEIN-FRIESIAN ANNUAL.

The Holstein-Friesian Association of America has sent out a report of its recent annual meeting held at Syracuse in June. The report contains a list of members of the association, prize winners during the year 1909-1910, and a condensed report of the annual meeting. Amongst the statistics given we note that the registered certificates number during the year 26,176, much greater than any other dairy breed. California leads in proportionate increase of membership during the year. The association starts in the new year with a balance on hand of nearly $40,000. Fred'k L. Houghton, Brattleboro, Vt., is secretary of the association.

Horses have good memories and good treatment will not be forgotten.

Sound as a Dollar

That's the way to keep your horses. It's easy to do it with Kendall's Spavin Cure. Thousands of other horsemen have done it in past 40 years.

Cured Spavin

"Two years ago, I bought a pair of fine black mares. In about six months one had a Spavin. I simply used your Spavin Cure, and cured her entirely, which mystified all the horsemen.
Yours truly,
M. S. Culver, Union City, Conn."

Letters like the above are received by us daily from grateful horsemen.

Kendall's Spavin Cure

is the only safe, sure cure for Spavin, Curb, Splint, Ringbone, Bony Growths and all Lameness. Save your horses with the old reliable cure. Leaves no white hairs or scars. It is the world's best liniment for man and beast. At druggists, $1 a Bottle; 6 for $5. Ask your druggist for book, "Treatise on the Horse," or write to

Dr. B. J. Kendall Co., Enosburg Falls, Vt.

Cream Separators, all sizes and prices. O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.

No Hoof, No Horse

U. S. statistics show that 80 per cent of all horses are lame and that 80 per cent of the lameness is caused by hard and contracted feet. As a hoof softener, toughener, nourisher and grower there is nothing equal to

Eshelman's Wool Fat Hoof Healer

A horse's hoof is from 60 to 70 per cent water. Grease and water will not mix. There is no grease about Wool Fat. It mixes readily with water, is very penetrating, and while a great medicine of itself, it also acts as a vehicle to carry to the afflicted parts the other medicinal properties of the HEALER. It is absorbed into the skin and gives natural stimulation and nourishment to the hoof. There is nothing that can compare with it for this purpose, nor as a remedy for contracted hoofs, split hoofs, quarter cracks, mud fever, corns, grease heels, and for all kinds of sores and cuts anywhere on any stock. If you have tried it, you know that this is true. If you have never tried it, it will surprise you with its power as a healer and restorer. It is not a new remedy, but has been on the market in the East for many years, where it has given the greatest satisfaction.

4 oz. package, 25c; 12 oz., 50c; 32 oz., $1.00; 5 lb. pail, $2.00; 10 lb. pail, $3.50. It is easy of application. Directions with each package.

TRIAL OFFER.

We will send you a 2-lb. can, use it 15 days, and if satisfactory, send us $1.00. If not, write us to that effect, and you need pay nothing. We take all the risk, you just try it. Send for it today.

General Agriculture

THE PARCELS POST.

THE parcels post movement of course will meet the very powerful opposition which the express companies themselves and their allies, the railroads, can bring to bear to defeat or check and postpone its success.

To meet this a vigorous propaganda should be sustained. Primarily the movement interests and will benefit the farmer, and farmers' organizations are doing excellent work to arouse sentiment and focus influence. The Farmers' National Congress is publishing leaflets effectively presenting the arguments for the parcels post. A very timely one touches the question of the postal deficit, to which President Taft called such conspicuous attention.

The official reports of the Postmaster General, according to the leaflet, show that the average weight of mail delivered by each team or single horse wagon in the rural delivery service is only twenty-five pounds. Yet each carrier could as well carry ten times that weight. "There are more than 40,000 rural routes. Hence the carriers on these routes make more than 12,480,000 round trips each year. If a parcels post on the rural routes earned $2 for each round trip, the gain would be, in round numbers, $25,000,000 per year; and this, with some little reforms that all agree should and could be easily made, would wipe out the postal deficit. Now, taking the minimum rate proposed on the pound packages in a rural route parcels post—5 cents a pound—the carrier, to earn the $2 per trip, would be compelled to carry, not the 500 pounds that he could, but only 20 pounds additional going and coming, or a total load of only 45 pounds."

Four million families already are served by the rural deliveries and more will be served each year. Yet though the carrier passes every week day each of the 100 farmers he serves, if he wishes a package from the town, he must hitch up and go or send for it. The economic waste of this is obvious, especially in view of the fact that the carrier is now traveling with much less than he can convey.

The opponents of the parcels post are rallying the small town merchants to their aid on the argument that the post will injure him to the advantage of the great city mail order houses—a fallacious theory which is only used for political purposes. The village merchant will benefit more than he loses. This view the supporters of the post express in this way:

The bills for parcels post, confining the service to packages originating on the rural routes or in the postoffice towns serving these routes, are so drawn that this limited parcels post could not possibly aid the city mail order houses and they are all very earnestly fighting it. And it would certainly benefit the local merchants, for it would make trading with them by the rural people so convenient. The local merchants are really injuring themselves by opposing the limited, rural route parcels post; for as the farmer is now compelled to go to the village railway station to deliver or to receive packages, he very frequently takes the train there and goes to the larger town or city to buy the goods he needs. The two cents a mile railway fare prevailing in many states tempts him all the more to do this. Any close observer in the Western states where mail order trading is perhaps greatest, knows that what takes most from the trade of the local merchants is not the mail order houses—in all the United States there are only two of them markedly successful—but the low railroad fare that tempts the farmer and his family, compelled by the lack of parcels post to come to the railway station, to go on to the larger stores and possibly better prices of the large town or city. If we had a modern parcels post, often making it unnecessary for the farmer to come to the railway station, the local merchants, receiving orders from the farmers by telephone, would send out by the rural carriers millions of merchandise now bought in the large towns.

Every legitimate device that brings farm life toward the same level of convenience as city or town life is of the utmost importance to the nation. The trend of population toward the cities is not to be encouraged if the nation is to continue powerful and prosperous. The parcels post deserves the support not only of all farmers, but of city people as well, and its passage will help them both.

ALFALFA WORMS.

The alfalfa worm pest in the Imperial Valley is becoming so serious a menace that a representative of the Dept. of Agriculture, Mr. Wildermuth, is in the field investigating. Mr. Packard of the State Experiment Station staff is also in the field and these gentlemen make the following preliminary report:

"The damage done by the larvae of the yellow butterfly to the alfalfa has become so serious that it was thought best to give certain tentative results regarding the control of the pest, which have been reached so far in the investigations started this spring by both the State Experiment Station and the U. S. Dept. of Agriculture. Since the investigations looking toward the control of the butterfly have not yet gone over a single season, absolutely conclusive results can not be given. The suggestions offered, therefore, should be considered only as a probable means of handling the problem.

"The alfalfa butterfly (Colias eurytheme) is the cause of so much damage in this section of the country, because the growing period of the alfalfa extends over such a great length of time and because the winter season is so mild. The butterfly hibernates in the pupal stage during the winter months and, at the beginning of spring, those that have survived the unfavorable conditions and the attacks of their natural enemies issue as butterflies and begin to lay a large number of minute, oblong, whitish eggs on the leaves of the alfalfa. These soon hatch and later appear as the destructive green

Owens Valley Land
See Announcement on Page 163

worms, which rest on the stems of the alfalfa and feed on the leaves. In due time they pass through the regular life history and emerge as butterflies. At the present time the third brood is doing the damage to the alfalfa.

"It seems that a large proportion of the worms can be killed by cutting the second crop earlier than is the common practice throughout the valley; but since time for such action has passed, the best thing that can be done is to cut the present or future crops as soon as the worms appear in the fields, and thus not only save some of the crop affected but also prevent the majority of these worms from maturing and laying more eggs for the next brood. Many worms are shaken off in the windrow or the hay cock during the process of making hay, but a large per cent of them die of starvation, as the new growth does not come on in time to give them sufficient nourishment. The degree of success obtained by these means will depend materially on thorough and clean cutting. The shorter the hay is cut and the less green alfalfa left on the borders, ditch banks and turning rows, the less opportunity there will be for the worms to tide over this period. By irrigating with a big head of water immediately after removing the hay many will be drowned. Of course care should be taken in this case not to scald out the alfalfa. Exactly opposite to this method is one in which the field is allowed to go dry for a week or so after cutting, thus insuring the starvation of all larvae present. A number of farmers have inaugurated the practice of allowing their fields to go dry during August, claiming that they thus secure better crops the following fall. If all of the farmers of the valley would do this, the probabilities are that the crop of worms for next year would be reduced. Even if the farmers of a single locality should follow the suggestions given here, the serious conditions which now exist would be alleviated, but the comparative success depends upon the co-operation of all of the alfalfa growers of the valley.

"A certain parasite, natural to the valley, has been found in many of the fields attacking the worms, but so far has not been present in sufficient numbers to be of any great economical importance. In dealing with any fields such as this, spraying or other similar methods of procedure are manifestly impossible."

In order to be able to collect as much data as possible and to reach final results, either of the agents located in El Centro will be glad to cooperate as far as possible in helping any farmer to carry out the suggestions given or to assist him in any plans that he may have to offer. Information or other inquiries should be sent to the State Experiment Station Agent, or to the U. S. Government Entomologist, both located at El Centro.

THE OLD GROUCH!

Hawks—If a fellow marries a dairy-maid, do you think he will be creammated?

Bawks—No, he'll be married.

"Don't you think, Mary, you are too old to play with the boys?"

"No, mamma, the older I get the better I like them."—"Judge."

POISONING SQUIRRELS.

The Porterville Messenger referring to a method of poisoning squirrels followed by a rancher says:

A large number of shallow cans were procured, made by cutting condensed milk cans in half. These were filled with water and were scattered along the east side of the nursery, at a distance of about thirty feet apart. Nothing but clean water was put in them for several days. When a can was overturned or carried away, it was carefully replaced and again filled with water.

It was but a short time until the tracks in the dust indicated that the squirrels of half the countryside were coming to the Davidson nursery to get their "mawnin's mawning." Mr. Davidson procured from the drug store a strong solution of strychnine, acetic acid being used in the proper amount to hold the poison in solution.

Then the cans were emptied of the water and one evening were filled with the solution. The next morning, near the row of cans on the side of the nursery there were seventy-five dead squirrels. The men employed by Mr. Davidson were working in a hay field alongside the nursery on the day following the use of the poison and it is stated that no less than three hundred dead squirrels were found as a result of the one day treatment. Since that time the scheme has been kept in use constantly and has been an ample protection to the young trees of the nursery.

We have copy of a book entitled "Where Our Wealth Lies," made up largely of statistics showing imports and exports of Mexico. Especially does it call attention to the fact that the "United States ought to be our tributary in the importation of tropical fruits." The book states that it is a matter of surprise that Mexico, although in such immediate proximity to the United States, has not yet apprehended the immense riches and possibilities of development along semi-tropical and tropical lines of production. The author of the book is Bernardo Mallen, 3 Gabino Barreda No. 47, City of Mexico.

WORK.

Boggs—I was surprised to hear that Smith had failed. He always seemed to be very busy in his office?

Woggs—Yes; he spent more time tacking up those inspiring wall-mottoes than any other man I ever saw.

Der man mit plenty of money has friends to burn, und ven he goes proke he is sorry he burned dem.

"According to this paper," observed Mr. Goodwin, "an Ohio man has lived a year on beer alone."

"Well, that's as it should be," rejoined Mrs. Goodwin. "Any man who lives on beer ought to be compelled to live alone."—Chicago "News."

"One of the best signs of a well-balanced mind is that of cheerfulness. It means a healthful outlook on life."

"Politeness is like an air cushion there may be nothing in it, but it eases the jolts wonderfully."

There are various and several kinds of undesirable trusts, but trusting to luck is the extreme limit.

For Work or Play

The backbone of our business is the manufacturing of Tents, Awnings, Irrigation Hose, and of heavy canvas construction in general. However, we serve the public in many ways: We supply you with hunting, fishing and camping goods, with outing apparel, storm clothing, sweaters, bathing suits, with flags, bicycles and kodaks.

PRODUCE MARKETS.—Los Angeles Market, San Francisco Market, Deciduous Market; Citrus Market: 166, 167.

Co-Operation Succeeding.

It is gratifying to note the success that is coming to the apricot growers who formed the Dried Fruit Association. We have word from Mr. Berneike, one of the members, that Santa Ana growers shipped last week four cars of dried apricots for which 10 cents per pound was paid. Other members are now holding for 11 and even as high as 12½ cents. Affiliated with the Orange county association are a number of Ventura county producers. It is to be hoped that this organization will prove its worth to the extent that another year a much larger membership may be atracted to it. The individual grower is entirely at the mercy of the buyer unless he unites with his fellow producers.

The directors of the association are already planning for another year's work and the 100 members now selling through the association should be increased many fold before the fruit cutting season begins again.

The Universal Fruit.

It is quite safe to say that no orchard fruit is more extensively grown over the earth's surface than the apple; nor is there another fruit that so widely nourishes mankind, nor one that allows of so many uses in different forms. It is indeed a staple in domestic economy. Allowing for these facts, it is indeed surprising that it has not commanded wider attention in this state. We have had our citrus fairs, raisin and orange days, for lo, these many years; but it has been only within the present year that the California apple has come into possession of its own as a public attraction. However, it has set a rapid pace, and in the vernacular of the street is now "going some." In another portion of this week's Cultivator we give a report of the Gravenstein Apple Show held last week at Sebastopol,—really a magnificent effort, and one that is destined to call attention to that superb region as an apple-growing country.

But there are other and many sections of California calculated to produce as fine a fruit as the far famed gardens of the Hesperides. On the northern coast, along the foothill regions of the San Joaquin, in portions of the higher elevations of the Sierra Madre range, clear down into San Diego, are many sections producing apples which for eating and shipping quality are royal in a land beyond any man's measure. The mountain regions grow the red sorts in perfection; the coast valleys, like the Pajaro, are celebrated for the light colored varieties such as the Bellflower, Newton Pippin, and the Gravenstein.

It is not generally known that California is a heavy exporter of this fruit. If our statistical knowledge is not in error, the Watsonville region last year shipped something like 3500 carloads; the output from Sonoma county was not so heavy, nevertheless it was no small item. Much of this goes to Europe and the Orient at certain seasons of the year. Commercially, the apple crop is destined to rank with the orange in this state; speed the day when it shall take equal rank.

In the meantime, remember the big Watsonville Apple Show. The dates are Oct. 10-15. If you cannot be present watch the Cultivator; it will give full and detailed reports of the event.

Chul Wheat.

The University of California has been experimenting for several years with a large number of wheats on the University Farm at Davis; also at the Tulare and other stations. The idea has been to find a new variety or varieties suitable to the climate and soil conditions of different parts of the state. The one found to possess greatest merit is chul wheat, which carries No. 598. This is especially adapted to Sacramento Valley conditions. It has excellent milling qualities and has borne good crops. This last season the University distributed over 161,000 pounds of seed to different growers, and from many of these have come statements that they secured from seven to sixteen sacks per acre. Regarding this wheat Prof. Snaw of the State University says:

"Chul wheat originally came from the steppes of Russia, where it is grown without irrigation. It can be either fall or winter sown in California and still make a good crop. In its ability to withstand drouth it is a strong rival of the Durum wheats. On three of the University stations it yielded in 1908 without irrigation, at the rate of 51 bushels per acre at one, 63½ bushels at another, and at a third, with less than eight inches of rainfall, 63.3 bushels per acre. A reasonable amount of this desirable wheat is available for seed purposes this year by making application to the College of Agriculture, Berkeley."

State Fair.

Secretary Filcher of the State Agricultural Society writes of the good things which are to occur on the state fair grounds this year. He says that the applications for space for exhibits are far in excess of any preceding year up to this time. To meet this increase the accommodations at the fair grounds have been added to materially. To enhance the atractiveness of the occasion the people of Sacramento have joined in a "Fiesta of the Dawn of Gold" which will give a spectacular entertainment for the visitors. The hotels and the people generally are making every effort to care for the immense crowd expected. One estimate is that 200,000 strangers will be in the city during the fair week.

Another feature which will attract much attention on Tuesday, September 6th, will be the observance of "Exposition Day." On this day the fair grounds and the entire city of Sacramento will be thrown open to San Francisco enthusiasts who will make the most of the day in boosting for "San Francisco—1915."

There seems to be a general boosting spirit manifested, and so far as we can learn the agricultural features of the fair will not be slighted.

Capturing Thrips.

The daily press chronicles the construction by a Dinuba man of a machine which has been used by vineyardists in that section to capture thrips which are a pest in many vineyards. It is yet too early to predict the success of the machine, but the working model is described as "looking good to practical workers who have seen it in the field." The account states:

"A sack containing twenty-five pounds of the thrips was exhibited yesterday showing what the machine could do in one day's work from muscat vines and the thrips were taken from the vines without harming the crop in the least—in fact with decided benefit to the latter. A few days ago Mr. Driver applied the machine to his Thompson vineyard and since that time the vines have livened up until now it looks like a new vineyard.

"In the operation of the thrips machine the outfit mounted upon an ordinary wagon bed, is driven through the vineyard and the row of vines covered with a canvas canopy. This also extends entirely over the thrips harvester and the operation of a large blower by a ten horsepower gasoline engine gives a suction which gathers in the thrips and the insects are then blown back through a seive and grinder and into a receptable from which they are taken and burned. The machine makes a clean sweep of the thrips from the vines when going over the vineyard and has proven what it is capable of doing when in more perfect form."

The apricot outlook is exceptionally promising. A number of producers have sold at ten cents and some under that, but the larger producers of Southern California have united and agreed to sell for ten cents or better, and are now considering advancing their holdings to eleven cents. We have heard from Mr. Ong of San Jose that the crop in that valley is running nearly twenty per cent lighter than anticipated. It looks as if the wise apricot producer would secure just returns this year.

The Crop Reporting Board of the Department of Agriculture estimates that the average condition of corn on August 1st was 79.3 as compared with 85.4 last month and 82.1, average for the last ten years. The southern states show better condition of corn than the middle and western states. The average condition of winter wheat is reported by the board on August 1st at 92.6; spring wheat at 61.

Touching upon the report circulated by apricot buyers that the Crop Reporting Bureau of the Department had published that the apricot output would be immense this year, Mr. Berneike of Santa Ana writes us that he has a letter from Washington stating that no such report has been issued by the Department. In fact, the Department does not touch upon the condition or the output of apricots. Peaches it does refer to as showing the country over a condition of 87 per cent of normal. Apricot growers must keep their own counsel and not be influenced by false rumors.

Agricultural News Notes of the Pacific Coast

Northern California

A vegetable cannery is proposed for Gridley, Butte county.

One orchard at Gridley is shipping two cars of peaches daily.

Yolo county's almond crop promises exceptionally good returns.

A thousand ton lot of alfalfa hay was purchased at Gridley last week.

Thousands of acres of forest land were burned over near Sonoma, Sonoma county, last week.

A small fruit grower at Red Bluff has filed on 15,000 miner's inches of the waters of Cottonwood Creek.

An effort is being made to form a deciduous fruit growers association for Butte county.

Directors of Levee District No. 1, Sutter county, have decided to raise the levees surrounding their lands.

Beet growers near Cottonwood, Sutter county, have harvested most of their crop.

The Sutter County Almond Growers Association has voted to proceed at once in the building of an almond packing house.

Butte county's grain harvest is proving satisfactory, the crop holding out well and nearly as good as the early spring promise.

The Sebastopol Berry Growers Association had good success in shipments of blackberries to the East this year.

The fair at Ferndale, Humboldt county, is to close on Friday, September 9th with a big Admission Day celebration.

The upper Sacramento is lowering rapidly and at the end of July the river boats had difficulty in passing Butte City.

Yolo county seedless grapes are estimated to be twenty-five per cent short of the 1909 crop owing to sunburn.

The cheese and dairy industry of Vernon, Sutter county, was never in as prosperous condition as at present.

The big exhibit of Gravensteins at the Sebastopol Show was said to have been made of genuine apples, which makes Sonoma county proud.

The Native Sons' parlors of Contra Costa county are planning to scatter their line of march at the San Francisco Admission Day parade with almonds grown in that county.

Not only have the fruit shipments been heavier than last year, but returns this year are far better than for several years. The standardization movement is declared to be most beneficial.

State Commissioner Jeffrey has word from fruit importers at Amsterdam that unless higher grade of more uniform fruit is packed they cannot continue to handle California fruits.

Acting Secretary Moore of the Department of Agriculture has written that an expert of the Bureau of Entomology will investigate the pests which have proved perplexing to hop growers.

Central California

Alpaugh, Tulare county reports excellent grain crop.

Old crop Muscat raisins are selling at Fresno at 2½ cents.

San Jose Grange discussed vegetable growing at its last meeting.

Prune growers at San Jose have refused 4¼ cents.

The yield of grain in the Alpaugh section of Tulare county will be exceptionally large.

Watsonville, the apple shipping center, is being invaded by the usual corps of apple pickers and packers.

A field of cotton near Delano, Kern county, has proved that cotton will grow exceptionally well there.

It is proposed to construct a railroad from Laton into the rich country to the west.

Prices of raisins are slowly ad vancing and packers are now holding at 5⅜ to 5½.

The Armsby company is offering San Joaquin Valley peach growers from 4½ to 4¾ cents.

Wine grape growers are predicting that prices of wine grapes will range from $8 to $10.

The prune crop of Santa Clara Valley will be light, but at the same time is reported better than any since 1896.

Saratoga, Santa Clara county, reports its output of apricots 70 per cent of a full crop.

Morganhill, Santa Clara county, prunes are dropping though it is hoped a fairly good crop will be retained.

Funds have been secured for the construction of the weir of the People's Ditch Company across the Kings river above Hanford.

Orange orchards at Porterville, Tulare county, are showing a fairly heavy crop, and it will fully equal last year's output.

A grain grower near Stockton harvested 3000 bags of excellent barley from 100 acres of land, which he sold at 94 cents per cental.

Santa Clara Valley apricot growers are being freely offered ten cents, and one grower reports offer for specially fine lot as high as thirteen cents.

The Outing Farm in the hills of the Santa Clara County has proved exceptionally valuable to a large bunch of youngsters brought there largely from San Francisco.

The inspector of Tulare county held up a car of orange trees last week because of black scale. They were defoliated and fumigated before delivery.

The grain output of the Salinas, Monterey county section, is reported much lighter than last year, due largely to hot weather early in the season.

The apricot crop in the Santa Clara Valley is running from 10 to 20 per cent lighter than anticipated. Peaches are in abundance and rather hard to dispose of. There will be a fair crop of prunes in some orchards, while others are almost bare.

Southern California

Almonds are already being harvested at Elsinore, Riverside county.

A creamery is being built at Alamorio, Imperial county.

There are only about 35,000 bags of last year's holdover lima beans to dispose of.

Antelope Valley, Los Angeles county, has sunk over a hundred wells during the last year.

The dairymen of Antelope Valley are discussing the question of erecting a creamery at Lancaster.

The work of diverting the Whitewater river to the orchards of Banning is progressing rapidly.

Two orange packing houses at Fullerton, Orange county, have closed for the season on Valencias.

The Imperial Valley Oil and Cotton Company will erect a gin at Calexico.

The first cotton ginned in the Imperial Valley for 1910 was at El Centro August 4th.

Horticultural Commissioner Bishop of Orange county is urging all to join in the campaign against Johnson grass.

Many large citrus growers are emphatic in the claim that the railway figures for 50,000 cars of oranges next year are far too large.

The date groves near Coachella and Mecca, Riverside county, give promise of being a commercial success.

The directors of the orange exchange at Cucamonga have resolved to materially enlarge their packing house.

The directors of the Orange County Dried Fruit Growers Association contemplate advancing minimum price on dried apricots to 11 cents.

The percentage of sugar in the beets delivered to the Southern California Sugar Co. at Santa Ana is averaging 19.8 per cent, which is much better than last year.

A grape grower at Mecca, Riverside county, has produced a new grape which he has named the Golden Green, claimed to be superior to the Malaga which it resembles.

Orange county reports fair lima bean crop, Los Angeles county crop looks good, Ventura county, excepting in spots where wireworms have done destruction, exceptionally good.

A large citrus grower at Highland, San Bernardino county, suggests that citrus growers be careful in the planting of large numbers of grape fruit trees, as he fears there may be danger of overproduction.

The flow of water of the Colorado into the heading above Imperial Valley is increasing every day and promise is made that the normal amount will soon be supplied to irrigators.

The largest wine grape vineyard in the world is said to be that of the Italian Vineyard Company at Cucamonga, San Bernardino county. It contains 3500 acres and adjoining it are the vineyards of the Riverside Vineyard Company which has 2200 acres.

The Coast

Yakima, Washington, is shipping thirty cars of peaches daily.

Grain growers at Nez Perce, Idaho, have settled upon bluestem as the best adapted to Idaho conditions.

The Hawaiian Experiment Station has successfully budded one variety of cotton on another.

Extensive tests of Chinese and Japanese matting sedges have been made in the Hawaiian Islands.

Palouse, Washington, reports great suffering of stock on the ranges because of drouth.

The rainy season for Southern Arizona is on ,and the dry farmers are hilarious over recent copious rains.

Extensive irrigation schemes are under way for vast areas on the Island of Mindanao, Philippine Islands.

Indian lands on the Nez Perce Reservation at a recent sale commanded for a small tract at the rate of $480 per acre.

Montana sheep ranges are giving very short pasturage, but permits have been granted to turn the sheep in the national forests.

The Country Life Commission of the state of Washington will hold sessions during the National Apple Show at Spokane.

Farmers near Kendrick, Idaho, find profit in using beans as one of the crops in rotation. Bean threshers and cleaners are being installed.

The showing of live stock at the Spokane Interstate Fair which will be held October 3-9, promises to lead all former exhibits.

A large amount of grain near Pullman, Washington, was cut for hay because of drouth preventing the filling of the grain.

White Salmon Valley, Washington, will make its first shipment of apples this year, aggregating about 30, 000 boxes.

The Division of Forestry, Hawaiian Islands, made experimental plantings of eucalyptus this spring at the rate of about 2,000 trees per week.

The Division of Forestry of the Hawaiian Islands gives expert advice to owners of large tracts of land who will make practical experiments in forestation.

Farmers of Clarke county, Washington, under direction of the Pomona Grange of the county held a two days' celebration and picnic at Sara, August 10 and 11.

The Council Valley Growers Association in Idaho will make a large exhibit of apples at the National Apple Show in Spokane. There are almost a half million young apple trees in that valley.

The sweepstake event of the Third National Apple Show to be held in Spokane, November 14th to 19th will be a gold medal and one thousand dollars in gold. Prof. H. E. Van Deman will make the award.

The Farmers Educational and Cooperative Union has secured a cut on storage charges from the warehouse companies. The rate will now be forty cents a ton as against fifty cents formerly.

Coulson's
EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying power and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Get it at your dealer's; anyway send for our Catalog which tells about the famous Coulson products and gives valuable information about Poultry Raising.

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

THOSE HALF GROWN CHICKS.

By Mrs. Frank Metcalf.

WE must guard our older chicks with greater care, for often those ungainly speckled youngsters feather up beautifully, and their loss means much more than it would have when they were smaller.

The problem is, how to house them closely from midnight prowlers, and yet give them plenty of room and air. Close coops won't do these warm nights, or roup will get them, or they will run into consumption. Fresh air and clean coops they must have, and a free use of wire mesh is the cheapest method of protecting them from one enemy and guarding against the other.

An inch square of wire mesh, placed over a knot hole in a brooder would have saved a flock of 52 that were killed by a weasel a few nights ago, not many miles away, but there was thought to be no danger from this pest, so it was left unguarded.

Skunks and rats also kill many young birds, as well as old ones, so supply your premises with plenty of wire mesh to protect all coops.

Did I hear some one growl out, "It's nothing but buy and buy and buy." Well, then, save at the spigot and lose at the bunghole" as the man I mentioned above did. A penny's worth of wire mesh would have saved 52 chicks, and he would have been very willing to have given it, had he dreamed of the danger lurking near. Don't trust to luck in the chicken business, or you will invite bad luck of the worst kind. At least you will lay it to bad luck after it's over, and say the chicken business is no good anyway. It isn't for those who won't heed. A good terrier is one of the best pest exterminators we ever owned, and a cat is not to be despised if she is trained not to eat chickens, which may be done by letting her stay around the brooder while they are small and watching her until you are sure she don't molest them. A smart whipping or two usually teaches her that she is not to touch them, if she tries to play with them. But neither cat nor dog will likely get a weasel, so the safest way is to keep your coops weasel proof at night.

What a discouraging thing it is, to wait on an incubator faithfully for three weeks, then carefully fit up a brooder and go out some morning and find every chick lying with a tiny hole in its head!

How much more discouraging to 'tend them until frying size and find the same condition some unhappy morning, just when one has planned what one can buy with that broiler money. So let me add: Take all necessary care of the baby chicks, but don't let those half grown ones suffer for the least mite of care they need. Watch for mites and lice, and guard them from larger foes for just a little while longer.—Mrs. Frank Metcalf.

Don't fail to give the growing chicks plenty of fresh air at night, but,

BUFF MINORCAS.

The newest aspirants for favor in the fowl world are the Single Comb and Rose Comb Buff Minorcas originated by Mr. N. E. Luce at Binghamton, New York, in 1900. These birds have not been given place in the Standard as yet. In fact their qualifications have not been agreed upon until recently. Some months ago President Wright of the Pacific Minorca Club appointed a committee to formulate a standard for the new breed. The committee consisted of Messrs. N. E. Luce, C. C. Bonnell, H. T. Paschall of Los Angeles and Mrs. J. B. Hill of Vestal, N. Y.

The Committee reports:

"We have given no more latitude to breeders of this new breed than is allowed to the breeders of the other varieties of Minorcas and have adhered closely to all standard requirements of the Minorca family. While realizing that it is a new variety and is not so easily bred true as yet, we firmly believe that in the end the Standard as formed will be for the best interest of this new breed, and therefore we ask all judges in passing on the Buff Minorcas to use this standard and to apply it as they would were they judging any of the other varieties of Minorcas. We herewith present the following Standard:

Cock 8 lbs., Hen 6½ lbs., Cockerel 6½ lbs., Pullet 5½ lbs.

Shape.—The same shape to apply as the Standard requires for the Single Comb Black Minorca.

Disqualifications.—Red in ear-lobes covering one-third or more of the surface—yellow legs, yellow skin. All general disqualifications to apply the same as for the other varieties of Minorcas.

Color of Male.—Beak, horn color; Eyes, dark hazel; Face, bright red; Comb, bright red; Wattles, red; Ear-lobes, white; Shanks and Toes, dark or medium slate; Skin, flesh or pink white.

Plumage.—Surface color throughout a rich even shade of golden buff, free from shafting or mealy appearance, the head, neck, hackle, back, wingbow and saddle richly glossed with metallic lustre. Under color a lighter shade of buff, free from foreign color.

Black or white in wings or tail is equally objectionable and is to be considered a serious defect.

Color of Female.—Beak, horn color; Eyes, dark hazel; Face, bright red; Comb, bright red; Wattles, red; Ear-lobes, white; Shanks and Toes, dark or medium slate; Skin, flesh color or pinkish white.

Plumage.—Surface color throughout an even shade of rich golden buff, head and neck plumage showing a metallic lustre of the same shade as the rest of the plumage. Under color a lighter shade of buff free from foreign color. Black or white in wings or tail equally objectionable and is to be considered a serious defect.

Rose Comb Buffs.

Same as for Single Comb, except a rose comb to conform to the comb of the black variety.

Give your hens a bath.

Burn the old feathers and nesting material.

F. Baldwin's WHITE LEGHORNS

1st Ckl. A.Y.P. Ex.

Won 9 prizes from 9 entries at A. Y. P. Ex. and 4 1sts at San Jose, '09. Bred as layers first. Stock any age for sale. Eggs $6 per hundred. Settings $2 up. Send for free booklet and prices. ***46 Washington Ave., San Jose, Cal.***

The Arenberg Brooder Heater and Stove

Perfectly simple, safe and cheap. Burns distillate, furnishes steady, free flame and easy to manage as brooder, heater or stove. Write for details. **H. F. ARENBERG**
Petaluma, Cal.

Do You Own a Hen?

Do You Want to Build a

Fresh Air House.

Open-Front Colony House—Three Plans.

Tested Hot-Water Brooder House Designed by Leading Engineer.

Colony House for Chicks with Movable Muslin Frames in Front.

Combination Brooder and Colony House.

Special House for Extra Males or Small Matings—Two Plans.

Movable Fence for Mature Fowls or Chicks—Six Plans.

Trap Nest that Traps—Two Plans.

Special Nest for Five Setting Hens.

Safe and Convenient Brood Coop for Chicks—Seven Plans.

Special Coop for use in a Garden.

Design of Fireless Brooder—Seven Plans.

Tested Hot Air Brooder—Three Plans.

Basket for Shipping Eggs—Two Plans.

Reliable Food Hopper—Five Plans.

Good Water Fountain.

Vermin-Proof Roost Support.

All the above and many more found in the book.

Built and Used by Poultrymen—Price 50c.

No Chance for Failure

Each of the above designs, and many more, is fully explained by the builder, and illustrated with one or several clear drawings. Anyone can follow the simple instructions. No theories, no extravagant ideas to mislead you, but the money-making, completed houses and coops prove what the Builders say is true. Read their own words and learn how they do it. One plan will pay for the book.

For a Short Time Only

For new subscribers or a renewal to the Cultivator, we will give you one copy of this great book FREE with

"Built & Used by Poultrymen"	$ .50
"The Standard & Poultry World"	.50
"The Cultivator," one year	1.00
Total Value	$2.00
All Three for	**$1.50**

We most certainly recommend this book as one of the best of its kind ever published and our readers should avail themselves of this opportunity at once to get a free copy as above.

Enclosed $1.50 for club order with new book.

BEETS AS GREEN FOOD.

One of the best green foods for poultry is one that is seldom written about—the sugar beet—a food particularly valuable for promoting the growth of young stock, the later broods of which are undeveloped when cold weather comes on.

In 1909 I had a number of late-hatched chickens. They were small and poorly feathered when October arrived, and the weather was unusually cold. Having a quantity of beets on hand, I fed them, and the chickens ate not only readily, but almost greedily. I continued feeding the beets until my entire lot was consumed. I never had chickens thrive better. They grew and feathered rapidly. I simply cut the beets in halves and threw them into the pens, and not a scrap of them was left unconsumed.

I believe it is the sugar in the beets that helps to account for the chickens' fondness for them. I know that one of the methods employed to bring exhibition fowls quickly up to weight, is to give them for drink milk thoroughly sweetened with molasses or sugar. I have placed a pound to a pound and a half of weight on cockerels by the use of sweetened milk, with other foods of course, between two shows separated by ten days' or two weeks' time. If sugar given in the milk will thus hasten development, why will not sugar in the beets do the same?

In the summer-time fowls on free range find all the green food they require; yarded fowls are easily supplied. For summer use there are few things better than a piece of white clover, cut every week or so.—Farm Journal.

The egg is taking more extensively every year the place of meats, and in this era of high prices it is more nearly than ever the "farmer's beefsteak." And the wagonloads that we use in a year! If he should keep an account of the family egg consumption and add up the sum total at the end of the year, it is doubtful whether he would be able to believe his own astonishing figures. Almost the majority of farmers would find that they used in the farm house more eggs than were taken to market. And there are other wagon loads of eggs that are marketed on the "exchange" plan, where their value is arbitrarily determined by the country grocer and the farmers "take it out in trade." Many farms secure their entire supply of groceries in this way; yet this additional credit is not added to the poultry earnings of record, and the old hen is practically cheated of much that is her due; possibly one-half would not be a greatly exaggerated estimate. However, to be well within a conservative figure, a sum equal to one-sixth of the amount as credited by the government statistics may easily be added to the "value of poultry and eggs produced on the farms" last year. As Secretary Wilson says that this industry has advanced at such a rapid rate, that no arithmetic can keep up with it, we may expect that this year will be millions ahead of last. It is quite to the point in this connection to say that farm poultry products have increased nearly three times in value since that last census year.—Coleman's Rural.

FEATHERS.

The man who keeps hens is not so much of a philosopher as the man who has the hens keep him.

Poultry culture has been reduced to a science. Science is just another word for good business attention.

One reason why the women folks are more successful with poultry than men are, is that they more carefully attend to the details.

There are many breeds, and all have their merits. He has the best breed who gives it the best care and aims to secure the most good out of it. Feed, in this particular, has a great deal to do with success.

When a hen lays now and then, and not soon again, and you can't decide whether she hadn't better quit altogether, I'll tell you what to do: Why, just ax her to, and neither in box nor in keg will she ever lay another egg.—Farm Journal.

FARMER VINCENT'S WISE SAYINGS.

A little more clean litter on the floors. Keep the fowls hard at work. It is the price of health.

A shelf, a couple of feet below the roosts, is handy to catch the droppings, and handy to clean. And don't forget to clean it.

Every week there should be a fresh supply of clean, fine earth in the dust box.

Is there a place under some old building where you can spade up the earth and give it to the hens to work at? They will dig away hard to find the worms that may be in it. Nothing will do them more good.

Sell off your old rooster and get a better one than you ever had of some neighbor. If your neighbor hasn't one, go to somebody else's neighbor. Find one somewhere, for it will pay.

For hatching purposes take the eggs from the hens that lay best. Build up; never let the standard down.

Watch the hens. Find out which are doing the best work and let the rest go as soon as you can.—Farm Journal.

QUICKLY GROWN BROILERS.

The following is said to have been thoroughly tested for results, and not only tested but actually practiced by a firm of extensive poultry breeders that sell their cockerels as three pound broilers at six weeks old:

Feed the young chicks a mixture of cracked corn and cracked wheat for three days. Then give them a good dry mash, and also feed cracked corn, cracked wheat and hulled oats in a deep litter. When about four weeks old add to feed already mentioned a wet mash once a day, the mash being made of a well balanced dry mash, about half corn meal mixed with molasses. Keep grit, oyster shell, and clean fresh water constantly before them. It is claimed this system of feeding will produce plump, marketable broilers at six to eight weeks old.—Review.

The word "mash" is often used in connection with poultry feeding and nearly every week some one asks what it means. It is understood that a "mash" is a mixture of ground grain, meat or other materials. A wet mash means that this mixture has been wet with water or milk and fed in a crumbly or a soppy condition. The dry mash may be the same mixture without moisture.

GERMOZONE

Is the Best Roup Cure I Have Ever Tried

Among the many who say that are a lot who never thought Germozone would do it. Geo. H. Lee knew what Germozone would do before he placed it on the market. It is *so good* that users are not tempted to accept a substitute. No one ever found anything so good. The reason is plain—Germozone has no equal.

500 HENS SAVED

A Missouri poultryman writes that 8 bottles of Germozone saved his *entire* flock of 500 hens from Roup. Less than *one* cent per hen. A Pennsylvanian writes that Germozone would be cheap at $5.00 a box —and it will do for *you* what it has done for others. This advertisement is addressed to *you*. We want your poultry to make more money for you. We want you to recognize the importance of healthy poultry. The health of the chick or the hen is as important to it as your own health is to you. Ever stop to think about it? Perfect health is necessary for positive profit. Try Germozone and test every statement made here. No need to buy a substitute. If your dealer cannot supply you we will mail it to you, postpaid, on receipt of price—50 cts.—and will include *free* a copy of "Chicken Talk," written by Mr. Lee himself.

Come in and see our new 1911 line of Mandy Lee Incubators and Brooders at our newly opened Los Angeles branch, 225 West 2d St.

Irrigation and Forestry

"HOW FIRE HELPS FORESTRY."

THE August Sunset has an article with the above title. It treats of "The Practical vs. the Federal Government's Theoretical Ideas." It starts off with the statement that "Practical foresters contend and can demonstrate that from time immemorial fire has been the salvation and preservation of our California sugar and white pine forests."

"The practical invites the aid of fire as a servant, not as a master. It will surely be master in a very short time unless the Federal Government changes its ways by eliminating the theoretical and grasping the practical."

"The practical says, 'Let the fire at the proper time of the year run at will,' in the forest described, rather than not at all, as it can be clearly demonstrated that the class of forests named is greatly benefited rather than injured by this manner of treatment. The proof is abundant; magnificent virgin forests of the class described that have been subjected to fire at will, and not at selected favorable periods of the year, for the past five hundred to perhaps two thousand or more years."

"The practical would have removed the cause a safe distance from the tree in advance of the servant fire."

These and similar statements, cover six pages of the magazine. Replying to this article Mr. G. M. Homans, State Forester, writes the Cultivator:

In the August number of "Sunset" Mr. Geo. L. Hoxie attempts to show that practical men consider the government policy with regard to the preservation of the forests of the state from fire to be fundamentally wrong. This is very far from being the case. The most important lumbermen of the state are in complete accord with the government policy (which is also the policy of this office) and some of them whose holdings are intermingled with those of the government turn over the matter of fire protection to the government, simply paying the cost of patrol and fire fighting according to their acreage. Practically all of the big lumbermen have some of their employees appointed state firewardens. These men have power to arrest for violations of the state fire laws, to summon assistance in fire fighting and to issue permits to burn dangerous areas under such restrictions as will prevent the escape of the fire.

Mr. Hoxie's misunderstanding of the government's timber sale policy is almost perfect: He says: "The practical invites the aid of fire as a servant, not as a master." So, Mr. Hoxie, does the "theoretical." One of the conditions inserted in every government timber sale contract is to the effect that the brush, limbs and other debris caused by lumbering operations shall be piled in such a way that it can be burned when the logs have been removed from the area. Mr. Hoxie further says: "Milling operations in practical forestry would consist of simply a harvest of the ripe and mature timber and cleaning thereafter by the use of the servant fire." It would be difficult to summarize the government policy more accurately.

In fact the only real point of disagreement between the government's policy and that of Mr. Hoxie is this: He says "Let the fire at the proper time of the year run at will rather than not at all." although he acknowledges that "fire running at will is master." This point of view is absolutely selfish. There is no necessity for fire "running at will." A fire started at the proper time of the year can always be confined to the area that really needs clearing though it may cost something to so confine it. During the last year the state firewardens and government rangers granted over 3000 permits to burn dangerous areas and only three of these fires got away to run, for a time, at will. No doubt there are still large areas that need cleaning up. No doubt also the worst of these are the ones logged by "practical" lumbermen, but the most practical of these, instead of following Mr. Hoxie, take advantage of the state fire laws to burn such areas with care.

Mr. Hoxie's plan appears to be to wirte an article for a popular magazine suggesting strongly that the fire laws were made to be broken, in the hope that some careless camper will be convinced and will start a fire that will "clean up" the forests of the state. At any rate that seems to be the most important result likely to be produced by the article in question.

THE EAST AND IRRIGATION.

A recent letter referring to the hostility of the East to irrigation projects and to the arm-chair critics of the eastern section of the country who fear that the reclaiming of the western lands will introduce dangerous competition with eastern farming communities, calls for a suggestion that it is a mistake to suppose that there is any general hostility in the East to the reclamation of the arid lands of the West. Such opposition as there is has been largely stimulated by the western enemies of national irrigation, who, though few in number, have sometimes been abnormally active. It may be remembered by those who participated in the movement to secure irrigation legislation, that the support of the East through its newspapers, through the good will of its people, and finally through the very necessary votes of its representatives, was freely accorded, and the East as a whole has always supported the reclamation work, believing that the development of the West was a development of the United States. We have frequently had occasion to note a lack of reciprocity of this sentiment on the part of the West. Looking at the subject from a national point of view, we can only suggest that the very best thing for the people of both sections is to become acquainted with each other and with the different parts of our great country, to know their mutual needs, and to drop sectional jealousy and rivalry and consider national development from a national standpoint. The only competition should be a competition to see which section will do most by its own energy and ability for the common advancement. There is need enough for all the land in the United States to support the people who will be living here within the coming century. Widespread intensive cultivation of all lands that can be made available for that purpose, and the growing of forests, for wood supply and protection of springs and streams, on all non-agricultural lands are the means by which alone the future welfare of the country can be maintained.—American Forestry.

AGES OF DIFFERENT TREES.

The pine reaches a maximum age of 700 years; the silver fir, 425; the larch, 275; the red beech, 245; the aspen, 210; the birch, 200; the ash, 170; the elder 145, and the elm, 130.

Boston Ivy, with its glorious autumn coloring, cannot be excelled for brick or stone walls and attaches itself and will thrive in any soil. English Ivy, Virginia Creeper, Myrtle, Honeysuckle, all are good.

A CURE FOR ALKALI.

Almost all soil contains more or less alkali. Whenever the soil strata are such that there is no natural underdrainage, and water is applied to the surface it generally collects in the basin, the surface of the underground water gradually rises, and when it gets near the surface, excessive evaporation occurs and as the moisture passes away as pure water the salts contained in the water are left at the surface of the ground. In due time some soils take on a white appearance and vegetation suffers.

Naturally, the cure for this condition is to lower the water table, and if there is no natural drainage, this must be done by artificial drainage. Anything that will provide a channel through which the underground water may get away will answer the purpose. Brush, boulders, flag stones, tile and lumber have been successfully used.

In many cases tile have proved to be unsatisfactory. Both cement tile and some burned clay tile have shown the effect of alkali, and there are instances where each has disintegrated and gone to pieces in a few years.

The open-bottomed wooden box seems to last as well as anything, and there are instances where these have been in service for 18 years and the wood is still sound. Wood kept absolutely dry will last indefinitely, and wood kept soaked will also last indefinitely. There are instances where piles have been driven and kept continually covered with water. After centuries of time these piles have been removed and found to be as sound as they were the day they were driven.

A wooden pipe or box used for a drain is surrounded by moist earth and water continually runs through it, so it is saturated, and therefore has a long life under these conditions.

Get a good engineer to plan and lay out your drain for you and it is necessary for him to make an examination of the subsurface soil as well as of the surface soil in order to intelligently place the drain.

This is a common statement: "My ground will not drain, for I have tried it." If an investigation is made, however, nine times out of ten it will be found that the drain is an open drain, the banks have caved and choked the channel, and weeds have been allowed to grow in it. Of course, it won't work under these conditions.

Wooden boxes are easier to lay and lay properly than tile, for the sections are longer and there is less danger of tilting and choking the channel. Remember, however, that in all cases careful work must be done if the drain is to be a success. It is not an exaggeration to say that all land can be drained if the system is properly planned and the work properly done, and this is the permanent cure for alkali.—E. B. House, Colorado Agricultural College.

LIFE'S GARDEN.

There are flowers in life's garden
 To make its pathway fair—
The rose in bloom with sweet perfume,
 The orchid rich and rare,
The daisy and the violet,
 The lily of charity
And the yellow and blue forget-me-not,
 The flower of memory.

RUSSIAN THISTLE SEED.

On twelve different occasions the seed of Russian Thistle has been found in samples of commercial crop seed sent to the Indiana Branch Seed Laboratory of the U. S. Department of Agriculture, for examination. It has been found in these samples in amounts ranging from 1440 seeds in 16 pounds of alfalfa, or enough ordinarily to sow an acre, up to 33,120 seeds in 16 pounds of alfalfa. Thus far in samples examined here, it has occurred in alfalfa seed only. All the crop seed in which Russian Thistle seed was found was imported from other states. Furthermore the weed itself is known to be growing and reproducing itself in several localities in Indiana.

What the Seed is Like.

Russian Thistle is slightly larger than clover or alfalfa seed. Unless it has been rubbed off, the seed proper will be found to be capped by a thin covering, which is simply the shrivelled and dried outer portion of the flower. This helps to distribute the seed. The shape of the whole body is conical, color light to dark gray, greatest diameter one-twelfth of an inch; height one-twelfth of an inch. Beneath this outer cover is the seed proper, also cone shaped and covered with a nearly transparent membrane, through which the spirally coiled young plant within shows. Moisten and rub off the membrane and see the greenish embryo inside. The broad end of the seed proper is hollowed out more or less. Color of the seed light to dark gray, diameter and height one-sixteenth of an inch.

What the Plant is Like.

It is not really a thistle. It is a tumbleweed, a close relation of the Lamb's Quarters and Pigweed, and like them an annual and a prolific producer of seed, 10,000 to 300,000 per plant. The leaves on young plants are about two inches long, slender, and green. As the plant approaches maturity, the leaves fall off and are replaced on the flowering branches by numerous half inch spines; the plant branches, becomes bushy, two feet high and two to six feet in diameter; the outer branches are usually red at maturity. When dry, it breaks off at the ground and is carried hither and thither, far and wide, with every shifting wind, scattering its seed as it goes.

What is to be Done.

I. Learn to know the seed and plant. 2. Examine seed carefully before buying, and buy seed free of Dodder and Russian Thistle. Plenty of such seed can be had. 3. Pull up and destroy odd plants that appear in the fields. 4. If infestation is extensive, encourage seeds to germinate, and destroy seedlings; when and how this may be done depends on character of crop on the field. 5. Short rotations, involving clover and well tended cultivated crops, annihilate millions of annual weeds of many kinds.

Bear in mind that to know what to look for, to be prepared to deal with it, and to "nip in the bud" this threatening pest will save Indiana farmers hundreds of thousands of dollars.—Bul. Indiana Ex. Sta.

Only the man with money can afford to be lazy, and he seldom is.

When you are down in the mouth, think of Jonah. He came out all right.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

"Holding Up" Milk.

One of my heifers holds up her milk even now after her calf has been sold to the butcher. Do you know of any remedy? Some of my heifers have the scours. My alfalfa was seeded this spring and there are some alkali weeds mixed with it. Would that have any effect on this trouble?—W. S., Kerman.

Dairymen try to keep the cows happy and have found that they mourned less for their calves when separated early. It would be much easier to let the calves nurse and then milk the rest if it did not injure the cows. When this is done the cow resists giving up the last of the milk and soon dries herself off. Now a little bran or other grain fed to the heifer will distract her mind from her troubles and often they let down all the milk readily. Take time, pet and handle the heifers very gently. Rubbing and kneeding the udder will often help to induce the milk flow. Keep patiently at it until the milk is all taken from the udder. Remember this is a case where a mother is mourning for her young and she must be soothed not forced until resignation comes for her loss.

A little dry hay would probably stop the scours. Be careful not to make the cows run when bringing them in from the field. Heifers have to be handled with great care as they are naturally panicky and running is bad for them. I would prefer the scours to bloating on alfalfa, but if it runs on too long it may cause gas and bloating. A little bran with a teaspoonful of common baking soda often corrects these troubles where there is no dry hay to give them.—M. E. S.

At Calving Time.

Can you tell me what to do for my Jersey heifer? She had her first calf two weeks ago and I fear she has not cleaned herself properly. She gives two and one-half gallons per day. Is this enough milk for a Jersey heifer to give after her first calf?—Subscriber, Terra Bella.

Use a warm douche twice a day for this heifer, adding to every quart of warm water used one teaspoonful of hyposulphite of soda. Add to her bran a teaspoonful of the hyposulphite of soda twice a day for a couple of weeks.

To Drive Away Ants.

One of the most perplexing pests around the house and outbuildings is the ant. Many remedies have been given in the Cultivator and many more are advertised—doubtless all of value. An Ontario subscriber, Mr. John Barnhard, says he has accomplished immediate and complete eradication of ants by the use of Standard sheep dip mixed in the proportion of one to five and sprayed around the buildings. Every ant disappears promptly. Mixed in the proportion of one to ten it is an excellent spray for aphis and may be used on the most tender plants.

Weeds on Roadside.

Has the county through any of its officers a right to tell me to keep weeds from the county roads?—Subscriber, West Saticoy.

The horticultural commission of your county has power in this matter, but as the road has been deeded by you or a predecessor to the county, it is possible that it is the duty of the county supervisors to keep the roads clean of weeds. It must be admitted, however, that the county and state authorities usually insist on the abutting property owners keeping street shade trees pruned up to a certain height, and we presume it may be the privilege of the same supervisors to insist on abutting property owners keeping down weed pests. There is only one law which touches upon the subject directly, and that says that it shall be the duty of the board of supervisors to subdue weeds on the roads once each year. In the case of a pest this will not suffice. This question will probably be settled within the next few months.

Pruning Apricots.

I have peach and apricot trees cut heavily last winter. This spring they put out very strong growth, no fruit. Does this new growth require cutting back?—F. D., Azusa.

Had the trees been pruned to the extent of a third or a half this season's growth immediately after the fruiting season, it is possible it might have induced setting of fruit buds which next year would have given more of a crop. Heavy winter pruning always induces heavy summer growth. While it is now a little late for this experiment, we would at least try it on a few trees.

Persimmons Dropping.

I have Japanese persimmons—trees five years old—which earlier in the season were loaded with fruit, but at size of walnut, began dropping off. Now all are off the tree. The trees make vigorous growth each year.—Old subscriber, Santa Barbara.

It is difficult to give a definite answer without knowing more particulars, especially as you refer to vigorous growth of trees, but even then it is barely possible dropping may be caused by irregularity of irrigation. An orange tree will continue to grow and show full vigor when irregularly irrigated, but if allowed to get a little dried, say in the latter part of June, when water is put on, will almost surely drop off almost all its fruit. The persimmon, as a rule, holds its fruit, even to overbearing, yet it is barely possible that this dropping is due to the variety. The matter of irregularity of irrigation or of having sufficient moisture at the roots at all times should be carefully looked into.

Variety of Peach.

I send sample of peaches from three-year old trees sold to me for Muirs. On the five acres there are only three or four trees of that variety. What is the name of this peach which we send, and is it as good as the Muir or Lovell for canning and drying? Should they be rebudded?—H. J. Wippert, Hemet.

The fruit arrived badly decayed. Two specimens, however, showed very deep blush over nearly the entire peach, more than the Muir ordinarily takes on, unless the sun of the inland valley gives a deeper color. It is also red about pit. It is impossible to definitely say from the condition of the fruit, but first choice would be Reeves' Favorite and second, Elberta. Either is a fair peach and somewhat similar to the Muir. Another guess is Globe. These peaches, however, would not be good for canning because the deep color about the pit is not considered desirable by canners, at least such was formerly the case, though one canner informs us that a redness about pit is not objectionable now owing to improved process. In that respect it is similar to the Salway. From the dry, solid flesh, we take it this peach would make an excellent dryer. It is a fruit of fair quality and we do not think we would rebud the trees.

Possibly Tomato Blight.

Tomato vines turned yellow at extreme tips of branches and this affection gradually extended, taking the whole vines. Some of the vines are coming out green again and look as if they would bear well in the fall. The trouble usually begins at time second crop tomatoes are half grown. It is nothing like tomato blight. I enclose leaves.—Subscriber, Pleyto.

To be sure that this is the summer or fusarium blight, the inquirer should have sent portion of roots as well as top. The leaves were referred to the Southern California Pathological Laboratory and Mr. S. S. Rogers, assistant plant pathologist, writes:

"Yours of August 10th enclosing diseased tomato foliage is at hand. This certainly seems to be the ordinary fusarium blight of the tomato, but it cannot be told definitely from an examination of the leaves, as the source of the trouble is below ground. It is very unusual for vines once affected to recover and bear good fruit, as your correspondent states was the case. There is no advantage in spraying for this trouble, for, as stated above, the fungus is upon the roots. The best that can be done is to plant clean, healthy plants on clean soil which has grown no diseased tomatoes previously."

Egyptian Corn Fodder.

Is kaffir or Egyptian corn fodder good to feed to stock, and how does it compare with other green fodder? Some say that it is of little value.—A. C. B., San Jacinto.

Mrs. Sherman has written several articles touching upon the value of these fodder plants. They are of value, but as noted in the article in last week's Cultivator, they have been the cause of poisoning when fed at certain stages, but as the same is true regarding corn fodder, and as the danger is so limited, culture of this excellent drouth resistant plant should be encouraged.

Liquid Fertilizer.

How can I make a liquid fertilizer to use on chrysanthemums or potted plants?—K. C. M., Los Angeles.

The best way will be to thoroughly rot stable manure. Fill an old barrel that does not leak with manure. If thrown in loosely there will still be sufficient room for the water. Fill with water, mix and after standing over night it may be drawn off, even dipped off at the top. The barrel may be filled more than once. In fact, as long as the liquid shows good color after standing 24 hours, it will have strength for your plants. In case rotted stable manure is not at hand and immediate results are desired, complete commercial fertilizer may be used instead, but of course the same quantity will not be required to give equal strength of liquid.

Prune Curing.

Please tell me about curing of prunes, especially after drying. How much glycerine should be used in the process?—M. E. H., Del Rey.

The less processing in curing of prunes the better. There is a fair possibility that the use of glycerine might bring one in embarrassing relation to the pure food law. We would advise thorough investigation before dipping in glycerine. There could be no exception taken, however, to dipping in "syrup" made from the cull prunes boiled in water. In fact, more recently, that has been preferred to the glycerine dip. The prunes are simply mashed and boiled in the water until the proper consistency is secured. The liquid is racked off and used for the dip.

The drying, or more properly curing, consists of allowing the prunes to thoroughly ripen on trees. They are then shaken from the trees, preferably onto sheets, and dipped into lye solution, of a strength of one pound lye to 20 gallons of water, while boiling hot. Wire baskets are used for this process. They are then plunged into cold clear water to remove the surplus lye. When cured, not dried hard, the trays may be stacked or fruit may be put in shallow sweat boxes. Care must be taken not to overdry as it lowers the quality of the fruit. After passing through the sweat, they may be sacked and marketed, or, if packed in boxes, passed through boiling water or syrup first referred to. This removes possibility of insect infestation.

Fertilizing Citrus Trees.

Have citrus trees ten years old. They have been bearing several years and are now well fruited. They have been fertilized several times with commercial fertilizer, also with scrapings from cow corral and chicken yard. I am told they should be given another dressing the coming month and again later. Can get plenty of good cow manure. Should commercial fertilizer be used? If so, what?—G. W. G., Hollywood.

We think we would depend entirely upon the natural manure if it can be had in sufficient quantity. Of course with it a little potash or bone meal may be used. We have heard it said that the time to apply stable manure is when it can be had. If it is put on as a mulch after every irrigation, we think there will be no harm done, although if used in excess, it might result in oversize and coarseness of fruit. This can be determined as the fruit ripens, however. If commercial fertilizers are used, we would not apply at this time of year, excepting possibly the potash which is said to be good for hardening wood growth and sweetening fruit. Quick acting nitrogenous fertilizers should be used in the spring time when the greater growth of the trees calls for such fertilizers.

Fowl Ticks.

Since reading the article relative to the fowl tick in the issue of Aug. 11th I believe readers of the Cultivator will be interested in the methods used by Mr. and Mrs. H. C. Horsman, Dinuba. Their chicken houses became infested with the fowl tick and they tried numerous agents and lost a lot of chickens before learning that boiling hot water applied thoroughly to all cracks and crevices was the most effectual method of killing off the pests. Later it became their practice to use the hot soap suds left over from wash-day each week and by dipping the roosts in the hot soap suds and using the suds freely on the inside of the chicken houses they finally eradicated the ticks. Such a remedy is a cheap, effectual one and every ranch home has a plentiful supply of good soapsuds every week so that one soon forms the habit of cleaning up the hen houses regularly. Another agent used by Mr. and Mrs. Horsman is sulphur. They pick up a chicken by its legs and roll it in sulphur, dusting the sulphur thoroughly into the feathers with one hand.—H. H., Dinuba.

INCREASING CROPS BY LIVE STOCK.

Large crops and live stock go together. All hoofs are golden in their effect upon yields of grain and upon the lining of a farmer's purse. The by-products of the farm—the straw and the volunteer growth incidental to the raising of cash crops—may be combined with the yield of a fraction of the land to produce meat and at the same time sustain and increase the grain yields of the entire farm.

Four years' work just completed on twenty-one demonstration farms in various sections of North Dakota has resulted in an increase of 50 to 100 per cent in the yield of wheat per acre following the withdrawal of part of the land for sustaining stock. The yields of wheat in that state have been around twelve bushels per acre under continuous cropping. The crops on the farms managed by the experiment station to demonstrate a balanced agriculture indicate that anyone can as easily grow an average yield exceeding twenty bushels if he keeps enough stock to eat the corn produced on one-fifth of his land and the hay and oats produced on another one-fifth. This stock produces enough manure to cover one-fifth of his land each year in a moderate dressing. The three-fifths of the farm left in cash grain crops will yield a larger return than the whole farm did when only grain was grown.

The immediate and marked increase in crops from the introduction of stock has been convincing evidence of its wisdom. Last season the yields of wheat on the six original farms started on the test in 1906 averaged 26.5 bushels per acre; on the six farms started in 1907 the yield was 22.25 bushels, and on the eight started last year the yield was 14.5 bushels per acre. It costs practically as much to raise and harvest a small crop as a large one. The added bushels represent practically clear profit and measure a farmer's strides toward prosperity.—Breeders Gazette.

University Farm at Davis will make extensive exhibits at the coming state fair.

Money Making Little Liners

In this department we will insert your advertisement under a classified head for 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for our many thousand readers.

FARM LANDS FOR SALE.

FOR SALE—OWENS RIVER VALLEY. We are preparing to place upon the market 4000 acres of the choicest apple land in the Owens River Valley, which will include one of the most remarkable gravity water systems in the State. This land is wonderful in its productiveness beyond all belief; potatoes that run 500 bushels to the acre, alfalfa three tons to the cutting, timothy with 12-inch heads, the world's fair prize for honey, and last but not least, the finest apples grown on the Pacific Coast. Red winter apples that look like wax. No other land in California to compare with it. Not flat valley land, but foothill land with gentle slope, giving perfect drainage. The choicest apple land will be subdivided into tens, twenties and forties. The most wonderful scenery in America. Fishing and hunting in the high Sierras right at your door. Trout streams within walking distance. Southern Pacific's new main line east now building through valley, but will not be finished until spring, when this land will be formally open for inspection. In the meantime send in your name and address for booklet, plats and price list, which will be mailed to you as soon as they come from the press. This land is not for speculators but for real serious farmers who know the virtues of choice land, water and climatic conditions when they see them. Will make a special and attractive proposition to buyers who will go in this summer and start their improvements before the formal opening in the spring. Will be glad to take a few serious people with me on my next trip into the valley. JAMES R. H. WAGNER & H. S. COOK, 825 Wright & Callender Bldg., 4th and Hill Sts., Los Angeles, Cal.

FOR SALE—815 ACRES IN SAN LUIS Obispo County. A typical dairy ranch. Plenty of wood, water, irrigable land, buildings, fenced and cross fenced. Orchards, vineyards, oranges, lemons and walnuts do exceedingly well here. 40 acres of land suitable for these. Price $21 per acre. For further particulars apply to MRS. F. A. CLINK, Pozo, Cal.

2285 ACRES CHOICE, DEEP, SANDY loam. Ideal for subdivision or Eucalyptus growing. Can be cultivated any day in the year. Southern Pacific Railroad runs through the ranch. Also close to deep water for shipping. Free from wind and frost. Now all planted to grain. Price $100,000.00 for limited time. GEO. W. SILL & CO., Watsonville, Cal.

APPLE ORCHARDS, LARGE AND small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. GEO. W. SILL & CO., Watsonville, Cal.

FRUITS, FLOWERS, SUNSHINE, progress—all these invite investigating beautiful Hemet Valley, Southern California. Booklet free. WILLIAM KINGHAM, Hemet, Riverside County, Cal.

FOR SALE—EL CAJON GRANT LAND. In the heart of El Cajon Valley, 30 acres of choice vineyard, large house, cottage and barn; trays, boxes, etc. Close to proposed electric line. S. B. HAWLEY, 1548 D. St., San Diego, Cal.

FOR SALE—WELL EQUIPPED POULTRY ranch, 19⅛ acres, Sonoma County; good house, barn, brooders, incubators and stock. For further particulars address W. LITER, Windsor, Cal.

FOR SALE—FORTY ACRES IMPROVED land near Corcoran, Cal. Good for alfalfa or beets. J. W. FAIRCHILD, 1090 E. 6th St., Pomona, Cal.

SAN DIMAS NEXT TO GET THE P. E. lines. Ward & Johnson are actual resident citrus growers in this most favored section of Southern California. We have a full list of all orange and lemon properties of all ages and prices. Write us today. WARD & JOHNSON, San Dimas, Cal.

LIVE STOCK.

REGISTERED SHORTHORN BULLS and Poland China Hogs for sale. Best breeding. P. H. MURPHY, Perkins, Cal.

DAIRY SUPPLIES.

MILK COOLERS, BOTTLES, CAPS, brushes, Buhl milk cans, Sharples separators, Babcock testers, veterinary instruments, wood soled boots and shoes, and our celebrated "Prosperity" washing powder. GUY F. KELSEY, 108 E. 8th St., Los Angeles, Cal.

Household Department

HOW DOES IT SEEM TO YOU?

It seems to me I'd like to go
Where bells don't ring, nor whistles blow,
Nor clocks don't strike nor gongs don't sound,
And I'd have stillness all around—
Not real still stillness, but just the trees'
Low whisperings, or the hum of bees,
Or brooks' faint babbling over stones
In strangely, softly tangled tones.
Or maybe a cricket or katydid,
Or the songs of birds in the hedges hid,
Or just some sweet sounds as these
To fill a tired heart with ease.
If tweren't for sight and sound and smell
I'd like a city pretty well;
But when it comes to getting rest,
I like the country lots the best.
Sometimes it seems to me I must
Just quit the city's din and dust,
And get out where the sky is blue—
And, say—how does it seems to you?
—Eugene Field.

THE GIRL ACROSS THE WAY.

THE young man who figures in this is employed in an office in a downtown skyscraper. His desk is by a window that overlooks a court. Directly across the court from him another person works at a window. Yes, this person is a girl, of course. There wouldn't be any sense in taking off one's coat and recording a lot of facts about two men working at two windows at opposite sides of a court, would there?

Now a young woman, if she be of face and form and garb that constitute a balm to the optics may be a source of much inspiration—if one may believe all that gets into print. Still, if the truth be known in the case of this young man, he might have accomplished more for his employer if there had been no haired, ratted young creature across the way. For the sight of the girl across the way and concentration were things apart. The young man would look at the figure across the court when there were figures on paper right in front of him that he might have looked at. Once he was offered a better job with another firm, but he staid where he was for the sake of the view.

Don't get a wrong impression. It was not in a flirtatious spirit that the young man gazed absently across the court. The creature at the window opposite was not the kind that couldn't make her eyes behave. She had her lamps under perfect control. There was something about her that dispelled any notion one might have to get familiar without a formal introduction.

She had a sweetly serious countenance that made one think she must be a great help to her mother. There was something unusual about her. She had her soft lustrous hair propped up some with rats, it is true, but not to extremes. Her eyes were full of gentleness and she smiled often. Not at anybody, though—just smiled good humoredly as she took dictation or went ahead with her work.

The young man across the court dividing his attention between the two kinds of figures had never heard her voice, but he knew that it was soft and low and resonant. She didn't come to work with a different oufit on every day, either. But she always wore color combinations that seemed to have grown up together and her shirtwaists were wonderfully fresh and neat. That was one thing that appealed to the young man opposite. She looked like a girl who could make herself presentable without spending so much money that whoever started in to make out the checks would be obliged to quit going to a good tailor for his own clothes.

In the six months or more that the young man had been looking across the court at the features of his ideal, their eyes had never met squarely—not once. She would look over occasionally in a dreamy way, but when the two lines of vision were about to become coincident she would glance leisurely away. It was impossible for one to send any wireless, "Honest, I know you'd like me" message to her. "Pretty refreshing, too," the young man opposite told the boys in the office.

She wasn't going around making any chance acquaintances, but he was willing to bet that once a fellow got to know her real well she was the sort of a girl who would take a keen interest in him, would chide him for not wearing a vest on a cool evening when he might catch cold, and would notice every time he wore a new necktie. He went around thinking such thoughts as that all day long. It was a shame, he kept remarking, that a girl like that had to earn her own living and brush elbows with a sordid business world.

At last—and this was only ten days or so ago—he found himself in the realization of one of his fondest hopes. He met her! It happened out at the beach. She had gone out with her sister, and her sister's gentleman friend and this friend was acquainted with an old friend of our hero who was out there, and things worked out so that everybody was introduced all hands around. The young man of the window on the court and the creature of the window opposite strolled away to talk things over until the next dance should start up.

"I've saw you at the window a thousand times," she began. "Of course I never liked to rubber or nothin'. Maw always brought we girls up not to stare at no one, and the boss jest about throws a fit if he sees anybody in the office lookin' as if they wasn't 'tending strictly to bizz. I never have knew such a place to work. I'd have went to some other office long ago only the pay's pretty good and I need the cush."

Thus did she talk on, spreading bad grammer and bromides at every breath.

The young man danced with her silently and then excused himself. His illusion was so rudely shattered that he felt like a man who had been struck over the ear with a paving brick. Next week he is going to have his desk moved away from the window.

A GOOD LANDING.

"He always was a lucky fellow."

"What do you mean?"

"When he fell out of his airship, he plumped straight through the skylight of a hospital."—Woman's Home Companion.

KITCHEN HINTS.

To scald tomatoes easily, place them in a thin bag and dip in boiling water.

Chopped preserved ginger added to the sauce served with cottage pudding is a delicious accompaniment.

To give a very delicate scent, place a large piece of orris root in the water in which lingerie is washed.

To keep salt meat from molding, rub every fortnight with white of egg in which has been mixed a little salt.

A pallette knife is a great help in the kitchen ıor cleaning cake dough from the mixing bowl and for many other uses.

To get the best results from dried fruits, put to soak in warm water to which a generous pinch of salt has been added.

To clean and tighten cane seats soak them well in hot water and use soap if it is needed. Then dry in the open air.

A tasty dessert is made of squash or pumpkin prepared as for a pie. It is baked in a pudding dish like a baked custard.

If the cellar is dark, it is a good plan to have the bottom step painted white so that it can be seen in the dim light.

A little molasses put on the roosting place of the sparrows when they become a nuisance over the windows will drive them to other quarters.

SMILE A FEW AND BOOST A BIT.

Here! you discontented knocker
  Growlin' 'bout the country's ills,
Chloroform your dismal talker;
  Take a course of liver pills.
Stop yer durn ki-o-tee howlin',
  Chaw some sand an' git some grit;
Don't sit in the dumps a growlin',
  Smile a few,
    An' boost a bit.

Fall in while the band's a-playin',
  Ketch the step an' march along;
'Stead o' pessimistic brayin',
  Jine the hallelujah song;
Drop yer hammer—do some rootin',
  Grab a horn, you cuss, an' split
Every echo with yer tootin',
  Smile a few,
    An' boost a bit.

—Exchange.

A WIDOW'S BOY.

Nature made it very hard for us to keep from babying my son. All his early years he was a high-strung little semi-invalid. During that time I tried not to let the boy feel himself too important. I tried never to let him know that all my life was centred in his, or that I worried over him. I always assumed that his indisposition was slight and such as any other child might have. On no condition did any of us mention nerves. If anything annoyed him when he was in no condition to bear the excitement, the cause of his irritation was unobtrusively removed. We never discussed in his hearing his lack of appetite.

As he gradually grew into more normal boyhood, there was some change in our relationship. The child was ever shy and retiring, and wanted to stay always near me. Now, I fa pushed him into the arms of "the fellers." Many mothers make ar fuss over deciding with whom their boys shall associate. I let my soı for the most part, make his own choice. I made him understand th I trusted he would not become intimate with any boy who did not live up to our code of honor.

After paying two-thirds of his college expenses, my boy is now takin care of me. And is it necessary to say that I am a proud and happy mother?—Harper's Bazar.

CO-OPERATIVE LAUNDRY.

Another feature along the co-operative line which we cannot refrain from mentioning is the possibility of simplifying the work of the farm home by the establishment of co-operative laundries in connection with the co-operative creameries, where the hot water and the engine used in the forenoon in the creamery may be utilized one or two afternoons in the week, washing at least the heaviest and dirtiest clothes from the surrounding farms. Such a plant can be equipped at a much smaller cost than can a hay fork be placed in each of the barns in a community, and such a plant would be in use every week in the year.—Minnesota "Farm Library."

CLEANING WHITE CANVAS SHOES

With a clean cloth dipped in alcohol, remove the grass stains. Then, after the shoes are dry, rub magnesia thoroughly into the muddy spots and soiled places, leaving it on for an hour or so; then brush it all out and all of the dirt will come with it. Magnesia can be also used very effectively to clean the hem of white skirts that do not show any signs of dirt except soiled edge.

Extracted light amber	6½@7
Beeswax, per lb.	24@30

Hay.

Arrivals of hay during the week have been 5300 tons, being about the same as received during the last week. In the interior districts not much hay has changed hands lately. A great deal of hay that has been purchased during the last month by dealers for shipment to San Francisco has been brought into market and sold at a loss. Large quantities of hay that are in districts where storage is not available will have to come into this market.

There has not been much hay going forward for export account lately, although it is expected that this trade will be a little better shortly.

Alfalfa hay is higher, and the feeling thoroughly firm at the advance, for the reason that the Northern cities have sought our market for a large supply of this commodity for both present and future use.

Fancy wheat	12.50@13.00
No. 1 wheat or wh and o.	10.50@11.50
No. 2 wheat or wh and o.	9.00@10.00

Mixed feed, per ton	24.00@30.00
Shorts	24.00@26.00

Deciduous Market

Sacramento California, Aug. 13, 1910.

The following circular of the California Fruit Distributors gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, August 12th, 1910:

Peaches.

Two hundred and fifty four and one-half cars: Shipments of this variety held up better than was expected during the past week, but there will be a heavy decline next week Salways will begin moving in a limited way in a few days but there will be no shipments of consequence until the following week. About September 1st the heavy movement of Levy's clings will begin.

Plums:

Eighty nine and one-fourth cars: Plum shipments are decreasing daily and will continue to do so during the remainder of the season. There are a few Grand Duke, Hungarian and Kelsey still available.

Pears:

Twe hundred and twenty-six and one-fourth cars: Last week's shipment shows a decline in this variety and this will be found to be greater during the next seven days. There are a very few pears now available for the f.o.b. trade.

Grapes:

Two hundred and twenty-three and one-fourth cars: The grape movement is now fairly well under way. Movement consists principally of Malagas and Thompson Seedless, but Tokays from the earlier section are becoming fairly plentiful in the auction cars. It probably will be ten days to two weeks before we will have this variety to offer in quantity. Rose of Peru are just about ready to move and will be forwarded in a limited way during the coming week.

The weather has remained fine and all conditions are favorable to the perfect development of fruit.

ALMOND PRICES.

The following is from New York, August 5th:

Spot Tarragona almonds are firmer at 15¼c. A good deal of local interest is noted in best grades in spot California almonds. Prices by the California Almond Growers Ass'n selling agents are looked for in the next few weeks. There is a firm tone in cables on 1910 crop foreign almonds. California quoted N. Y. as follows. Nonpareil 17; Ne Plus 16 and Languedocs 12¾.

After a very interesting meeting of he representatives of the various associations of this Exchange in Sacramento yesterday the management and selling agents were authorized to quote out to the trade the Exchange almonds at the following prices:

Nonpareil	16½
I X L	15½
Ne Plus Ultra	14½
Peerless	13½
Drake's Seedlings	13
Languedoc	12
Hard Shells	8½

Other varieties will be handled at relative prices, the size and shape of he kernels and the percentage of kernel to shell being considered. These prices have been arrived at after the most careful and conservative gathering of statistics on the crop of this year both at home and in Europe, and the needs of the market. We have every reason to believe that these prices are justified this year and if so we should receive them. Let us see now what will become of the almonds outside of the Exchange.

Inspectors were selected at yesterday's meeting for the various receiving warehouses and we think everything will be in readiness to begin loading out cars by the first of September. It is doubtful if it would be advisable to start sooner. Bags were shipped from San Francisco the 11th to Lodi, Lancaster and Oakley; on the 12th to Davis, Esparto, Yuba City, Live Oak, Antelope, Fair Oaks and Paso Robles.

In sulphuring almonds be sure not to over-sulphur them. You can add more if you do not get enough but if you get too much you cannot get rid of the excess.

Let everyone work to make our output this year superior to anything that has gone out from California in the almond line. If you will do this we will surely get on the map for next year.—California Almond Growers Exchange. J. P. Dargitz, Secretary and Manager, Secramento, Cal., August 13th, 1910.

Citrus Market

LOS ANGELES, Aug. 17, 1910.

A material decrease in the number of cars going forward each day has helped to strengthen the Valencia market. The same conditions as to excess of small sizes still embarrass the market somewhat, but there can be no complaint of the general situation. Dry fruit from the frostier sections is a factor which has to be handled but is not proving as embarrassing as with the navels. Approximately there are 200 cars yet to go. With the more han two months of legitimate Valencia season the market will handle this amount at strong prices.

The warm weather given for the past four or five days in many parts of the East has cleaned up nearly every box of lemons on the market, and the few foreigns, together with the limited number going from this state are commanding satisfactory prices.

Shipments.

Total shipments of citrus fruit to date since November 1st, 1909, 28,350 cars of which 24,138 were oranges and ,212 lemons. To same date last season, 35,167 cars, of which 29,591 were oranges and 5,576 lemons.

NEW YORK, Monday, Aug. 15.—The market in oranges today showed an easier tone, the sales being made at prices that were 15c to 20c lower than previous sales. There was a good demand. Fifteen cars oranges sold. Market easier with lower prices. Cloudy and muggy.

Baby Chicks, Laying Hens, Pullets, Etc.

On hand every day of the year. Free 32-page catalog gives prices, descriptions, etc. We ship to every town in the West. Our prices are lower than any other dealer, as we buy more and sell on less margin of profit. We can fill orders for White and Brown Leghorn hens, 10 months old, Barred Rock, Rhode Island Red and Black Minorcas 10 months old. We have Black Minorca, Rhode Island Red and Buff Orpington pullets 2, 3 and sometimes older. Send today for catalog. State what yo wish—kind, age and quality, and we can name the price.
We can fill orders for Reds and Barred Rock chicks ever Tuesday at present.

Pioneer Hatchery Co., 112 E. 8th, Los Angeles

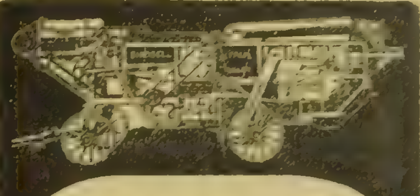
BIRDS OF CALIFORNIA.

The Department, having concluded its investigations as to the harmful or beneficial effect of California birds upon the fruit industry of that State. has issued the second and final part of its report in Bulletin No. 34 of the Biological Survey. Seventy species of the feathered denizens, among them some of the most important birds of the state from the farmers' and fruit growers' standpoint, were systematically investigated. It is true that many of them have not been charged with the destruction or injury of fruit or any other farm product, but as almost all destroy great numbers of harmful insects, or devour seeds of noxious weeds, they are important as a factor in farm economics and the aim has been to collect all data possible on the food of the several species, so that a just verdict might be rendered as to the birds' economic relations.

Few birds are always and everywhere so destructive that their extermination can be urged on sound economic principles; some, like the swallows, swifts, wrens, and chickadees are so strictly insectivorous that they are exceedingly beneficial, while others may injure crops at certain times of the year, but the loss is exceedingly small, and if by its insectivorous habits the bird prevents much greater destruction than it inflicts, the farmer should be willing to bear the lesser loss.

A reasonable way of viewing the relation of birds to the farmer is to consider them as servants, employed to destroy weeds and insects, for whom sufficient food and needed protection is generously provided. In the long run, no part of the capital invested in the farm or orchard is more certain to pay big interest than the small sum collected as toll by the birds that harbor near the premises. Deductions from the extensive investigations undertaken in response to numerous complaints concerning depredations by birds in orchards and vineyards on the Pacific Coast, show that the food habits of the seventy species, whose stomach contents were under examination, indicate that but four species common in California can be regarded as of doubtful utility. These are the linnet, California jay, stellar jay, and redbreasted sapsucker. Therefore, when all the known methods of protecting fruit have been exhausted, or can not be profitably employed, a reasonable reduction of the numbers of these offending birds is permissible; but the more the food habits of birds are studied, the more evident is the fact that with a normal distribution of species and a fair supply of natural food, the damage to agricultural products by birds is small as compared with the benefit.

It is bad to thrash a horse to make him increase his speed. Put the whip into the manger.



SAVE YOUR ALFALFA SEED

We continue to warn Farmers that 25 per cent. of their Alfalfa Seed is wasted when the ordinary grain separator is used for threshing.

IT IS VALUABLE

Alfalfa Seed is being imported into this country every year because the Western Farmer does not produce enough seed to supply the demand. With the prevailing high prices of seed you cannot afford to have your seed wasted in threshing. We build the only machine in the world constructed especially for hulling Alfalfa Seed. If your thresherman does not have a "Birdsell" Alfalfa Huller give us his name and address and we will send him our Catalog and you shall have our 1910 and 1911 calendar in colors.

OUR ALFALFA BOOKLET—FREE

This booklet contains 48 pages and was written by an Alfalfa Specialist. If you are not raising Alfalfa send for this book. He tells you how to start a crop, raise and harvest it. Every man should have this booklet. Write today.

BIRDSELL MFG. CO.
SOUTH BEND, IND.

EIGHT ADVANTAGES OF SILO.

Missouri State Experiment Station summarizes the value of the silo as follows:

1. Silage keeps young stock thrifty and growing all winter.

2. It produces fat beef more cheaply than does dry feed.

3. It enables cows to produce milk and butter more economically.

4. Silage is more conveniently handled than dry fodder.

5. The silo prevents waste of corn stalks in the manure when silage is fed.

6. The silo will make palatable food of stuff that would not otherwise be eaten.

7. It enables the farmer to preserve food which matures at a rainy time of the year, when drying would be next to impossible.

8. It is the most economical method of supplying food for the stock during the hot, dry periods in summer, when the pasture is short.

Business Notes

BEAUTIFUL CATALOGUE.

The catalogue of the Brownsberger Commercial College is one of the most pretentious books of its kind we have seen issued. It is filled with large engravings of scenes of the school and the garden about it. With these of course, is the matter descriptive of the various departments of the college which aims to give a complete business education to all who attend. Any young person having a desire to learn more of a thoroughly up-to-date commercial college should write Mrs. Florida Brownsberger, President, 953-957 West 7th St., Los Angeles Cal.

of this paper are all familiar with the alphabet—A, B, C, D, etc.—but how many, if any, know this same old alphabet numerically?

For instance, the letter "L" is the 12th, "I" is the 9th, "S" is the 19th, and so on.

Children know the alphabet numerically better than "grown-ups." All should become familiar with the relative numerical positions of the different letters.

In order thoroughly to advertise one of "THE AMERICAN WEEKLY'S" strongest and most forceful mottoes, we have spelled it out, using numbers in the small squares instead of letters. Can you work out this motto? We have omitted the numbers in three of the squares marked "?," and you must supply this letter to make correct reading, when reduced by you to words, making the motto. There are five words in the motto.

Can you solve it? If so, you can share in the valuable prizes we will give.

A few minutes spent in working out the numerical alphabet, spelling out and forming into words this motto, is a harmless form of amusement as well as educational, and also gives you a chance to win a cash prize at NO COST TO YOURSELF.

The Prizes To the persons sending us the best and neatest correct solutions to this numerical-alphabetical puzzle we will give, ABSOLUTELY FREE, the above prizes in the order named. The decision will rest with the editor of "THE AMERICAN WEEKLY" and his decision will be final. There is no possible catch to this advertisement. We mean EXACTLY WHAT WE SAY.

Why We Do This This offer is made by "THE AMERICAN WEEKLY" of the San Francisco Examiner. It is absolutely unrestricted. There are no conditions but this: The best and neatest answers win.

Reason for the offer? Of course, there's a reason. "THE AMERICAN WEEKLY," which is the best weekly newspaper in the United States, combining as it does all the features of a newspaper and a high-class magazine, wishes to make itself known to half a million more people. And a good way to make their acquaintance is to give away money.

Best in the U. S. "THE AMERICAN WEEKLY" is unique in the weekly newspaper field. It combines all the features of the daily newspaper and magazine—the farm journal, poultry paper and woman's magazine all in one. Eighteen big pages every week, equal to six magazines every issue.

THIS CONTEST CLOSES SEPTEMBER 30, and no letters bearing postmark after that date will be considered. Prizes will be awarded **OCTOBER 5th** and the winners will be notified by mail.

Address your solutions to

California Cultivator

Vol. XXXV—No. 8 Los Angeles, California, Thursday August 25, 1910 Subscription $1 a Year

Resources of the Agricultural Sections of Arizona.

Written for The Cultivator by Harry Welch, Secretary Phoenix Board of Trade.

ARIZONA has long been considered a section having the typically wild and wooly conditions of the border. To the minds of many the name has conveyed the impression of worthless hills and deserts. It may have been granted that there were here and there little productive nooks, but of such small extent that they could not overbalance the vast stretches of worthlessness. True, it was conceded that in the matter of scenery Arizona is the peer of any other section in the world, but while scenery is attractive to the tourist, it counts for less with the settler who wishes a home in a section which has wealth enough to supply not only the necessities, but some at least of the luxuries of life.

IRRIGATING AN OLIVE GROVE IN THE SALT RIVER VALLEY.

THE DATE PALM IN ARIZONA.

Four Factors.

To supply these, soil, water, climate, and the markets are the four cardinal points, and as they exist in the Salt River Valley of Arizona, insure its continued prosperity. In that valley there are 200,000 acres which may be irrigated by the waters held in the Roosevelt Dam. In addition there are 40,000 acres which may be irrigated by pumping. The power for this pumping may be secured by a system of power and irrigation lines all connected with the dam. Arrangements for utilizing this power have been made, and after supplying the required amount of electricity for pumping, there will still be 10,000 horsepower surplus which will be a great factor in adding to the convenience and comfort of the ideal farming community which is sure to spring up in that rich valley. There will be lights for barns and stables as well as for the homes, and the farm motor for feed cutting and work about the house will be a regular factor. Even traction lines are contemplated which will handle produce in a most economical way. The more enthusiastic maintain that the advantages of city life will be extended to the rural resident in the Salt River Valley.

The soil is the finest in the world. It has been compared to the rich delta lands of Egypt, to the black lands of Russia, and to the rich "polders" of Holland. There are now in cultivation over 150,000 of these rich acres, and this area is being increased rapidly as settlers from all parts of the United States learn of the opportunities for wealth to be found here. It is predicted that within a very short time 24,000 acres more will be crop producing.

Productions.

The staple crop is alfalfa, of which there is now growing over 75,000 acres. About half as much acreage is now producing barley. The alfalfa yields six to eight tons to the acre and the present price is about eleven dollars per ton. This gives ideal conditions for a dairying community, and a dairying community is invariably a rich one. Dairymen in this section have netted seventy dollars a year from dairy cows, this not counting the increase in stock. The farm unit is 160 acres at most, and no person will be supplied with water for more than this acreage. The tendency is toward smaller farms, the average being 80 acres.

Besides the regular dairies, great numbers of cattle are shipped in every year for fattening; there are over 24,000 there now. In addition there are brought in for shearing and lambing each year over 500,000 sheep, and one of our principal outputs is horses.

Sugar beets are extensively planted. This, with many other Arizona crops, beats the world for earliness. This year 25,000 tons of beets went through the factory, and the season was closed by July 21st. The average yield is 21 tons to the acre. One 80 acre ranch in the valley netted this year $55 per acre.

Fruits.

There are about 2000 acres in orange groves, about one-half being now in bearing. The fruit ripens exceptionally early and is all in the New York markets before Christmas where it has sold for an average of $5.10 per box. A very few lemons and grapefruit are bearing and have proven very profitable. Olives are a standard and an 80 acre orchard netted last year sixty dollars an acre. These lands suitable for orange and olive culture may be had at $200 per acre and equivalent prices govern sale of lands suitable for other fruits. It may be noted in passing that the date thrives exceptionally well, some of the experimental plantings giving bunches of ripe fruits weighing above 30 pounds.

In the valley there are approximately 3000 acres of fruits other than oranges. Besides the olives, there are peaches, apricots, and all kinds of deciduous fruits, together with grapes which have proven remarkably profitable early shippers. Berries are also beginning to be profitable. Melon raising has developed into a great industry and some of the finest in the world are shipped.

A Unique Industry.

In one industry the valley stands almost alone as to American production, that is, the raising of ostriches. In this Arizona is having a success equaling if not exceeding that of the home of the industry, South Africa. There are more birds on the ranches around Phoenix than in all the rest of the United States. We have over 7,000 ostriches in this valley, and the feather maker is thoroughly at home. Some astonishing figures show the profit in the industry. Estimates run from $25 a year per bird up to three or more times that amount. The advantage given by our climate is such that no protection is required, and the birds live in the open the year around. Ostriches at a very low estimate are valued at $400 per pair and their principal feed is alfalfa.

PLANT PHYSIOLOGY.

WHEN walking through an orange grove, one can usually gather much concerning the condition of the grove from the appearance of the leaves. If a branch is diseased, or if the roots are affected, the leaves will testify to the diseased state, either by falling, or by their abnormal color or size. There is a close relation between the leaf and the vital activities of the plant, so that any condition that affects the latter is soon visible in the former.

The vital activities of the plant are those processes by means of which life is maintained in the plant body.

Transpiration.

The roots absorb the water from the soil; it is carried up through the plant body, and all except a portion that is utilized evaporates from the plant through small openings known as stomates or breathing pores. Hence transpiration is mainly effected by the leaves.

Respiration.

Oxygen is also absorbed from the air through these stomates; and chemical compounds within the plant are oxidized and broken down, and energy is liberated; the waste product, carbon dioxide, being liberated from the plants through the stomates. Hence respiration is mainly effected by the leaves. This is similar to respiration in animals.

Photosynthesis.

Carbon dioxide is also absorbed from the air through the stomates; water is absorbed by the plants through the roots; the sunlight shining upon the green coloring matter of the plant, known as chlorophyll, causes it to unite the water and carbon dioxide forming sugar or starch; and the waste product, oxygen, is liberated from the plant through the stomates. Photosynthesis is mainly effected by the leaves.

It will be noted that respiration and photosynthesis are exactly opposite processes; the former tears down the plant food and thus liberates energy; the latter builds up plant food and thus stores up energy. Respiration goes on at all times; photosynthesis only during the daytime.

Growth.

Raw food materials, mostly mineral salts, are absorbed from the soil; some of these are united with the sugar or starch formed during photosynthesis, and new living matter (known as protoplasm) is formed. The materials for growth are worked up mainly in the leaves. Hence the leaves take the chief part in nearly all the vital activities of the plant.

Root Disturbances.

In times of drouth the leaves are the first to show the lessened supply of moisture. They wilt and fall. This reduction of its evaporating surface enables the plant to equalize the amount of moisture given off by transpiration to the amount supplied by the roots. The same thing happens when the soil solution becomes so concentrated, from the presence of soluble salts, that the roots are unable to absorb the water, or when the roots are killed by poisonous salts such as bluestone, or when the roots are cut, from too deep cultivation.

The first effect of plant starvation due to the absence of soluble plant-food in the soil is shown in the leaves. They become yellowish in color and are undersized.

Branch Disturbances.

The best example of branch disturbances as affecting the leaves is withertip poisoning. The withertip fungus, when growing in a live branch, secretes a poison that spreads to the leaves, causing them to become of a sickly yellow color. Later the branches become defoliated and die from the tip backward.

Leaf Disturbances.

The leaves may show local injury from insects, fungi, spraying mixtures, or what are presumed to be physiological troubles. Too strong solutions of sprays, such as whale-oil soap or Bordeaux mixtures may cause leaf injury. The insects that injure the foliage may be divided into two classes—the biting insects and the sucking insects. Amongst the biting insects are the grasshoppers and the orange dogs. Both of these do much harm, especially to young trees, by chewing the leaves.

Amongst the sucking mites and insects the injury done to the leaf by the red spider, the purple scale, and the whitefly may be mentioned. The red spider causes a yellowish spotted appearance of the leaves, accompanied by a crimping and stunting if they happen to be young. The purple scale causes a yellowing of the leaves at the spots where the scales are attached. When present in large numbers they may injure the leaf to such an extent that it will fall.

The whitefly larvae are the most dreaded enemies of all. Living on the under surface of the leaves, they suck much juice from them. In addition they excrete honey-dew, which falls on the upper surface of the leaves below, and serves for the development of a fungus known as the sooty mold. The sooty mold forms a black mantle over the surface of the leaf, so that very little light can reach it. Since light is necessary for the vital activity known as photosynthesis, very little sugar or starch can be formed. Hence the plant is starved, and as there will not be much sugar available for the fruits, they have an insipid flavor. And since sugar is also necessary for the formation of the living matter (protoplasm) the growth of the tree is affected injuriously.

There are several diseases either due to physiological or unknown causes that affect the leaves. Perhaps the most important of these is the yellow spotting, which is confined to the leaves. This disease produces spots a fraction of an inch or more across that extend through the substance of the leaf. The structure of the leaf is so modified that all of its vital activities are affected. As a result the plant is much weakened. This allows the withertip fungus to attack the branches, from which further injury results.

Mr. Orchardist

I do not advise a complete analysis of your soil. This is the work that is responsible for the doubt now cast on the value of soil analysis. I will determine the

Chlorine, Alkali,
Total Soluble Salts,
Phosphoric Acid,
Potash, Lime, Magnesia,
Adequacy or Inadequacy
of Humas and Nitrates;

and these determinations will have reference to the materials now subject to the use of the plants. I will also give a mechanical analysis of the soil. This is all that is necessary to know for practical purposes and is much cheaper than a complete analysis. If the orchardists realized the profitableness of this information to them, everyone would want this work done at once.

R. R. Snowden
Chemist and Soil Engineer

All Kinds of Oil Storage Tanks.

Melanose also attacks the leaves, as well as the twigs and fruits. It is not so harmful to the leaves as is the yellow spotting, though harmful in the same manner. In severe cases it may cause the leaves to fall.

Frenching is another leaf trouble. The only symptom of this disease is a lack of green color between the veins of the leaf. Without the green, this part of the leaf cannot manufacture sugar and starch; hence in cases where the frenching is severe, the tree will be weakened from this cause.

Withertip.

Is the withertip fungus injuring your grove? If so, now is the time pruning should be done. The dead and diseased branches if left on the tree will be a source of infection later in the year. Bloom dropping is caused by this fungus which "lives over the winter in the leaves, or in the twigs of the tree, or on fallen fruit. From these sources some of the spores find their way to an open bud, where the fungus grows very rapidly and produces myriads of spores. Bees, flies and other honey-loving insects, visit the affected blossoms, and coming into contact with the fresh spores, not only carry them on their bodies to almost every open blossom on the tree, but in crawling over the unopened buds they convey the spores to these as well. But worse still, the insects which have visited an infected tree carry the spores to other trees in the grove, and from these secondary infections, numerous other infections occur in time; so that hundreds of other trees that were free from the withertip fungus may become infected from one single tree with diseased blossoms."—Florida Agriculturist.

FIBERLESS MANGO.

The arrival in the market of the Cecil mango marks another triumph for the fruit king, in this section.

The new mango, like its big cousin, the Mulgoba, is free from fibre, has no turpentine flavor and it possesses a small seed.

The skin of the fruit is nearly an olive green, in color, free from spots and almost silky in texture. The flesh is firm, has the consistency of a well-ripened pear and can be sliced as easily as a banana. The large size of the new mango and its good shape make it possible to cut attractively for table use.

It was noticed yesterday that several people purchased the mangoes to get the seed for planting. This proceeding is not a bad one if the grower has no expectation of its coming true to type. Very rarely mango seedlings do have the characteristics of the parent tree and the chance is not a very risky one to take. However, the evolution of the fruit is being brought about by intelligent cultivation. Several growers in this section are acting the part of a Luther Burbank to the mango and the avocado and already the results of their work are showing up in a promising way.

From the stringy, yellow tar tasting little nubbin of the wild fruit to the fiberless, creamy, peach flavored product of its educated relatives is a long step, but considering the short time that the mango has been in cultivation in the county, the presence of the fine varieties here is something surprising.

To those who find the turpentine flavor not unpleasant, the well known variety called No. 11 is a great favorite. These ship well too, and are known in the Northern markets. But the time when the delicious Mulgoba and the Cecil mango are plentiful will be looked forward to with pleasure. Those on the market yesterday sold at 25 cents each.

These will doubtless be planted commonly for door yard decoration as there is no prettier shade tree in South Florida than the mango tree—and with the promising yield each year of fine fruit should be set out in generous numbers.—Miami, Florida, Metropolis.

DESTROY THE WEEDS.

Ditch banks, road sides, fence rows, and neglected corners are now in too many cases a perfect jungle of ragweeds, sunflowers, giant marsh elders and other members of the weed tribe. If left for a week or ten days too long, they will have ripened a full crop of seeds and scattered a large part on the ground.

Ditch banks are especially favorite places for weeds, and if neglected now they will soon have sown their seeds in the most favorable places to have them carried to every part of the irrigated fields later on.

This is the critical time, therefore, to act. Mow the weeds now; let them lie until dry enough to burn; then fire them when there is no danger from the fire.

If left until spring, as is commonly the case, but few of the seeds are destroyed by burning the old weeds, as they have been scattered long before and are often protected from the flames by a layer of soil.—B. O. Longyear, Colorado Agricultural College.

The first we know of the navel orange, which is very valuable not only on account of its fine quality and taste, but also because of its being seedless, is of a single tree that was found growing on the northern shore of the Mediterranean sea. This was about the year 1565, or nearly 350 years ago. A monk in a monastery in that far away country painted a picture of the fruit and wrote a description of it, both of which may be seen in the library of the Roman Catholic University at Washington, D. C. Grafts of this tree were taken to Spain by the Moors several hundred years ago and from Spain the trees were carried to South America by the Spaniards.—Coleman's Rural.

A FRONT GATE.

Doesn't it always make you a little "out of sorts" to enter the grounds of a good farmer through a rickety old gate that must be held up while it is being dragged open? A day's work, with a barrel of cement, two barrels of sand and four barrels of gravel will make two big, strong cement posts for a wagon gate, and make them of such size that they will hold a substantial wooden or wire gate. Such posts will not sag, will not rot or burn out, and will have a much neater appearance for a gateway than do the out-of-date, rapidly decaying wooden posts. A neat, easily opened front gate adds much to the appearance of thrift about a farm, and increases the pleasure of living. What kind of a gate have you?—Fruit Grower.

Deciduous Fruit Culture

APPLE CROP ESTIMATE.

SECRETARY C. P. Rothwell made the following report as to the condition of the apple crop in the United States and Canada August 1, 1910, as compared with August 1, 1909, at the annual convention of the International Apple Shippers' Association:

"An examination of this report for the first or New England group shows an increase in the entire section, except the unimportant state of Rhode Island, and for the whole group the entire crop this year promises to be about forty per cent in excess of last year.

"The central group, which is the largest producing group, shows increases in Ohio, Delaware and New Jersey over last year; Pennsylvania, Michigan and Wisconsin show considerable decline, with the increases not being sufficient to offset the shortage, and this group shows a decline from last year of five to ten per cent.

"The Middle West, or Ben Davis Group, shows the crop quite differently distributed from a year ago, Illinois, Nebraska and Iowa showing considerable decrease, with Arkansas, Kansas and Indiana showing considerable increase, and for this entire group gains substantially offset losses so that the present prospects promise a crop practically equal to one year ago.

Southern group.—The important state of Virginia shows a very decided increase over last year, with considerable increase in West Virginia and Kentucky, Maryland alone showing any decrease in this group; therefore this group will show an increase of fully fifty per cent over one year ago.

"Pacific group, or box Apple district, and Colorado show a decline in but one important state, Colorado, with a heavy increase in Washington and Oregon, and a heavy increase in the less important states of Idaho and Utah, with the important state of California showing a moderate increase of fifteen per cent, and for this whole group an increase of fifty per cent over one year ago is promised.

"Canada, not including the province of Nova Scotia, shows a decline over a year ago, early varieties promising relatively better than winter varieties. The Nova Scotia district promised, until recently, a good crop, but a very heavy drop followed shortly after setting time and present prospects are now for a light crop, poor quality and not to exceed forty per cent of a year ago in quantity.

"Upon the important question of quality, the quality is decidedly better than one year ago; New England, New York, Pennsylvania and Ohio all promise much better quality than a year ago, as does all of the southern group, while the Pacific group promises exceptionally good quality for the entire group, which will be the heaviest ever harvested.

"The Middle West, or Ben Davis group, ranges from poor to good quality, with a considerable portion of it with only fair quality. If present prospects are maintained until harvest time our country will have plenty of apples, all of better than average quality, which should have a good consumptive outlet at moderate prices to the consuming public."

Percentage indicates comparison with the 1909 yield.

GREEK CURRANTS.

Mr. Geo. Robertson, Statistician of Fresno county, reports:

"It is stated in the newspapers of yesterday and today that the California Farmers' Union has received from its New York agent a letter stating that its correspondent at Patras, Greece, estimates the new currant crop at 14,500 tons, and the holdover at about 15,000 tons, which in their opinion is not sufficient to supply the demand of the world. On the face of it, these figures are impossible and misleading.

"There are 150,000 acres of currants in Greece, and during the last seven years the crop has varied from 135,000 tons in 1906, to 185,000 tons in 1908, and the quantity exported during that period has averaged between 115,000 tons and 125,000 tons.

"The Spanish raisin crop is below the average, and Smyrna Sultanas are also reported short. I expect to be in a position to give a preliminary statement regarding these crops within the next two weeks.

"I am making arrangement that will enable me to issue regular bulletins to the local press, from time to time, regarding the size and condition of the various crops which this county produces, for the information of growers, and others interested.

"These bulletins will include statistics regarding the foreign crops of raisins, oranges, lemons, peaches, grapes, olives, wine, etc., and also reports from other states which produce these fruits.

"It will take considerable time to organize and develop a regular system on these lines, and this year I am greatly handicapped by commencing late in the season.

"Later on, complete reports will be prepared covering the ground on all products and manufactures, and giving statistics on oil, minerals, county finance, taxation and other matters usually dealt with in the statistical reports issued in other states and countries, where figures on these subejcts have been found by experience to be indispensable."

PEACH STUDIES.

A very full and comprehensive study of peaches now grown in California and of varieties of this fruit that might, with profit, be grown here, was begun at the University Farm, Davis, in the spring of 1908. The points to be determined by this study are: First.—The standardization of the best of the varieties now grown in the state, so that representatives of the very best types of the varieties in question may be at all times available for propagation for comparison and for purposes of determination. Second—The illustration of the most desirable cultural methods and ways of pruning these standard varieties. Third—Best methods of handling the product of these well known varieties. Fourth—The development of peach varieties that are not now grown in California, but which may prove of value here, possibly supplanting some of the now popular varieties.

For the purpose of this study eighteen of the best known varieties have been planted in blocks of from ten to twenty-five. These plantings include those varieties that ripen early in the season and through the midsummer ripeners to those that are available very late in the year. Continuous observation of varieties of peaches is thus provided for and a determination of the first three points of this study made possible.

For the furtherance of the study of the fourth point noted there have been planted seventy-three varieties of peaches not now grown in California, but which have proved more or less valuable in other peach growing states. These varieties are represented in groups of from two to four of each kind. The outcome of these studies will be either the addition of valuable varieties to those now available in California, or the discarding of many as being of no value here. As an additional point in this fourth item new varieties are being developed as seedlings, cross fertilizing of known and valued varieties being practiced in the production of these seedlings.

HARVESTING THE FIG CROP.

Late advices from the fig-growing centers of the San Joaquin Valley are to the effect that the crop is about eight to ten per cent short, and all sold from growers' hands, and from packers' hands to the trade. The crop was cleaned up last spring before buyers in other lines had become active to any extent. Prices ranged from 2½ cents per pound to as high as 3½ cents, though very few figs were bought so high, this figure coming at the very clean-up. Probably 85 per cent of the crop sold for 2½, and the remainder at 3, 3¼ and 3½.

Packers now state that the question of a future market is largely up to the grower. The prices of this season were the best, on the average, paid within the past twelve years. This was partly owing to the short crop. While nothing like this for succeeding seasons is promised, packers do state that if the growers take proper care in packing and handling their crop, so as to maintain a good standard of quality for the goods, a profitable market for the future seems assured.

That portion of the crop grown in the drier regions of the valley where irrigation was not resorted to suffered some from sunburn, but that does not occur on lands irrigated. As a consequence there is a lack of foliage on the former trees and the side of the fig which is exposed to the sun has a thick skin. The size of the crop is estimated as follows: 3,500 tons of Wite Adriatic figs, 700 tons Mission or California Black figs and 300 tons of Calimyrnas.

"The pure food law has made impossible in the last few years the shipping of the poor grade of goods once handled as cooking figs. Now, these are good for hog or horse feed, and very little else. But, it is a good thing for California figs."

SULPHURING ALMONDS.

The California Almond Growers Exchange sends out the following regarding almond sulphuring:

"The softer the shell and the lighter the color naturally, the less sulphur. The heavier the shell and the darker the color the more sulphur is required. For a house holding from 400 to 500 pounds on suitable trays with slat bottoms, two pounds of sulphur burned with the house closed about 15 to 30 minutes for paper shells. Increase sulphur and time about 50 per cent for other than paper shells. Be sure your almonds are thoroughly dry first. The test is such a condition of the kernel that it will break but not bend. If in any doubt shell one here and there to prove it. Then dip them in water very quickly, or spray them with water to dampen the shell; or put them in your sulphur house and subject them to wet steam at not over 15 to 20 pounds pressure for 30 minutes and then you are ready to burn the sulphur. If you have steamed them you can sack them as soon as taken from the sulphur house. If the spraying has been just properly done you can do the same. If they have been dipped you will need to dry them well before sacking. If in doubt be sure and dry them. Of course where your association is going to do the bleaching you will not need to bother yourself about it."

Strong, Vigorous and Thrifty Walnut Trees

Well grown, true to name, and ready for immediate planting; of the New and Popular Variety, the

Placentia Perfection Walnut

A prolific and regular bearer of large, meaty, fine-flavored nuts, commanding from 2½c to 5c per pound more than the ordinary soft shells.

Choice trees, 3 to 14 feet, from 20c each and up; special low prices on lots of 200 and over. If contemplating planting a walnut grove, it will be to your interest to correspond with us at once, as the stock is limited and the price sufficiently attractive to clean it out quick.

SOIL CONVENTION.

An important soil convention will be held in Los Angeles, October 3 to 8. Dr. Cyril G. Hopkins and Dr. F. H. King, noted soil experts from the East will investigate soil conditions in Southern California and lecture before the convention.

Realizing that the subject of soil fertility and soil management are the most absorbing problems that confront California fruit growers and agriculturists today, the University of California, through its Southern Laboratory at Whittier, has succeeded in attracting two of the best men in the East to study our soil conditions and give our growers the benefit of the very latest expert knowledge upon the subject.

Dr. Cyril G. Hopkins, head of the Department of Soils of the University of Illinois, has a world-wide reputation for his work on soil chemistry and plant foods. He is the author of an exhaustive work on Soil Fertility. After a short survey of the soils of Southern California, Dr. Hopkins will deliver five illustrated lectures upon the conservation of plant food and rational methods of fertilization.

Dr. F. H. King, formerly of the University of Wisconsin, holds an international reputation as a soil physicist. He is the author of several widely used text-books, such as "The Soil" and "Physics of Agriculture." His studies in Southern California will be devoted to the physical condition of our soils and irrigation and tillage practices. In five lectures before the convention he will discuss our methods, pointing out any prominent errors, and helping the grower to a better understanding of how he should use water, cover crops and other means for bettering the physical condition of his soil. Ample opportunity will be given for discussions after each lecture.

In addition to the above, there will be lectures by Professor J. H. Norton on the soil studies being carried on at the Riverside Station, and by Dr. Lipman of Berkeley, on soil bacteriology, and by others to be announced later.

The idea from the first has been to furnish a grand symposium on California soils, presented in such a way that our growers can secure the very latest information which scientific research has contributed to the subject.

All persons interested in the production of crops from the soil are urged to attend. The dates are October 3 to 8 inclusive. The place, Chamber of Commerce Building, Los Angeles.

FROST PROTECTION.

Reviewing the work in a recent Cultivator touching upon the frost question, Mr. Adams, Agricultural Editor of the S. F. Chronicle says:

"The California Cultivator devoted a great part of a recent issue to a symposium in respect to protection of fruit from frost. While this subject is of most importance to citrus growers whose products ripen in the winter, it is of vital interest to growers of early blossoming deciduous fruits, especially apricots and almonds. This article is very timely, for if growers do not consider the subject until cold weather is upon them, it will be too late to save the crop. This subject has been studied in various parts of the country and we now have the experience of twelve or fifteen years. Without reference to the measures which have been tried and abandoned as ineffective, it is sufficient to say that the only effective way is to light fires enough to warm the air surrounding the orchard. There are no frosts on windy nights, and it is theoretically possible to install power ventilating plants of such capacity as to create a stiff breeze throughout the orchard and protect the fruit by the methods of nature. It is probably not commercially practicable. The earlier attempts in "smudging," as it was called, were weak and puttering. Twelve or fifteen fires to the acre will not do the business on a cold night. The resolute way to attack the problem is to install an oil pot or coal basket ready to light under each tree and then light as many as conditions require, saving, usually, at least twenty-five fires per acre to be quickly started just before sunrise, which is the most dangerous time. The oil pots or baskets are hung on tripods with oil saturated shavings ready to light. Firing should usually begin and be heaviest on the windward side. The more generally the owners of neighboring orchards unite in protection work the less it will cost each and the better the results. If oil pots are used, about one gallon of crude oil per pot will be required. If not used during the season the oil can be returned to the container and kept for the next year.

"If coal is used about twenty pounds per basket, or one ton to the acre, will be required. The use of crude oil is not favored for citrus fruits on account of the soot which it deposits on the fruit. The soot is of less and perhaps no consequence in the case of almonds and apricots. Orchards can be, and in Sicily are, protected by a covering of lattice work or cloth, but it costs too much and is no longer used in this country. Many small fires are better than a few large fires. Where wood is plenty and coal or oil not conveniently available, wood or brush, or sawdust and coal tar, shavings saturated with oil, pine needles, or whatever will best answer the purpose and can be got may be used. Any fuel will do which will sufficiently warm the orchard and not injure trees or fruit. The correspondents of the Cultivator differ in their estimates of the number of baskets per acre which must be installed, some putting it as low as fifty. But such experienced and successful growers as N. W. Blanchard of Santa Paula provide a coal basket under each tree at the approach of cold weather and light as many of them as are required. And if they never have to light any they are glad. It is also desirable to install thermographs in all orchards which with the use of the telephones now common in fruit growing districts will enable the growers to keep informed of conditions over wide areas and do team work in meeting them. The cost of all these installations must be considered part of the necessary investment in orchards in frosty places. Professor A. G. McAdie of the Weather Bureau does not consider the problem yet fully solved. In still nights the heat rises directly upward and most of it is lost. That is why such growers as Mr. Blanchard put a fire under every tree. Professor McAdie hopes for some combination of a heater with a blower which will give a better distribution of the heat."

Apple packers at Watsonville find that the shook delivered to them this season makes a box a quarter of an inch narrower than the standard heretofore maintained.

Malthoid Roofing

Now is the time to roof your building.
Don't wait until the rain starts
and you are inconvenienced
by working in the wet.
Do the work while the conditions are
favorable and save yourself the annoyance
and disagreeable duty of being
compelled to hurry a job that requires
care and attention.
No matter what kind of a roof
you have or what kind of a building
you own, you ought to see us
about your roof troubles.
Our roofing experience will help you.
We will show you the kind of a
roof you should have and the way
you should lay it and demonstrate to
your complete satisfaction that there
is no other roofing on the market
that will give you so good roof service
as Malthoid Roofing.

It's free

Send for it. A new and valuable book on the "Care of Roofing."

No matter what your experience has been or what roofing you have used, this book will enable you to take better care of it. Sent free.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries. and this, with experience of other workers, will make this department of greater value.

COW HEALTH.

By Mrs. Minna E. Sherman.

THE best authority tells us that both cows and horses gain close to half their bodily weight in the first twelve months of their lives. The importance of not stunting a calf's or colt's growth during the summer time must be remembered; it is so easy to forget them when out in the pasture fields. This time of year the first freshness has gone from the alfalfa, and flies are bad, so that the little ones that are just weaned, are often allowed to grow thin before it is discovered by the herdsmen. The weight of a horse when mature depends naturally on the breed. The weight of the mature cow in a great measure depends on her breeding, but it is safe to say for practical uses no cow should weigh less than eight hundred or more than fourteen hundred. There have been good cows that have fallen under or have exceeded these weights, but it is safe to draw the average at these points. There is little danger of alfalfa raised cows exceeding these weights, while there is great danger of the calves that are turned off skim milk at three months old to shift for themselves falling under weight.

California Grades.

I have been watching the common cows of California for some years and believe that most people who have observed them at all closely will agree with me that they are about two hundred pounds lighter than they were twenty years ago. The older dairymen in nearly every portion of the state agree with me in this. They also agree that these present cows are not much better than the older cows, but that they pay better owing to the lengthened out milking period, In former years the cows milked four, five or six months; now they milk ten to eleven months each year. Size in a cow means plenty of room for her bodily functions; it means good heart girth for a strong heart, and a good deep chest for lung room. Heart and lungs play an important part in handling and oxygenating the heavy flow of blood that swells the great milk veins of the modern dairy cow.

Curves.

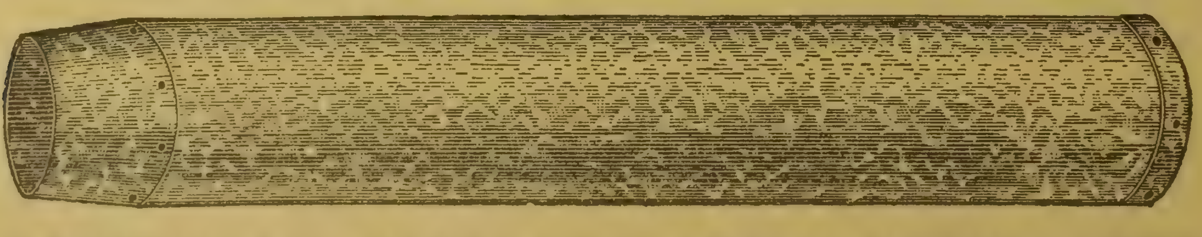
The four great dairy breeds may well be represented by a curve with the Jersey cow at one end and the Holstein at the other end. Next to the Jersey in bodily size and in richness of milk comes the Guernsey, with a larger frame, giving a little more milk a little less rich in butter fat. The most notable difference between them is the extremely high color of the Guernsey milk. Butter color is not needed in Guernsey butter at any time. These two breeds of cows can take care of a large amount of concentrated food in the shape of oil-cake and heavy grain ration without disturbing their digestions. Next comes the Ayrshire, a cow still larger, giving more milk, less rich in fat and able to care for a larger amount of rough feed. She is a hill climber, in spite of her size, and very active. At the other extreme from the Jersey we find the Holstein, a large, quiet, slow moving creature that can give quantities of milk of a low per cent of butter fat on a ration of green stuff without the use of any concentrated food to speak of. Alfalfa hay or green alfalfa or silage makes her a full meal. Now it can be seen from this that the cows best suited to the town lot are the cows that eat the concentrated foods and give the richer milk and are of smaller size, and it can be readily seen also that the dairyman will find his best returns from the breeds that fit into the feeds that he can most readily command.

Crossing.

The extreme difference in breeding makes even the crossing of high grades foolish, but if it is considered desirable to cross them, there is one rule that has been worked out in live stock breeding by careful observation. The larger animal should be on the male side if the best of acquired qualities are to be transmitted. The offspring of the male Jersey or Guernsey crossed on the female Holstein or Ayrshire is not worth as much as the reverse cross. The cross of the Brown Swiss on the Jersey produced in the first generation some good cows. The objection to crossing of breeds is not so noticeable in the first generation as in the second and third; the mongrel comes out rapidly in them. It is wise if the herd is a grade one to keep on breeding to the same breed of cattle until after four or five generations the mongrel tendency has passed away and the cattle are practically pure breed in their milking quality.

Selection.

The selecting by the eye of the good points of cows is not difficult in a bunch of common stock, but when it comes to selecting cows from a pure bred herd the difference is so slight that one may well hesitate and buy entirely on the blood lines represented in the individual. It seems a pity that the ordinary purchaser of stock does not learn that the word thoroughbred is never applied to cattle or swine. The breeder that is careless enough to advertise them



AMERICAN SURFACE IRRIGATION PIPE

SAVES WATER, GRADING AND TIME

The only scientifically constructed ***Surface Irrigation Pipe*** on the market. No round seams to leak, retard the flow of the water, or weaken the pipe. Cheaper than flumes. Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.

using this word is certainly not well up in stock, language and literature.

The only time the word thoroughbred should be used is in application to the running horse. Cattle, swine, and other live stock are pure bred, full bloods, or registered stock.—M. E. Sherman.

EXTERMINATING TICKS ON PASTURES.

The month of August lends itself well to the eradication of cattle fever ticks where a pasture rotation plan is used. By vacating a pasture during this month and keeping it vacant until July 1 of next year it may be freed of ticks, and if no tick infested animals are allowed to enter after July 1 the pasture will remain free.

Pastures from which live stock is removed for a sufficient time become free of ticks by a process of starvation, as the ticks can not live to maturity if they are unable to get upon animals. The time required for all ticks to die after the stock has been removed from infested fields and pastures varies considerably, depending on climate, season, and weather conditions. Experience has shown, however, that the period from September 1 to July 1 is sufficient, and this appears to be the most convenient time.

The advantage of vacating a pasture for the period named is twofold. Not only is the pasture freed from ticks, but its disuse during that time will probably cause less inconvenience and expense than at any other season, and it will be benefited by the rest and will have a better growth of grass the following summer. In some sections where pastures are utilized throughout the winter, to vacate would probably necessitate feeding the stock, unless the farmer is situated so that he can keep his stock on one pasture while another pasture is kept vacant. But it is also true that beginning with September there will be a more abundant supply of rough feed about a farm which can be utilized. August is a most favorable month for making a start toward freeing premises of ticks by the method suggested.

The animals should of course be free of ticks when they are again turned on the pasture in July. Where the owner has a small number of cattle, greasing or spraying them with Beaumont crude petroleum is a good way to rid them of ticks. When the number of cattle is large or when a dipping vat is convenient it may be more practicable to dip them.

COTTONSEED MEAL FOR HOGS.

A correspondent for the Rural World writes: "One of my southern customers has asked me for advice concerning the feeding of cottonseed meal to hogs. He lives in a cotton district and the meal is very cheap while corn is higher than in the corn belt. He also states that but little corn is raised and that grasses and forage crops are almost wholly unknown.

"I have had practically no experience whatever in feeding cottonseed meal to hogs. All that I ever fed was in a prepared feed that I used a few days. The result was the death of one of the best brood sows I ever owned. All that I can say will be from the experience and the experiments of others. The question might have been put to someone of the cotton belt, yet I believe that what I may say will be about the same as would have come from such source. It has been a matter of considerable experiment to determine the safest way to feed cottonseed meal. It seems to be the universal conclusion that while cottonseed meal is probably the cheapest feed on the list it cannot be safely fed by anybody who does not understand feeding it and even then there is great danger of losing the pigs. Some men claim that cottonseed meal can be fed safely to hogs for any length of time if not over a pound per day is fed.

"There arose an idea not long since that the product should be allowed to ferment before feeding. The result of demonstrations has led to prove that there is less danger in feeding the unfermented product."

THE DAIRY COW.

From Circular Issued by Dairyman's Co-operative Ass'n., Tulare.

Here is the foundation of your success in the dairy business. How many of us are keeping the dairy cow and no other? Of course on the feed and care given the herd depends a large portion of your profits, but feed and care will not make a good cow out of an animal that has a capacity of producing only 125 pounds butterfat per year. Did you ever stop to think that out of the odd 20,000,000 cows in the United States, the average cow produces only 130 lbs. butterfat per year, while again we have herds producing over 400 pounds of butterfat per year? Which do you prefer to keep, the 400-lb butterfat cow or the 130-lb? Of course the one that returns the most profit. What others have done you can do as well and probably a little better. I do not wish to advise you to sell your present herd and buy expensive animals from some of the registered herds, but what I wish to advise you to do is to test every individual cow and weed out and dispose of all that do not pay you a good profit.

Testing Your Cows.

The benefit that you derive from testing your herd is much greater than you would think, as you know then just what each cow is. There is no guess work about it. The Babcock tester never lies. Any ambitious and progressive dairyman should take pride in his herd. You would not for a moment think of buying a horse that would only do work enough to pay for feed, nor would you keep a man who could only do work enough to pay his board. Yet you are keeping cows that are actually running you in debt. This you may find to be a fact. With the Babcock test it is a very simple matter to tell what each cow is doing at any time. Whether you have one cow or one hundred you cannot afford to be without a tester. You can buy one for a few dollars, and by so doing may be able to save hundreds. Buy a Babcock test machine and go to your creamery and have one of the men there show you how to operate same, then you can test your whole milk, the skim milk from the separator, and also the cream you bring to the creamery.

When you have weeded out the poor cows from your herd, and you know what each cow is doing you are then in a position to do intelligent work in the line of breeding. Bear in mind the bull is half the herd, and should be looked after well, and do not let a few dollars prevent you from securing the best you can find. You will find it to be a good investment that will pay you in the end.

What I wish to bring out is the necessity of knowing each individual cow, and if she does not return you profit sell her—the sooner you get rid of such an animal the better. Go slow but keep everlastingly at it and you will win. Let your motto be: "Better cows, and a pure high grade cream."

After securing a herd of good cows, the next thing of vital importance is the care of your cream. What would you think of a man who has built up a fine dairy herd, secured the best bull he could find, gone to the expense of feeding, milking and caring for his cows, and then pay little or no attention to the care of his cream? Too often our dairymen seem to think that when they have the cream in the can that they have done well, and are willing to stop right there, and trust the Lord for the rest. If he had kept on a little longer and taken pains to have his cream thoroughly cooled and delivered at the creamery in the best possible condition his victory would have been complete.—David P. Johnson.

The lean pig and the young one, and plenty of his kind, are what the American public want. Juicy loins and fresh hams, chops that are not too fat, and frying pieces with little to suggest greasiness, are demanded; and it is identically what the producer can produce at most profit and in the least time.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.

Important!
Trinidad Lake asphalt is of vital importance to every roof. Lengthens its life. Saves time, labor, money.
Genasco
Ready Roofing
is made of Trinidad Lake asphalt. Doesn't crack, rot, or break. Gives lasting protection to your home, barn, and all other buildings.
The Kant-leak Kleet clamps seams water-tight without cement or large-headed nails. Makes laying easier than ever. Saves time. Protects against wind. Gives fine finish. Furnished in rolls of Genasco, when ordered.
Look for the trademark. Ask your dealer for Genasco. Mineral or smooth surface. Highest award, Seattle, 1909. Write for samples and the Good Roof Guide Book.

No Hoof, No Horse
U. S. statistics show that 80 per cent of all horses are lame and that 80 per cent of the lameness is caused by hard and contracted feet. As a hoof softener, toughener, nourisher and grower there is nothing equal to
Eshelman's Wool Fat Hoof Healer
A horse's hoof is from 60 to 70 per cent water. Grease and water will not mix. There is no grease about Wool Fat. It mixes readily with water, is very penetrating, and while a great medicine of itself, it also acts as a vehicle to carry to the afflicted parts the other medicinal properties of the HEALER. It is absorbed into the skin and gives natural stimulation and nourishment to the hoof. There is nothing that can compare with it for this purpose, nor as a remedy for contracted hoofs, split hoofs, quarter cracks, mud fever, corns, grease heels, and for all kinds of sores and cuts anywhere on any stock. If you have tried it, you know that this is true. If you have never tried it, it will surprise you with its power as a healer and restorer. It is not a new remedy, but has been on the market in the East for many years, where it has given the greatest satisfaction.
4 oz. package, 25c; 12 oz., 50c; 32 oz., $1.00; 5 lb. pail, $2.00; 10 lb. pail, $3.50. It is easy of application. Directions with each package.
TRIAL OFFER.
We will send you a 2-lb. can, use it 15 days, and if satisfactory, send us $1.00. If not, write us to that effect, and you need pay nothing. We take all the risk, you just try it. Send for it today.

Small Fruits and Vegetables

DENATURED ALCOHOL FROM CANTALOUPES.

INQUIRIES have recently come to the Chemical Department of this institution regarding the possibilities of denatured alcohol production from cantaloupes. In view of the above, a chemical examination was made of some dead ripe cantaloupes during the past season.

According to our present knowledge of alcohol, it is produced from what we call reducing sugars or like bodies having the same formula. These sugars we know in the commercial world as dextrose, grape sugar and glucose, all meaning the same material.

There are different yields per acre of cantaloupes in different parts of New Mexico, depending on different conditions of soil and cultivation and planting. There are also different varieties of cantaloupes produced which would contain varying amounts of fermentable material, but the difference in the amounts of sugars will not be very great in the different varieties.

The cantaloupes analyzed contained 3.5 per cent reducing sugars. This would mean 369.6 pounds of reducing sugars per acre producing 10,560 pounds of cantaloupes. If all these reducing sugars were fermentable completely to alchol, (which is doubtful) they would produce 179.26 pounds of absolute alcohol (100%), and this would make 29.88 gallons of 100% or 200 proof alcohol. At 40 cents per gallon 29.88 gallons would bring $11.95. The cost of production of the cantaloupes and the manufacture of the alcohol are next to be figured, but it is hardly worth while to figure on these when we know that corn will produce per acre alcohol valued at $35.24, sugar beets $69.76, potatoes $55.92, sweet potatoes $44.80, and tunas $55.60. Corn gives by-products in the manufacture of alcohol, while we know of no by-products from the cantaloupes.

Roughly speaking, 5 tons of cantaloupes will bring gross receipts from alcohol production amounting to $12; one ton produces $2.40 worth of alcohol. On an average yield of Rocky Ford cantaloupes an acre brings in from $150 to $200, when the cantaloupes are placed upon the market. Now if the cost of production of these is $17 per acre and it costs more to produce alcohol from an acre of cantaloupes, which brings in this way only $11.95, it is quite evident that the production of denatured alcohol from cantaloupes would not be a paying business but would be a loss.

After certain complicated treatment, sawdust and various other woody products may be made to yield reducing sugars which are fermentable to alcohol. At the present time it has not been learned if cantaloupes can be made to produce more alcohol eventually by this complicated treatment, hence the common method was used in these calculations. However, if it were possible to ferment all the solid material in cantaloupes, one acre would bring only $35.85 worth of alcohol, one ton would bring $7.20 worth; and, after deducting the cost of production of cantaloupes, one acre would net $18.85 from which the cost of manufacture must be taken, leaving a very small profit, if any.

Thus, in conclusion it is quite evident that it would not pay to grow cantaloupes for production of denatured alcohol; neither would it pay to manufacture denatured alcohol from the waste cantaloupes.—S. R. Mitchell, New Mexico Col. of Agr.

THE FAMILY GARDEN.

The one great secret in being successful with the family garden is to provide an abundance of plant food in a form readily available to the growing plants.

Stable and barn yard manure are the best fertilizers at all times. Some of the commercial plant foods are excellent in their place, especially when it is desired to force some of the early varieties of vegetables, but their use requires that the soil be in a high state of fertility and that the gardener have an expert knowledge of their uses and functions.

Constant cultivation should be the rule for this will keep the soil in an ideal physical condition for the roots to grow in, besides keeping the weeds in check. Cultivate early and persistently and keep ahead of the weeds.

Allowing the weed seeds to germinate and then quickly destroying them by frequent cultivation early in the growing season, will save a large amount of work during the summer.

Eliminate all the old fashioned beds and plant everything in long rows so that most of the cultivation can be done with a horse.

There need not be an unpleasant amount of hard hand work if properly worked with a horse and cultivator. Provide plenty of room at the ends to turn around with the horse while cultivating.

Do not plan a larger garden than you can keep clean and well tilled. A small garden will supply an abundance of small vegetables for a large family.

After the soil has been well enriched and well fitted we are ready to plant. If the plan has been well worked out all that is necessary is to plant each variety at the proper time in its right place.

The family garden must be planne to suit the needs of the family and two families will agree as to the amount and kinds of vegetables they will grow.

If we will study out the time it takes each crop to mature we may be enabled to plan other crops to take their place as soon as they are consumed.

A few crops like long blood beets, egg plants, melons, onions, peppers, winter squash and tomatoes require a whole season for their growth.—Journal of Agriculture.

Tomatoes need to be acclimatized. The best results can only be obtained from seed that has become well adapted to the conditions of the locality. If your favorite variety cannot be obtained from a seedsman in your region, it is better to select your own seed, provided you have the means of keeping the strain pure.

The proof of scientific farming is the crop.

The Ornamental Garden

PROPAGATION OF PLANTS.

PLANTS are propagated by numerous methods, all of which may be classed under two distinct headings: First, by seeds or spores; and second, by the vegetative method or "division of the plant."

In the propagation of plants by seeds the little embryo plant wrapped up in the seed case is the vital part concerned in the production of a new plant. In propagation by division, a living bud or tissue capable of forming a bud is the essential part. These may be secured either in the roots, stems, or leaves. Theoretically, any part of a plant containing living protoplasm should be capable of reproduction, but in practice the various parts of many plants have never been propagated successfully by any method of division.

Seeds are the results of the sexual union of two individuals usually, and the resulting plant cannot be considred as strictly a part of either one or both parents, and it does not necessarily resemble either parent. The new plant resulting from any of the methods of division may be regarded simply as a continuationof the growth of the parent under new surroundings and with few exceptions resembles it very closely.

Seeds are commonly used in the reproduction of annual and biennial plants, especially where the exact parental form is not absolutely essential, as in the cereals, forest trees, seedlings for grafting and budding, etc. Division is used with plants that produce seeds sparingly or not at all, as the horseradish, banana, seedless oranges, apples, etc. Some plants are more easily and cheaply propagated by division, and this is the method always used when the exact parental form is desired in the offspring as in our fruits and many ornamental trees, shrubs and flowers. Seed is most commonly used with the ordinary farm crops, and also many garden crops. The process of propagation by this method is fairly well understood. Modern horticulture is very largely dependent upon the reproduction of exact parental forms by various methods of division, the most important of which we will attempt to briefly describe in this paper.

The various processes treated in the following paragraphs may be likened to surgical operations and, while plants are less highly organized and less sensitive than animals, they are, nevertheless, living beings. Violent operations, when necessary, should be performed with this fact in mind. A good sharp instrument that will make a clean, smooth cut, should always be used, and needless injury and careless handling always avoided. The presence of at least one healthy bud in the part taken for propagation will always be found helpful and usually essential.

The methods of propagation by division naturally divide themselves into two classes. First, those in which the part selected for reproduction remains a part of the parent plant until roots and leaves are formed, or until the new plant becomes self-supporting. These are the simplest and easiest methods and are very largely employed. In the methods of the second class the parts to be used are cut away from the parent in the beginning and placed under conditions favorable to the formation of the parts necessary to make the new plant self-supporting, or favoring its union with a part of some other plant.

Division of the Crown.

The roots and root stalks of many plants develop a large number of buds or growing points. These are often taken up and divided into as many pieces as there are eyes or buds and each part treated as an independent plant. Familiar examples of such divisions may be seen in the common methods of multiplying rhubarb, asparagus, cannas, and many other perennial herbaceous plants.

Suckers.

Suckers are simply shoots that grow upwards from the roots or underground stems, forming young plants around the parent. The shoot, together with a piece of the root or stem from which it grows, is dug up and removed to a new position. The red raspberry and blackberry are usually propagated commercially from suckers. Some varieties of the cherry and plum are also multiplied to a limited extent by this method. The propagation of woody plants in this way usually results in an increased tendency to form suckers which often become seriously troublesome in cultivation. The production of suckers will usually be stimulated by any cutting of the roots or a severe top pruning. Sucker plants usually have a poor root system and make an unsatisfactory growth for the first few years.—Ohio Ag. Bulletin.

A BEAUTIFUL GLADIOLUS.

An example of profit and pleasure to be had from a little plot of ground was shown us recently in the garden of Mr. Ernest Braunton, landscape gardener of Los Angeles. Mr. Braunton's garden is simply his playground; it is not large, but in it he is growing hybrids of the gladiolus which he has been working with for several years, following closely the various experiments and keeping tab on the parents which impart their own characteristics to the new bulbs.

One specimen which he has very closely resembles the amaryllis belladonna in color and shape of flower, and may be named the amaryllis gladiolus. It surely is a wonder for size, texture and coloring. A noticeable feature is the number of blossoms which open at a time. A mass of them in a vase would make a boquet of surpassing beauty. Florists who have seen this gladiolus pronounce it well worthy of the work Mr. Braunton has given to its creation.

In his work in hybridizing Mr. Braunton discards many bulbs. Others, because of color or certain other characteristics, are used to pollenize desirable varieties before being themselves discarded. The work of the plant breeder is most interesting, and when conducted with the skill and patience which Mr. Braunton is showing, adds greatly to the wealth of our flora.

Farmers National Congress.

The 30th annual session of the Farmers' National Congress will be held in Lincoln, Neb., beginning Oct. 6. Geo. M. Whitaker is secretary, 1404 Harvard St., N. W., Washington, D. C.

The Congress stands for extension of the parcels post, national aid for good roads, improving inland water ways, conserving natural resources especially soil fertility and forests, federal aid to secondary agricultural schools, federal aid to agricultural college extension work.

A Roland For An Oliver

A short horse is soon curried. The late Harvey Scott's fine paper, The Portland Oregonian, already feels the need of brains and judgment at the helm, as witness the following bit of Chesterfieldian apple misinformation it printed under date of August 16:

"Did you ever hear of Watsonville? Probably not. There never has been any particular reason heretofore why anybody should hear of it. The town lies in Pajaro Valley, California. We know all about Pajaro Valley. It is one of those forsaken spots where nothing grows but sand and conceit with here and there a spindling fruit tree, which is painfully kept alive by emptying the dishwater at its roots. The Pajaro Valleyites think their poor little imitation apples are the best in the world, because they have never been blessed with a sight of the real thing. Could they once gaze on the rubicund splendor of a Hood River Spitzenberg or a Rogue River yellow Newtown or a Yamhill county Jonathan they would have nothing more to say. But alas, it is their sad misfortune to dwell all their lives in Watsonville and see nothing better than those poor little things the people down there call apples."

Now wouldn't that jar you? But what are the real facts in the case? If we are to believe the wise statistical editor of our esteemed contemporary, the big state of Oregon shipped just 1000 carloads of good apples in 1909, while Watsonville sent out only 3502 carloads in the same period, and an additional 800 carloads were canned and dried, and 300 carloads manufactured into cider and vinegar. Local consumption was something like 300 carloads, making a grand total of nearly 5000 carloads, all of which was grown in the Pajaro valley—a comparatively small section of country. Yes, neighbor, we have heard of Watsonville, and before the moon again becomes full, others even in Oregon will have heard of it also. In the meantime, what is the proverb about the beam and the mote? Would it not seem a trifle more like good fellowship for the Oregonian to exploit the Oregon apple purely on its own merits, rather than indulge in chop logic and innendo against its neighbors?

Demanding Institutes.

We note in regard to the farmers institute work of the state Prof. Warren T. Clarke says, "These meetings are held in communities demanding them and manifesting the greatest interest." We also note that the communities which start out to secure aid from the national Department of Agriculture are the ones that usually do secure it. In other words, these forces for more profitable and more enlightened work on the farm come to the aid of those who realize their value. The speakers supplied at these institutes are almost invariably men thoroughly qualified to give information, and the men sent out from the Department to investigate conditions that need correction have trained minds that can more quickly and exactly determine cause and remedy of the troubles. Any community which has need of more up-to-date methods should "demand" of our University these advantages, then supplement the demand with right down hard work in preparation for the event and in inducing all to come out and take advantage of the opportunity offered.

An Inland Empire.

The daily press has often made reference to a section but little known yet having vast possibilities for agricultural development. This section lies along or near the Colorado river in eastern Riverside county and comprises the Palo Verde and Chucawalla Valleys; all told there are over 300,000 acres of magnificent land. As to possible profitable productions, it cannot yet be definitely stated, excepting that in the Palo Verde Valley alfalfa is proving exceptionally fine, and it is thought that all fruits of the desert sections will succeed. Chucawalla is supposed to be adapted to citrus culture, but actual tests have not been made. In fact, over 100,000 acres of land lies absolutely untouched, ready for water. A company has been formed which will conduct water into the valley.

Soil Convention.

On another page will be seen notice of the coming Soil Convention to be held in the Chamber of Commerce, Los Angeles, October 3-8. There will be discussions and addresses by some of the best qualified scientists in the United States. Prof. Cyril G. Hopkins, Professor of Agronomy of the University of Illinois and Prof. F. H. King of the University of Wisconsin, author of "King On Soils" will make addresses which will follow extended investigations of soil conditions in Southern California. The facts developed in these investigations will be the basis of the addresses. This convention will doubtless be a great treat to all who can attend.

Morton Memorial.

It has been proposed, and a bill has been introduced to the senate and referred to the committee on agriculture and forestry, to establish a school to promote the science and practice of forestry, to be known as the Morton Institute of Agriculture and Forestry. This is to be a memorial to the late J. Sterling Morton, formerly Secretary of Agriculture. The prominent features will be a museum for the reception of specimens, models, and other illustrative material, in addition to the research and experimental work. The proposition that the institution shall be located at Nebraska City, the former home of Mr. Morton, has caused extensive criticism because of the fact that in such a location it would be available to but few of the people of the country.

Soil Conservation.

Soil Conservation is the title of Bulletin 406 of the Department of Agriculture and is by W. J. Spillman, agriculturist in charge of Farm Management Bureau. Mr. Spillman condemns "exploitive" farming and urges increase in the number of domestic animals and insists that where land is rented the leases must be made for longer terms, and where the renter has not capital to provide sufficient number of animals other arrangements shall be made. The ranges are decreasing and the serious shortage of live stock must be met by the small farmers. The effect of live stock on the fertility of soil is well known to every intelligent farmer.

The liberal use of legumes is also urged by the author. In proof of their value it is noted that the vast exports of cotton seed meal and other rich nitrogenous feeding stuffs calls for every possible method of retaining nitrogen in our soils. In addition the increase of live stock on our farms will keep some of these feeding stuffs at home and increase the wealth of our own country. There is no royal road to soil conservation; we must depend upon our own resources and stop the export of these great factors in our soil conservation.

As a summing up of posibilities of increase in yield, Mr. Spillman gives deep preparation of soil, planting of well selected seed, frequent cultivation of crop during growing season, judicious use of commercial fertilizers, increased use of home produced fertilizers, and the growing of leguminous crops.

National Irrigation Congress.

A letter from the Secretary of the National Irrigation Congress at Pueblo, Colorado, informs us that preparations for the great meeting are practically completed. The Congress is to open on the morning of September 26th and will continue to and including the 30th. The National Irrigation Exposition will begin the week previous to the opening of the regular session which will be held the same week as the Colorado State Fair.

Forest Service Bulletin No. 81 of the Department of Agriculture touches upon the forests of Alaska. A colored map is given showing the location of forested areas, as are many photographs of standing timber and of log rafts which show that the timber of that country has no small part to play in its financial possibilities.

Agricultural News Notes of the Pacific Coast

Northern California

The dried peach market at Yuba City hovered round the 4½ mark.

H. P. Eakle of Woodland, Yolo county, has added exceptionally fine Shropshire rams to his flock.

Sonoma county claims that it will take first place as a wine producing county of California.

Glenn county is receiving large numbers of colonists taking up lands recently brought under the ditch.

Heavy shipments of cantaloupes were made from Gridley, Butte county to Oregon.

A farmers institute will be held at Gridley, Butte county, Tuesday, September 20th.

The Contra Costa county election on good roads bonds failed to carry the measure.

Prune growers at Chico, Butte county, report outlook for a light prune crop, all other fruits good crop.

The Alameda County Poultry Association will hold its next annual at Oakland November 23-27.

A San Francisco corporation has been formed to finance a large stock farm near Stockton.

Powdered milk is being manufactured at Central Creamery, Ferndale, Humboldt county.

The Almond Growers Association of Sutter county is discussing the proposition of building a warehouse.

The Sacramento Valley Sugar Co. reports the beet crop will be materially short of earlier expectations because of water shortage.

Poultry raisers at Stockton have organized the San Joaquin Association which will hold its first annual November 8-12.

Express rates on fruit from Gridley to various Oregon points have been raised from $1.50 to $2.25 per hundred.

A visitor in the berry fields of Sonoma county, reports seeing over a thousand men, women, and children picking berries.

Woodland, Yolo county, beet fields are in better condition than a few weeks ago immediately after the hot spell.

Anderson, Shasta county, is shipping a car of Bartletts daily.

Biggs, Butte county, has exceptionally good crop of Tokay grapes.

Ukiah, Mendocino county, is beginning a four weeks' campaign in the shipping of Bartlett pears; $20 to $25 is the price usually received by the growers.

Some dairymen of Ferndale, Humboldt county, are pessimistic as to the future of the industry because of monopoly which they fear will control the market.

The poultry show connected with the state fair to be held in Sacramento next month, September 3-10, promises to be one of the best fall shows yet held.

Solano county reports nearly all of this year's apricots picked up.

Wool growers at Dixon, Solano county, have closed up their clip at twenty cents.

Central California

Turlock fruit growers are making a campaign against ground squirrels.

Some of the Tulare county Tokay shippers have netted $2000 a car.

The pure food department is one of the features of the coming county fair at San Jose.

The upper Tule river reports exceptionally low water for this season of the year.

A fruit and vegetable cannery is the hope of producers at Porterville, Tulare county.

Tulare county claims to lead in the dairy industry of the San Joaquin Valley.

The crushing of wine grapes will begin generally not far from August 20th.

Santa Clara Valley prune men have information that the eastern market is remarkably bare of holdover prunes.

One shipper sent over $6,000 worth of hogs out of Hanford last week. The price paid was nine cents.

Pear orchards in the neighborhood of Tulare have proved the section almost a typical one for pear production.

Alfalfa sections of the San Joaquin Valley report good demand for alfalfa hay, but the grain hays are all in the dumps.

Entomologist Quaintance investigating the thrips situation in Tulare county reports an improved situation with promising outlook.

County Live Stock Inspector Lang of Tulare county is making a strong fight against the spread of glanders which has appeared in one or two sections of that county.

A Fowler raisin grower is perfecting a nickel in the slot raisin machine to be located on the streets of cities for selling raisins in small cartons.

Turlock, Stanislaus county, shipped a total of 257 cars of produce during the month of July. Of these 192 were watermelons and 45 cantaloupes.

The management of the Union Pacific Railroad is securing exhibits of fruits and other products of California to exhibit at various Eastern fairs.

The watermelon campaign of Fresno is nearly over and the output has been much less than last year. The average price per ton has been not far from $8.00.

A blight or "paralysis" is reported in the vineyards of Fresno county. A pathologist from the state experiment station is making investigations. It is so serious that it will reduce the present crop materially.

The split in the Tulare County Citrus Exchange has resulted in the withdrawal of several associations and the formation of the Lindsay Exchange. This will still affiliate with the California Fruit Growers Exchange. The officers for the first year are: G. S. Berry, President; J. H. Turner, Secretary. Other directors are Dan Overall; C. B. Fair, and F. S. Hostetter.

Southern California

Highlands, San Bernardino county, expects to have an alfalfa meal mill.

The Antelope Valley is becoming enthusiastic over the production of cotton.

Dry farming operations have secured good crops near Lancaster, Antelope Valley.

Coachella Valley bean planters are irrigating land in preparation for planting Pinks.

A good roadway from Brawley to San Diego is to be the effort of a number of Imperial Valley boosters.

Almond harvesting is on in earnest at Banning, San Bernardio county.

A conference was held at Santa Ana last Thursday to discuss the matter of Orange county's good roads.

Los Angeles and Orange counties have both begun the lima bean harvest.

The first day's run at the new creamery at El Centro, Imperial county, resulted in the production of 4500 pounds choice butter.

Horticultural Commissioner Essig of Ventura county, has issued a most valuable bulletin on Russian thistle and its control.

Assistant U. S. Attorney General Lawler is investigating the condition of the Colorado river and getting legal points which may be of value.

Professor Geo. Hussman declares that Imperial Valley will produce the earliest table grapes of high quality of any place in the world.

The Mutual Orange Association of Redlands is building a new packing house west of the city on the Santa Fe line.

The San Fernando Fruit Growers Association has let contract for fumigating all orange trees owned by members of the Association.

An experimental artesian well is to be sunk near San Jacinto to secure information as to possibilities of more water at great depths. The well will be sunk 1500 feet if necessary.

The spreading of winter storm waters over the sand wastes of the upper Santa Ana river has resulted in increased midsummer flow of the waters which supply Riverside.

An effort is being made to unite lima bean growers of four counties of Southern California to work along the lines of the Ventura association which was so successful last year.

The Sweetwater Dam above San Diego will be increased about fifteen feet in height at a cost of about $200,000 which will increase the capacity of storage about 70 per cent.

Imperial Valley water users held a meeting at El Centro last week and resolved to make an effort to form an irrigation district under California laws.

In the contest between fruit growers and the cement works at Colton, San Bernardino county, the cement people are endeavoring to show that the poor condition of the trees is due to last winter's cold.

The Coast

The Pacific Northwest will produce by far the largest crop of apples ever.

Many grain farms of Eastern Washington are to give way to stock farming, at least in part.

Wallowa Valley, Oregon, is to ship 600 cars of sugar beets to the factory at La Grande.

Cattle on the ranges near Palouse, Washington, are growing poorer because of drouth.

Thirty thousand boxes of apples will be produced in the White Salmon Valley near Bristol, Washington.

The forest service of the Hawaiian Islands is maintaining an experiment garden at Makiki.

Sheep have proven effective in the control of mustard which is a great pest near Walla Walla, Washington.

Several hundred of the regular troops aided in controlling forest fires in the Yellowstone National Park, Wyoming.

Nearly a half million acres of fine land is being reclaimed near Esperanzo, State of Sonora, Mexico, by a company of American capitalists.

The legislative committee of the state good roads association of Washington is studying the needs of the state as to new roads.

The man who refused to obey orders of a forest ranger at the time of the fires near Vancouver, Washington, was arrested and fined.

Western Oregon hay producers report the 1910 crop superior in both quantity and quality to that of last year.

The record drouth of Clarke county, Washington, is fifty days without rain, a "spell" of dry weather which is just ended.

Superintendent of Entomology Ehrhorn of the Hawaiian Islands has forwarded an aphis-eating ladybird to the California state insectary.

The largest hop warehouse in the Northwest, if not in the world, will be built at Salem, Oregon. It will be 100 by 500 feet.

The Columbia Land and Orchard Company has bought a large tract at Coulee City, Douglas county, Wash., and will convey to it ample irrigating water.

The loss from the great forest fires which have swept over Eastern Washington and Oregon, and a part of Idaho, has totaled almost ten million dollars.

American methods of producing hemp, especially in the introduction of labor saving machinery, are putting the industry on a new basis in the Philippine Islands.

Peach trees near North Yakima Washington, are producing a smaller fruit, often affected with purple spots and depreciating its value. It is claimed to be caused by cold weather of last year.

An alfalfa grower at Pullman, Washington, has a variety of alfalfa which has been growing on very marshy land, producing a rank growth. He believes it a desirable variety for such conditions.

Coulson's
EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying power and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Profit in the Poultry Yard

PREPARING FOR PROFITABLE WINTER LAYERS.

By Chas. Emery, San Jose.

NOW that the troubles, trials and losses of the practical hatching season are over, there is nothing pleasanter than to watch the young pullets grow and develop into beautiful, profitable laying hens. There is something particularly attractive about a young pullet that has begun to show motherly ways, and we like to hear her talk in her odd way of laying eggs and proving to us she is useful as well as beautiful.

The amateur poultry raiser sometimes gets impatient and thinks the pullets he has raised or purchased ought to produce the much sought for eggs. They eat enough and seem large enough. They get the best of care and attention. Why don't they lay? The simple reason is they are not ready. Fowls are living, organized beings and it takes time to grow and develop the organs of egg production, so as to bring into the world beings like themselves. The pullet has no thought of just making eggs for man to gobble up.

We want the pullets to develop and grow steadily in a healthy, natural way that shall insure perfect bones, muscles, nerves, blood-vessels, lungs and reproductive organs.

Fowls of the Mediterranean breeds, such as Leghorns, Minorcas and Andalusians, should be hatched during the months of March, April and May. They often begin laying at five months old. The Asiatic breeds, such as Brahmas, Langshans and Cochins, generally take eight to ten months before they begin laying. It is well to get them hatched as early as possible. The American breeds, such as the Plymouth Rocks, Wyandottes and Rhode Island Reds, begin laying between five and six months after hatching. March, April and May are good months for hatching this breed.

Too Early Hatching.

Pullets that are hatched too early and forced to lay in early summer, stop laying in September or October and moult like old hens. They are very likely to take a long winter vacation and not lay until the spring months.

After the sexes are separated, provide the pullets with sufficient shelter. Do not confine them too closely during day or night, for overheating in the hot sunshine or crowding in small, close quarters will very likely cause a weakening of the vigor of the fowls and may lay the foundation for disease. Give them plenty of good ventilation in their houses without dangerous drafts and provide ample shade in their runs or on the free range.

Small colony houses, which are large enough to shelter fifty to seventy-five pullets, are the most desirable for healthy development of the young stock. These houses should be provided with roosts and the pullets taught to roost as soon as they are placed in the houses. It is best as the pullets grow in size to regulate the size of the flock so as to give room enough so there will be no crowding. Exercise is a much needed essential and makes strong hardy pullets.

Green Food.

Green food in abundance is much needed and aids to good digestion. Young, green, tender alfalfa, cabbage leaves, rape, Swiss chard, kale, cow beets, green grass and young green barley, oats or wheat all make excellent green food.

A mash composed of two parts bran, one part corn meal, one part wheat or oat middlings, one part alfalfa meal, one part oil cake meal, one part beef scraps, seasoned with a little salt, makes an excellent mash for growing stock. This mash should be fed dry in self feeding hoppers and kept before the young stock all the time.

Skim milk is a good food to promote growth and early maturity. If it can be fed in large quantities the beef scrap in the mash may be omitted.

Dry granulated bone may be kept before the young stock because the phosphate of lime it contains is useful in building the fowl's frame.

Fresh green cut bone as laying time approaches may be used, one-fourth ounce per day at first and gradually increasing to one ounce per day for each pullet. This is a very highly concentrated food and care must be taken in its use so as to avoid bowel trouble.

Oyster shells, broken egg shells or clam shells may be used to supply the carbonate of lime of which the egg shells are mainly composed.

No Condiments.

Such condiments as red pepper, mustard, patented or pretended forcers of egg laying qualities should not be used unless you want to cause inflammation of the digestive tract and the organs of reproduction. The reaction is so great that it weakens the tissues and disease germs are sure to attack these organs.

The drinking water should be pure and fresh and see that there is an ample supply. Water that is stagnant or impure leads to disease. Rinse the drinking vessels out every day and give them a good scalding once a week.

Grit should be supplied in the form of sharp gravel or the commercial grit. Charcoal should also be supplied.

Lice and mites must be kept in check. Dust the pullets with a good lice powder. Whitewash the houses and once a month paint the roosts with crude coal oil.

Give your pullets good, wholesome grains, grit, water, charcoal, green food and mix in a good deal of sound common sense and you no doubt will have profitable winter layers.—Mercury-Herald, San Jose.

MIDSUMMER METHODS.

Clean your coops.

Sweep your yards.

Dust the chicks.

Spray every crack and cranny of the hen-houses.

Pour distillate down every crack in the brooders.

Sun and air the brooders every day.

Provide shade and fresh water for the chicks, old and young.

Don't stint the green food.

Protect them from weasels, etc., by fine screen wire.

F. Baldwin's WHITE LEGHORNS

1st Ckl. A.Y.P. Ex.

Won 9 prizes from 9 entries at A. Y. P. Ex. and 4 1sts at San Jose, '09. Bred as layers first. Stock any age for sale. Eggs $6 per hundred. Settings $2 up. Send for free booklet and prices. ***46 Washington Ave., San Jose, Cal.***

Do You Own a Hen?

Do You Want to Build a

Fresh Air House.

Open-Front Colony House—Three Plans.

Tested Hot-Water Brooder House Designed by Leading Engineer.

Colony House for Chicks with Movable Muslin Frames in Front.

Combination Brooder and Colony House.

Special House for Extra Males or Small Matings—Two Plans.

Movable Fence for Mature Fowls or Chicks—Six Plans.

Trap Nest that Traps—Two Plans.

Special Nest for Five Setting Hens.

Safe and Convenient Brood Coop for Chicks—Seven Plans.

Special Coop for use in a Garden.

Design of Fireless Brooder—Seven Plans.

Tested Hot Air Brooder—Three Plans.

Basket for Shipping Eggs—Two Plans.

Reliable Food Hopper—Five Plans.

Good Water Fountain.

Vermin-Proof Roost Support.

All the above and many more found in the book.

Built and Used by Poultrymen—Price 50c.

No Chance for Failure

Each of the above designs, and many more, is fully explained by the builder, and illustrated with one or several clear drawings. Anyone can follow the simple instructions. No theories, no extravagant ideas to mislead you, but the money-making, completed houses and coops prove what the Builders say is true. Read their own words and learn how they do it. One plan will pay for the book.

For a Short Time Only

For new subscribers or a renewal to the Cultivator, we will give you one copy of this great book FREE with

"Built & Used by Poultrymen"	$ .50
"The Standard & Poultry World"	.50
"The Cultivator," one year	1.00
Total Value	$2.00
All Three for	**$1.50**

We most certainly recommend this book as one of the best of its kind ever published and our readers should avail themselves of this opportunity at once to get a free copy as above.

Enclosed $1.50 for club order with new book.

POULTRY QUERIES.

Raisins for Hens.

I was told that raisins are good for laying hens. If so, what portion of the ration should be raisins?—A Subscriber, Devore.

If the hens are receiving grain feed, one half of it can be replaced with raisins. More raisins than half seems to make the hens take on fat too rapidly and they do not lay as well.—M. E. S.

Moulting.

My White Leghorn pullets four months old are losing their feathers, though they are not yet laying.—T. D., Auburn, Wash.

We doubt not your pullets are entering the regular moulting and all you need to do is to feed a fairly rich ration until they take on their new feathers and begin laying.

Overfeeding?

What ails my chickens and turkeys? They seem to go to sleep and drop off the roost and sleep from 12 to 36 hours. They seem to be perfectly healthy, combs red and in good order. I have opened some of them and examined their gizzards, crops and livers and found nothing wrong. I lost 26 chickens young and old and ten half grown turkeys in three days. —Mrs. E. E. Christen, Wasco.

Your description is not sufficiently specific to enable us to give an intelligent reply. Your trouble may be due to one or several things. Limberneck furnishes some of the symptoms you describe, namely, a tendency to mope about, sit on the ground, etc. Indiscretions in feeding, impure animal foods, a one-sided ration, are some of the causes. Worm parasites also produce it. The disease may be prevented by careful feeding, and the removal of sources of infection. Good sanitation, wholesome food, and pure water are a winning triumvirate in the chicken yard.

Enlarged Crop.

We have two turkeys with very much enlarged craws. Is there any help for them or should they be killed. They are fine layers but the craw seems to get larger every day. One of them now nearly reaches to the ground. At what age do Indian Runner Ducks commence laying?—Mrs. W. L. Bailey, Tulare.

Your birds are suffering from either crop bound, or an enlarged crop. In the former, relief is obtained by giving castor oil or warm water; knead contents of crop and try to force out gradually through the mouth holding the bird's head down. If this fails, open the crop, removing a few feathers and making a short incision through the breast at the top; remove the congested contents and sew up, exercising care not to sew skins together. Enlargement of crop can be treated by cutting away a part of the skin and sewing up—not often worth the trouble, excepting in cases of valuable breeding birds.

As to laying age of Indian Runners will some duck breeder inform us?

Air Sacks.

I have a thoroughbred Minorca chicken about two months old which has a large swelling on the right side. Seems to be only air and we opened it and let the air out, but whenever the chicken peeps the whole side immediately fills with air again. Would be glad to have you answer through the Cultivator as to what is the disease and if there is a cure for it. I find so many helpful things in the Cultivator.—Subscriber, San Dimas.

This is not an uncommon complaint, the air sacks forming under the wings. As for a remedy, we know of nothing better than lancing; be sure the incision is sufficiently severe to prevent the skin again uniting shortly afterwards.

Several Difficulties.

I have some Barred Rocks that even before being fed take spells of running backward, fall, then jump up and eat well, act all right for a while, but finally die. The hens have been troubled with bowel trouble, but will they lay if not well?—W. R. P., Devore, Cal.

Birds evidently suffering from apoplexy, due to a rush of blood to the head, caused by over-eating, violent exercise, fright, extreme heat; rarely observed until victim is too far gone for treatment. Some breeders bleed from vein under side of wing; others give two drops croton oil. Severe cramp and rheumatic troubles at times give forth similar symptoms. It goes without saying that the healthy hen has the ailing one beaten in the production of hen fruit, provided always that both are from good laying strains.

ALFALFA FOR GROWING POULTRY.

The California State University gives an analysis of alfalfa which shows that alfalfa is a wonderfully nourishing food, but it also gives a very large percentage of fiber, supposed to be mostly indigestible. Now the Department at Washington gives an analysis which says that a large percentage of this fiber is also digestible, thereby giving alfalfa meal about the same nutritive value as whole wheat. This seems, at first glance, impossible, but to test the matter thoroughly, as he has a habit of doing, D. H. Hammons, of the Pacific Poultry Plant selected three chicks at three weeks old, and kept them by themselves and fed them practically nothing but alfalfa meal, to which he added a little beef scrap and green alfalfa ad libitum, but not one grain of any kind, or mash of grain. At four months old these birds are actually the pick of the flock, large and strong products, and handsome, in fact fit for the showroom, and the pullets looking as though they might soon begin to lay. He has another pen in course of experimentation, and is very enthusiastic about the saving this feed will effect. He raises his own alfalfa and contemplates putting in a mill to grind the meal.

ECONOMY IN FEED.

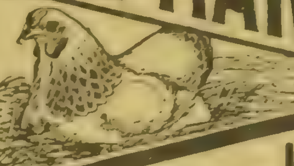
If we feed chicks, or young poultry of any variety, on an exclusive grain diet, we feed the most expensive diet so far as price is concerned, and fail to get the best growth. Give raw potatoes, onion tops, lettuce, dandelions, any form of palatable green food chopped up, with or without the mash.

If we expect to raise chicks with the hen, we know we must treat her for lice; if we fail to get lice powder or kill until the chicks are infested, we will lose some chicks.

If we are to feed farm poultry economically, we must feed what we grow on the farm. Now is the time to make out our ration for next year. There is profit in growing your own feed, and marketing the finished product.—Wallace's Farmer.

Avoid sloppy foods in hot weather.

EGG MAKER



I Have Ten Hens and Get Ten Eggs Each Day

by feeding "Lee's Egg Maker." Without waiting another day, go out and count your hens—count them carefully. For a week keep an accurate daily record of the eggs you get. The guarantee below means *you*.

WE GUARANTEE

that no matter what you are feeding, and regardless of the number of eggs you [illegible] at the present time, if **Lee's Egg Maker is added** to the daily ration [illegible] the increased egg yield [illegible] will more than pay the cost of the Egg Maker, cost of labor required, and **100 per cent profit** on said labor.

We don't care what your hens are doing *now*, we ask you to buy Lee's Egg Maker on our *guaranty* of an *increased* egg-production at a *reduced* feeding cost. Could we make you a better proposition?

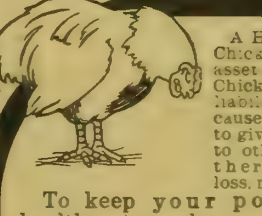
The amount of good *digestible* protein is what counts for results in poultry feeding, and America's big feeders say Lee's Egg Maker contains more *digestible* protein than any other poultry food they can buy.

Lee's Egg Maker is almost entirely a meat food and with an actual tested protein feeding value in *excess* of *80* per cent, and you'll find in it the essentials entirely lacking in other prepared poultry food. The best feeding authorities in the country endorse it—and *use it*. *You* can't afford *not* to feed it, whether you have 10 hens or 1000, the proportionate profit would be the same.

Price: 2½ lb. pkg., 25 cts., 25 lb. pail, $2.00. Ask your dealer or send direct to us. We pay freight in 100 lb. lots.

Come in and see our new 1911 line of Mandy Lee Incubators and Brooders at our newly opened Los Angeles branch, 225 West 2d St.

GEO. H. LEE CO.,
OMAHA, NEB. LOS ANGELES, CALIF.



A Healthy Chicken is an asset; a sick Chicken is a liability: because it is apt to give disease to others, it's therefore a loss, not a gain

To keep your poultry healthy—to make every hen an asset, regularly use in the feed twice a week,

Coulson's

No. 3 Condition Powders

Give it to well chickens to KEEP them well, give it to sick chickens to MAKE them well.

Helps chickens to digest and assimilate all their food, makes hens lay right up to molting and starts them laying quick after the molting season.

Irrigation and Forestry

FOREST FIRE PROBLEM.

By G. M. Homans, Sacramento.

IN one of the San Francisco dailies of August 17, an editorial appeared attacking the practice of patrolling and preventing forest fires from raging through the forested lands of the country. The article advances the theory that the debris of the forest should be burned at frequent intervals, referring to the example set by the "untutored Indians," as a measure of protection. Another writer expounds the same theory in the August number of Sunset.

It seems that these writers have become slightly tangled in the meaning of forestry, and have lost sight of what it is endeavoring to accomplish. They have evidently misconstrued its meaning and aim to be the protection of standing, full grown, saw timber alone. The term is much broader than this. Those who are practicing forestry are bending their efforts, with marked success, toward the protection of the young, growing trees which are developing into valuable saw timber, as well as the protection of the matured timber from destruction and waste by fire.

If the present stand of matured timber was the only thing to be considered and protected the problem would be an exceptionally easy one, and the theory devised by the above-mentioned writers could be used from a practical standpoint. However, the problem confronting the lumbermen and the foresters of this country is more than the protection of standing matured timber. The problem is to prevent the now standing merchantable timber from destruction until it can be converted into lumber and also to prevent the land on which these valuable forests are now standing from becoming a barren waste, a sea of brush, after the mature timber has been utilized.

When one stops to realize that a yearling pine or fir tree is no longer than a match and is so tender and sensitive to external conditions that the least heat from a fire, even though that fire is no larger than that made by a burning pine needle, will kill it, when it is considered that a three year old tree will be killed by the heat thrown out by three pine needles burning at its base, the advisability of burning over the forest floor takes on a different aspect.

How are we going to burn over the forest areas of the country at frequent intervals and at the same time provide for the development and growth of the new stand of young trees which should take the place of the saw timber which our mills are consuming, thus preventing the land from becoming absolutely worthless?

Through the methods used by the "untutored Indians," and through the carelessness and mismanagement of the old time lumbermen through the United States there are thousands of acres of land which once produced valuable forests, but are now absolutely worthless, producing nothing but brush.

There are other vast areas where only the old mature timber is standing—where successive fires have destroyed all the young growth.

The foresters of the country are now endeavoring to reclaim these barren wastes, through natural and by artificial means, to young forests and to assist the young trees to get a start on the areas where only scattered mature timber is now standing.

The only practical method of accomplishing this aim is to keep fire out until after the young forest is past the stage of extreme sensitiveness to heat, at which time the forest policy will, no doubt, be so established that sums of money can be appropriated for the purpose of going through certain sections of forest land, small areas at a time, piling the fallen logs, branches and debris, and burning these piles in a practical, systematic manner at the right season of the year, just as the U. S. Forest Service is doing today in all timber sales after the logging operation has been completed.

It is certain that from a business standpoint and from every other point of view, the forest lands should not be left a worthless, fruitless desert after they have been stripped of their present valuable product. What are our mismanaged cut-over lands of today producing? What will the lands which now bear only the mature trees produce after they have been logged over? How can we increase the value and productiveness of both these classes of lands? Simply by protecting them from fire.

In two hundred years from now lumber will be just as much in demand, if not more so, by the citizens of this country, as at the present time. There are no new forests to discover and to utilize and so why should we as the present occupants manage our lands and forests for the selfish aims of today alone, when by a little care and with a comparatively sight expense we could leave the country still producing and our forest lands in such a shape that our mills can return to these selfsame lands for a second, a third, and innumerable cuts in the future, after we have completed our span. Such a thing is possible, but not through the agency of fire, even as a servant, applied in the manner recommended by a few, because the growing stock and the nucleus of the future stand has not been considered in the protective measures.

WEALTH FROM IRRIGATION.

The uneven distribution of rainfall in the Willamette, Umpqua and Rogue River valleys, gives a typical humid climate during the months of October to May, inclusive, and during the principal growing months of June, July, August, and September, almost truly arid conditions exist. Under the agricultural practices of the past this condition was beneficial rather than otherwise. Extremely mild winters, early, moist springs, and dry summers were ideal for the production of grain and as grain was a remunerative crop, all farms were given up to its production. Fertile as these soils were at the beginning, they could not indefinitely continue to produce paying crops under the abuse they had suffered. Productiveness deteriorated, slowly at first, until lands that once produced 60 bushels of wheat per acre now produce only from 10 to 12 bushels.

As wheat at 12 bushels per acre is not a paying business, agriculture in that section is undergoing a radical change. Diversified farming is taking the place of the one time single-crop system. But although the dry season was helpful to the wheat grower, permitting the harvesting of this crop, which had grown during the moist mild winters and warm springs, in the best possible condition, it retards the growing crops which must be planted in the spring and harvested in the fall. They suffer for lack of moisture in a climate where for 90 days not enough rain falls to do more than replace that evaporated. Forage crops, root crops, vegetables, hops, and fruits must have moisture, and that is just what the climate of Oregon does not provide, during the best growing months of the year. What nature does not provide man must, or the problem confronting the farmers of western Oregon remains unsolved, or rather solves itself adversely to the welfare of that once prosperous section. Right here, the U. S. Department of Agriculture, through its Irrigation Office, undertook an investigation to determine the feasibility of irrigation as a means of furthering intensive agriculture in this region. The results have just been published by Secretary Wilson in Bulletin 226 of the Office of Experiment Stations, and the conclusions are most encouraging to the dwellers of those beautiful valleys.

With the need of irrigation during the dry summer months proven, and the great value of irrigation demonstrated, the feasibility and practicability of developing it on an extended scale was conclusively shown, as there is an abundant water supply, the general topography especially favors a cheap economical delivery of it to the land, and the soils are adapted to the growing of crops under irrigation.

Since the summer droughts and their effects are the main obstacle to normal development of the farming industry, there remains no doubt that the effect of the general adoption of irrigation will be to solve almost completely the agricultural problem that has confronted the farmers of western Oregon.

FARMERS INSTITUTES.

By Warren T. Clarke, Berkeley.

Farmer's Institute work in California was begun in the year 1892. The effort at first was financed by the University of California through appropriations from the general funds of this institution. This provision of all necessary funds by the University of California was continued for eleven years. In the year 1903 the State Legislature passed an Act entitled "An Act authorizing the Regents of State University to hold Farmers' Institutes, making an appropriation therefor, and prescribing the duties of the Controller and Treasurer in relation thereto." The sum of six thousand dollars a year for two years was appropriated for the specified purpose under the Act. The Legislatures of the years 1905 and 1907 reenacted this Act without change. The work of Farmers' Institutes and University Extension in Agriculture, owing to this generous provision of money by the state, was greatly enlarged and placed upon a more satisfactory basis than had been possible heretofore. Institutes have been held not alone in those parts of the state that were easily accessible but the work has also been done in the most remote farming sections. Distance from railroad transportation has been no bar to the effort and the work of University Extension in Agriculture was made, in some or all of its phases, to be of state-wide value and importance. The very fact that the Farmers' Institute movement was in a period of growth and expansion had the effect of creating new demands upon those engaged in the work, and, at the time of the meeting of the State Legislature in 1909, the Act previously referred to was again enacted, but with the appropriation increased to ten thousand dollars a year. This increased appropriation for the work of University Extension in Agriculture passed both the Senate and Assembly without opposition and received enthusiastic approval from the government of the state, while in the comments by the press and by those prominent in industrial and educational circles the work of Farmers' Institutes was highly praised for directness and efficiency. Regular printed reports of the work done have not been made, owing to the fact that funds for printing purposes have not been at hand. It seems appropriate, however, at this time, the end of the first year's work under the larger appropriation, to briefly point out some phases of the work and to indicate what has been done in the year just ended.

Summary of the Year.

One hundred Farmers' Institutes were held, covering 132 days, and were divided into 297 sessions. A total of 29,108 people attended these institutes and 25 state lecturers and 183 local lecturers addressed the meetings. In addition to these lecturers ten speakers from the College of Agriculture devoted a total of 134 days to the work of Farmers' Institutes.

One hundred and fifteen reading course students were registered from thirty-eight counties of the state.

The Demonstration Train was in service sixty-eight days, covering 3,436 miles of road and making 223 stops. A total of 73,663 people visited the train.

Teachers to the number of 1,200 were approached by letter on the subject of nature study. Ten thousand circulars on school gardens were sent out, while seventy-five city and county superintendents of schools were corresponded with on the above subjects. Three schools were given personal supervision in garden and agricultural work while twenty-four teachers were helped in these endeavors by letter and personal visits. In addition to all this a number of addresses were given at Teachers' Institutes and Teachers' Associations.

This bare recital of figures indicates in an imperfect way the activities of the division of University Extension in Agriculture for the past year. The great demands that the work has made upon the teaching force of the College of Agriculture should be noted, yet it has brought the University staff into very close personal relations with the people of the state in a way that has proved very acceptable to all concerned.

A suit begun by landowners at Kingsburg against the ditch company to prevent flow of water in ditches which were not lined to prevent saturation of the ground, resulted in damages being secured by property owners.

Bees and Their Care

LESSONS IN BEE-KEEPING FOR THE FARMER.

By J. G. Gilstrap, Inspector of Apiaries, Stanislaus County.

This is the third of Mr. Gilstrap's articles. The first was in issue of June 16, and the next in issue of July 7.

AT the outset let me state that after having secured a good queen for your bees, there is no other one point that is of as vital importance in the profitable management of bees as the matter of first-class worker comb. You can never hope for marked success when a large per cent of your frames is filled with drone comb. In the many hundreds of hives of bees that I am carefully inspecting I find a surprising amount of drone comb, and not infrequently is this the case in apiaries belonging to apiarists of some prominence. If you have drone comb equal to one frame in an eight-frame hive, you have thereby reduced your honey crop in that hive I think fully one-fourth. You have not only reduced your worker brood space, but these drones occupy space that is needed in the colony, and they have to be fed and cared for by the workers (the same as the aristocratic human drones in our 20th century civilization.) Remember that a worker bee hatches in 21 days from the time the egg is deposited in the cell, while the drone is thirty days in hatching.

The better plan is to put full sheets of foundation in your frames, but this is not generally available to the farmer bee-keeper, so I will speak of such methods as will give best results without foundation.

Comb Building and Comb Honey.

Always bear in mind that with a young, vigorous queen with a rather small colony of bees, you will get best results in comb building, because the queen is crowding the bees in depositing eggs as fast as comb is drawn. A heavy honey flow is not so favorable for building worker comb as is a medium or light flow. An old queen with a rather strong colony and a heavy honey flow, will often build more than one-half drone comb.

If no foundation is used or only narrow strips for starters, and your colony is medium or weak, have them build at one side of the hive in preference to building on the middle frames, every few days pressing the combs in place to make them build straight. Unless two or three frames are well filled with comb and brood, slide one over and drop an empty one between the straight combs that have the brood. Continue this method till all combs are built out. Never allow the bees to build the combs outside the brood nest as this gives you a larger per cent of drone comb.

Comb Honey.

We now come to the consideration of comb honey. The most popular plan is to use section supers holding twenty-four one-pound sections with thin division boards between the sections. These are for eight-frame hives. A narrow strip of foundation should be fastened in each section. This may be done in a number of ways. There are foundation fasteners on the market—bee supply houses—but a convenient home method is to cut your foundation in 2½ x 1½ inch strips. Prepare a polished piece of fine grained wood 1 x 2½ x 8 inches, dressing one end down for convenience in handling. The other end may be rounded slightly at both edges but left full width. This end must be carefully polished and smooth. Now to use, keep well soaked in water to prevent foundation sticking to it. Have your sections folded together, dampening at the grooves to prevent breaking. Then when perfectly dry and slightly warmed, and foundation warmed so as to be pliable. place a piece of foundation in such manner in the section, which is inverted, at bottom, that when firmly pressed with the rounded end of the wet "hand press" above described, you can press about one-fourth inch wide of the foundation firmly into the section. Then turn the remaining portion of the foundation up at right angles and invert the section, and your "starter" should be firmly fastened in its proper place.

Supers should be put on the hives before the bees get crowded below. A colony that is "honey bound" below will not work nearly so well in the sections. Bees will not so readily carry honey over sealed comb to store in sections above as if the brood is near top bar, thus placing sections near the brood.

Sometimes bees are very obstinate about going into the supers. I then open the brood chamber and select from a comb of brood a piece of brood in all stages of development, cut to closely fill one section. Put this section of brood in the center of your super. The bees come up to care for the unsealed brood, and as they cluster there, and as the young bees hatch, they put honey in the vacant cells, and not satisfied with that, they want more honey near that brood, and they commence to build comb and store honey.

Before this super is quite full place another super under it. Bees don't like an empty space in their hive; they take hold with renewed energy to fill this bottom super, at the same time finishing the top super.

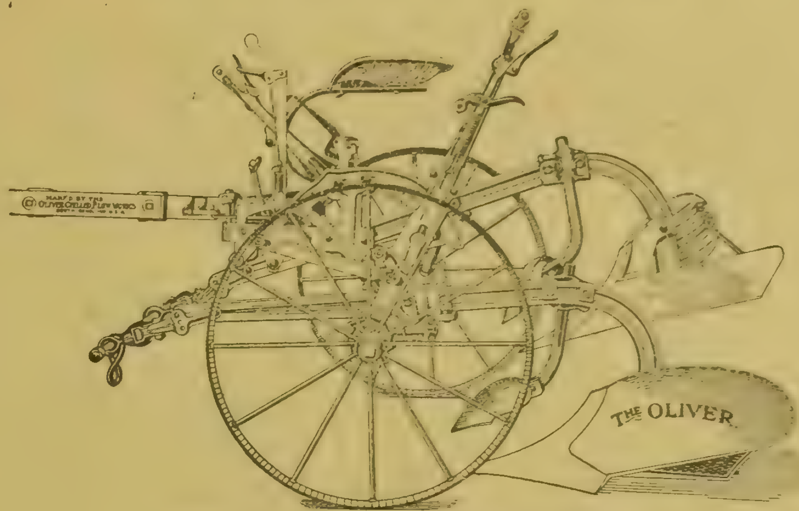
I would advise the beginner, even if he has made his own hives, to procure supers and one-pound sections from a supply dealer, for then everything fits in its proper place, and is so constructed that you will get more perfectly built comb honey. If you have any surplus honey after supplying your own table, you should have it in such shape that you can sell it to best advantage.

Mr. D. G. Shultis, Secretary of the Los Angeles County Bee-keepers Club, informs us that the next meeting of the club will be held in the committee room of the Los Angeles Chamber of Commerce in the afternoon of September 3rd. Papers will be read by Mrs. H. G. Acklin of Glendora, J. W. Ferree of Newhall, and George B. De Sellem, Los Angeles County Bee Inspector.

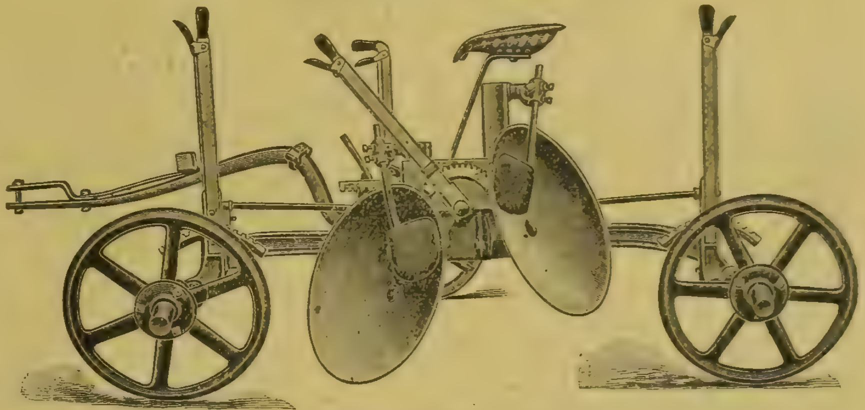
There seems to be more real enjoyment in getting rich than in being that way.

Reversible Plows
For Plowing Side Hills and Level Land

No. 508-Oliver Walking Plow



No. 23-Oliver Sulky Plow



Sunshine Disc Plow

Our Plows are guaranteed to plow perfectly and leave the land without water furrows. Send for full description and priees.

PRETTIEST NET WAIST SHOWN THIS SEASON
WITHOUT A DOUBT THE GREATEST BARGAIN EVER OFFERED BY ANY HOUSE IN THE WORLD

THIS WAIST of Brussels net is lined throughout with Japanese Silk. This material is very dainty and its beauty is increased by silk lining through the open meshes of the net.

THE FRONT of this Waist is trimmed with very heavy Val lace in a V neck yoke effect which is accentuated further by a unique arrangement of three large medallions. The back, which buttons invisibly, is delightfully trimmed with lace and pin tucks.

THE SLEEVES in the fashionable bishop style are encircled by frills of Cluny lace. The Cuffs are finished with lace edging, while the high collar of net is made with an insert of art lace and an edging of Val.

COLORS AND SIZES We can furnish this Waist in white or cream color only in the following sizes: 34, 36, 38, 40, 42, 44, bust measure.

In Ordering be sure to state Size and Color wanted.

No. 4P108 LADIES WAIST Sent to Any Address in the U. S. Prepaid **$3.00**

TO PROVE to you that our styles are the latest, prettiest and most handsome and to demonstrate that no other house can duplicate our wonderful values we will send this beautiful Waist, postage fully prepaid, to any address in the United States for the remarkably low sum of $3.00. We know you will be immensely pleased with it and we know that you will always look to us for your further needs.

Please mention the Cultivator when writing. Contains thousands of selected bargains in every day necessities. Do it to-day, now. Join our army of satisfied customers.

The Harlow-Bricca Co.
LARGEST EXCLUSIVE MAIL ORDER HOUSE ON THE PACIFIC COAST
24-30 Main Street, San Francisco, Cal.

THE new Southern Pacific Railroad main line East, which is now being built through the famous Owens River Valley, will be completed next spring, and will open up the most fertile wealth producing lands in all California. We have 4000 acres of the very choicest land in the valley, right in the pathway of the railroad, which we are preparing to put on the market.

The opening of the famous Nevada gold fields in the past two years has brought the Owens Valley farmer top-notch prices for his products and practically made him rich. And now that the connecting link between this valley and Southern California is supplied, another great market is placed at the Owens Valley farmer's door.

Big Money in Apples

Owens Valley apple orchards will make their owners rich in the next few years. When farmers get in here and settle and plant the valley, land will easily be worth $1,000.00 an acre or more. The finest big, red, waxy apples you ever saw are being grown here today with practically no care. The wealthof the land is almost unbelievable—think of 500 bushels of potatoes per acre, three tons of alfalfa per acre per cutting, timothy with 12-inch heads, and honey that won World's Fair prize. The time to get in is NOW.

The land will be subdivided into tens, twenties, and forties, and will include a complete water gravity system unexcelled in the state.

Formal opening will not be until next Spring when rail road is completed, but to buyers who will go his Summer and start their improvements we will offer very important inducements. Write now for booklet, plats, price lists, etc.

Owens Valley Improvement Co.

LOS ANGELES, CAL.

Heider Eveners A Great Invention

Made for 2, 3, 4, 5 or 6 horses. The HEIDER 4-horse Plow Evener works four horses abreast on gang, sulky or disc plow, one horse in furrow, three on land Works free, no side draft, all horses pull equal. We make clevises to attach our Eveners to all plows. HEIDER 3-horse Wagon Eveners for wagon, manure spreader, grain drill or any other implement with pole. GO TO YOUR DEALER, if he can't supply you don't accept any other. Write us for catalog and we will tell you where to get them. We also make Wagon Doubletrees, Singletrees, Neck Yokes, etc. Insist on getting HEIDER'S if you want the best in EVENERS

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Spanish Stew.

Please give recipe for Spanish stew in which tomatoes and peppers are used principally.—M. E., Riverside.

We refer inquirer to household page of this issue on which are two recipes for so-called Spanish stew. Housekeepers who have favorite recipes for this dish are asked to send them in.

Orange Vinegar.

Please give method of making orange vinegar.—N. E., Riverside.

We are unable to give such recipe and ask subscribers who have had experience to send us method of procedure. In a general way we would say: Express the juice of the oranges, add a cupful of baker's yeast to each gallon of the liquid. Allow to set for a couple of weeks, then add good quality of old vinegar or of "mother" which has acetic acid ferment. In the course of time this would probably give a good grade of vinegar.

Watermelons for Hogs.

Are watermelons a balanced ration for hogs?—I have some which have had nothing else for three weeks and do not seem to care for alfalfa or evergreen corn when they get plenty of melons. Am told that chickens do not do well when fed melons?—M. D. W., Livingston.

The experiment of our inquirer seems to be succeeding. However, we would not regard the melon as a balanced ration. We do not think the feeding of melons to hens will affect their laying.

Drying Figs.

Please inform me regarding drying figs.—A New Farmer, Auburn.

See answer to similar query in this issue.

Pruning Blackberries.

I noted in recent Cultivator suggestions regarding caring for loganberries, and wish to ask if blackberries and red raspberries are treated in the same way. Mine were planted last winter. The blackberries have made good growth and bushes lie flat on the ground. Is it better to have frame for them, and should they be cut back now or should I wait until January. The raspberries are nearly all done bearing. Should the old canes be cut off? Should they be staked?—W. E. T., King City.

Because it is stated the blackberry vines lie flat on the ground, I suppose they are dewberries, and if so should be treated same as loganberries. A couple of wires stretched along on a frame that would support the wires 12 inches above the ground would make a satisfactory trellis.

This frame is often made by driving in a stake about every 10 or 12 feet in the row and nailing a cross piece to the top of the stake—one by four, redwood, will answer for stake, and one by three pine for the cross piece. The latter should be about 18 inches long, and the stake should be 12 inches above ground. The wires are stretched along on top of the cross piece near the end and can be fastened by staple or small nail driven partly in and bent over. Cut them back any time. Cut out the old wood from the red raspberries and it will be better for the plants to fix up some kind of support to steady them from the wind. Do not train the raspberries along on a trellis as they are not a vine, but should be allowed to grow in bush form. In the late fall prune them back to about 3½ feet.—Q. A. L.

Fig Curing.

How are figs cured for packing, and are they dipped?—M. H. S., Del Rey.

Pick from tree when fully ripe. Secure all of stem so as not to break the skin. Place on trays and tu once or twice during the process drying. Do not dry too hard. When cured but still pliable put in sweat boxes for several days. They may then be dipped in boiling salt water, or some prefer a very thin syrup boiling hot. After draining fruit should be at once packed.

Blistered in the Sun.

I have cow with large udder. She was overfed on green fodder and was affected with colic, and lay down in the sun until I made her get up and go into the shade, but not until the sun had burned the udder terribly. It seemed to make her sick so that she would eat but little; her udder was caked and feverish. She is now somewhat better and I am permitting the calf to take care of the quarter stil affected. Am bathing the udder hot water three times daily, following with soft salve. There is stil a blister as large as the palm of one's hand. Am I following the right course?—Subscriber, Sultana.

I see nothing more to recommend and think your treatment good. trust by this time the patient is well When she freshens next time watc her carefully and see that she milked clean and not allowed to li down in a damp place to sleep. is well if the cow is at all fat give her a dose of Epsom salts, on pound with a tablespoonful of groun ginger before she calves to lesse the danger of inflammation.—M. E.

Fly Repellants.

Please recommend mixture for pu pose of spraying horses and cows repellant of flies, or can you give mula for making same?—Subscribe Lancaster.

Stock food dealers who have adve tised in the Cultivator have called a tention to repellants which have gi en excellent satisfaction. That probably the simpler way of securi results, but if the inquirer wishes mix his own repellant, he can do by taking one pound of tobacco stem which steep for sometime so as make a strong "tea," say about thr gallons, and a little turpentine, or there are no sores on the animals little coal oil may be added, say ounce to a gallon. Wash stock wi this and lice and flies will have use for them for a short time. O writer in former Cultivator reco mended use of ordinary kerosene a spray. Use lightly so as not take the hair off. Another is: four quarts of coal oil add one qua of fish oil and a pint of good sto dip, shake well, then spray or wi on the hair of the cows.

Value of Manure from Cow.

We have in operation a fruit and dairy ranch. We have manure from 40 head of horses and cows to be distributed over the place. We wish to give the dairy proper credit for its manure and would like to ask what is a fair price for manure of a cow for one year; also for that of a horse.—H. A. S., Kerman.

The value of manure from any animal depends upon the feed, litter used for bedding, and care with which the liquid portion is saved. Estimates of the daily production of a dairy cow range from 70 to 108 pounds of the fresh fertilizer. Taking 75 pounds as a fair average, one may multiply by the 365 days in a year and then secure the worth of the annual output according to price in each section. For instance near any large city stable men hire the manure hauled away. In a rural section it has greater value, and usually in proportion to its distance from large producing sections. Probably the fruit grower in Fresno county can determine approximately the value of his cow manure and thus determine proper credit to give to his stock. The amounts produced by different live stock taken from Bailey's Cyclopedia of Agriculture are as follows: Excrement produced daily per thousand pounds live weight; sheep 34.1 pounds, calves 67.8 pounds, pigs 83.6 pounds, cows 74.1 pounds, horses 48.8 pounds, fowls 39.8 pounds. The above figures do not include bedding or absorbents and these may add almost as much of manurial value.

Mottle Leaf.

What is the cause of mottle leaf in oranges? My navels and Valencias seven years old have good care as to culture, water and fertilizer, have made strong growth this season and have fairly good crop. Trees which were not fertilized do not show mottle leaf.—Reader, Bloomington.

The question of mottle leaf is one of the most perplexing that has been discussed for years. We would call our subscriber's attention to articles which have appeared in recent Cultivators, written by Mr. Snowden. If he has used commercial fertilizers they may have affected the chemical composition of the soil to the extent that the condition of which Mr. Snowden writes may have been brought about. Again, the possibility of hardpan or a physical condition about the roots which is not healthful should be investigated.

Sweet Wine.

Please give formula for making sweet wine. What grapes are most suitable?—O. E., Ontario.

To answer such a question would be entirely beyond the limits of these columns for the manufacture of wine is a trade in itself. There are books published on the subject which would no doubt be helpful.

BEE-KEEPER'S GUIDE.

Prof. A. J. Cook's Manual of the Apiary which has long been considered a standard by every up-to-date bee man is still in print and meets with ready sale. California beemen should have a particular interest in it because of Prof. Cook's residence in this state and because of his interest in California honey production.

Regarding this book we note in a recent review by the American Bee Journal: "It is instructive, interesting, and both practical and scientific. On the anatomy and physiology of the bee it is more complete than any other standard American beebook. Also the part on honey-producing plants is exceptionally fine. Every bee-keeper should have it in his library."

It is a book of 544 pages, has 295 illustrations, is bound in cloth, and will be mailed by the Cultivator at the price of $1.20.

Money Making Little Liners

In this department we will insert your advertisement under a classified head for 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for our many thousand readers.

MACHINERY.

For Sale—Second-hand windmills, tanks, engines and farm machinery that will do the same work as new at half price. Domestic and irrigating windmills and tanks. Twenty 2000-gal. tanks at $18.50 or $20, f. o. b., 2 H. P. Fairbanks, 3 H. P. Dempster, 4 H. P., 6 H. P. Fairbanks, 6 H. P. White & Middleton, 9 H. P. Moore, 10 H. P. Lambert, 20 H. P. Fairbanks, like new; 25 H. P. engine and mining hoist, 2 H. P. steam boiler and engine. Farm and light express wagons, surrey $35, baler, header; gang, disc, road, riding, and walking plows, weeder, cultivator, feed rack, wagons, tanks, mounted sawing outfit, fruit crusher, bone grinder, wheelbarrows, pipe, Fresno and Slip scrapers. Most anything a rancher wants second hand. Demmitt Co., upstairs, 120 N. Main St., Los Angeles, Cal.

ENGINES.

For Sale—11-H.P. Distillate Engine. Used a short time; priced accordingly. In perfect condition. Our guarantee goes with it. Machinery Exchange, Main and Bruno Sts., Los Angeles, Cal.

For Sale—Gasoline Engines of all sizes. New Alamo's, none better on the market. We also have a good stock of second-hand engines taken in exchange and we guarantee these like new and still save you money. An investigation will pay and convince you. Bailie & Brandt Company, 943 and 945 N. Main St., Los Angeles, Cal.

HORTICULTURAL PRINTING.

The Kruckeberg Press, 123 South Los Angeles St., Los Angeles, Cal., makes a specialty of Horticultural Printing and Engraving. Cuts and illustrations of all standard, economic and ornamental plants on hand and subject to the use of patrons without cost. Samples and estimates cheerfully furnished. Remember, we design, write, engrave, bind and print; in brief, do the "whole thing," at no additional expense to the customer. Correspondence a pleasure.

LAND FOR RENT.

For Lease—33 acres, all in bearing fruits. fully equipped. Two hours' ride from San Francisco. In Sonoma county. Address Mrs. M. H. Jenkins, Route 1, Box 40, Sonoma, Sonoma Co., Cal.

Poultry Show Dates

Sacramento, September 3-10, 1910. Annual Poultry Show held in connection with the State Fair. E. F. Mitchell, Director, Sacramento.

North Yakima, Washington, Sept. 26-Oct. 1, 1910. Washington State Fair. John W. Pace, Secretary, Harry H. Collier, Superintendent.

Stockton, Cal., Nov. 8-12, 1910. First Annual Exhibition of the San Joaquin County Poultry Association. Eugene P. Sabin, Secretary, Stockton.

Aakland, California, Nov. 22-27, 1910. Annual Exhibition of the Alameda County Poultry Association. E. K. Healey, Secretary, Alameda, Cal. tary.

Seattle, Wash., Dec. 5-10, 1910. F. E. Barth, Secretary.

SEED.

California Black Walnut Seed from finest, thriftiest trees in the state. Write for prices on any quantity from 5 lbs. to a ton. M. J. Crow, Gilroy, Cal.

POULTRY.

White Orpingtons—Cook Strain. We offer for sale a limited number of trios and pens of utility and exhibition stock at bargain prices for the summer season. Our breeding pens are imported direct from Wm. Cook & Sons, Scotch Plains, N. J., and are sons and daughters of first and second prize winners, Madison Square Garden. Messrs. Cook & Sons say of them: "They are all from some of the finest birds in this country." Book orders now for next season's hatching. Eggs $5.00 per 15. $25.00 per 100. Day-old chicks 50c each. October delivery. Rancho La Solana, Box 143, Chula Vista, Cal.

How to Make Money—Mrs. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1.00. Address Mrs. A. Basley, Box 77, Venice, Cal.

DAILY GREETING.

Pace through thy cell, old Socrates,
  Cheerily to and fro;
Trust to the impulse of thy soul,
  And let the poison flow.
They may shatter to earth the lamp of clay
  That holds a light divine,
But they cannot quench the fire of thought
  By any such deadly wine.
They cannot blot thy spoken words
  From the memory of man
By all the poison ever was brew'd
  Since time its course began.
Today abhorred, tomorrow adored,
  So round and round we run;
And ever the truth comes uppermost,
  And ever is justice done.—Selected.

AN INDIGNANT DEPOSITOR.

A LEAN, grizzled man shouldered his way through the anxious crowd gathered in knots in the Madison bank, and without knocking strode into the president's private office.

"Are you the president of the bank?" he asked a dapper little man seated before a large roller-top desk.

Mr. Amherst stared superciliously over the rim of his glasses. "I am," he said with icy deliberation.

The lean man picked up a chair and set it down with a thump at the side of the desk. "Well, I want 'er talk to you."

"I'm sorry, but I'm too busy"—began Mr. Amherst.

The lean man hit the desk a blow that jarred several pens from a holder. "Your business will have to wait," he said. "You're goin' to listen."

Mr. Amherst glanced nervously toward the door, but the stranger cut off that means of escape. "Well, of course, sir, if—"

"Just listen; I'll do the talkin,," said the lean man. "I lived on a farm, Mr. Amherst, until I was 20 years old. During them years I did more work than you and your ancestors have done in a century, but I determined I'd get away from the farm, and I saved every cent I could get with that idea in view.

"One day, after ten years' savin', I found I had $100. Think of it, ten years to save $100. Well, I came here and got a job in a small grocery store, I knew how to work and save, and in five years I bought that store. When it was mine I worked harder than ever; I wanted to buy a bigger store in town.

"In another five years I had $3,000, just the amount I had set my heart on. Then the bank I had my money in broke. I didn't get a cent.

"That hit mighty hard, but I kept my spunk up and started all over again. I was 30 years old then; I'm 40 now, and I've saved $3,000 again during the last ten years.

"That $3,000 is in this bank, Mr. Amherst, and I've come for it. I want my money."

Mr. Amherst took off his glasses with trembling fingers, and wiped them on a fine cambric handkerchief. "I assure you, my dear sir, that you will get every cent of your money. Just now, owing to some complications, we are not honoring checks, but the bank is as solid as Gibraltar."

"That's what they told me before," the lean man said slowly. "But I don't want promises. What I want is my money."

Mr. Amherst looked longingly toward the door. "But, of course, my dear sir, you can't be preferred to the other depositors," he faltered.

The lean man rose abruptly to his feet and kicked back his chair. "I've said all I've got to say; now I want my money. Now, do you understand —now!"

The lean man was glaring down fiercely. One of his hands rested on the desk, and opened and closed convulsively. Mr. Amherst noticed that it was brown and knotty, and seemed to have a powerful grip.

"I'll—I'll call the cashier and you can talk it over with him," Mr. Amherst stammered.

"You'll do nothing of the kind. You'll get me that money yourself—three thousand dollars—or there'll be one less grafter in this world in a few minutes."

Mr. Amherst's cheeks blanched and he ran his fingers trembling along the corners of his mouth. The lean man suddenly took a step backward and thrust his right hand into a hip pocket.

"I'll get the money," Mr. Amherst exclaimed.

Through a passageway reached by an inner door of the office Mr. Amherst made his way to the vault, the lean man at his elbow. A few minutes later they were back in the office, and one of the lean man's pockets were bulging. Picking up a piece of paper, he scribbled a few words on it and handed it to Mr. Amherst. "My receipt."

It read: "Received from John Amherst $3,000, sum of my deposits.—John Wilson."

At the door, he paused and looked back with a smile. "Take my advice and be honest hereafter in your banking business," he said.

A moment later the door swung open again and Mr. Amherst, pale and nervous, came out and threaded his way to the receiving teller's cage.

"How much has John Wilson got deposited here?" he asked.

"John Wilson?" the teller's expression became vacant. "I never heard of him."—Universal Magazine.

ABOUT CALLS.

There are many women who are puzzled as to the length of time that should elapse between calls. A first call should be returned within two weeks, but after that formality there is no specified time. Within two or three months, at one's convenience, is correct, but if calls are not exchanged at least once a year, the acquaintance is said to be dropped. The older residents of a neighborhood are expected to call on those lately moved into it, as the newcomer can not and does not know even the names of her new neighbors. She should return such calls within two weeks, leaving a card of hers and her husband's for each woman in the family and one of her husband's for each of the men of the family. Then, if the acquaintance is not found agreeable, neither side calls again.—Portland Oregonian.

AND SO THEY WERE MARRIED

A-spinning sat Priscilla fair;
John Alden came to woo her there.
So she put down the spinning wheel
While he put up a winning spiel.
—Kansas City Times

SPANISH DISHES.

An inquirer wishes recipes for a Spanish stew also other Spanish dishes. We start with four this week from the Times Cook Book. Have any subscribers favorite dishes which they will send in?

Beefsteak Spanish.

Lay a slice of upper round steak, about two pounds, rather more than two inches thick, on a pie plate, leaving on the rim of suet. Add a small teacup of water and baste every ten minutes for thirty minutes, baking in a moderate oven; remove from oven, sprinkle with a saltspoon of salt and half a saltspoon of pepper, and cover with a layer of sliced onions: bake fifteen minutes longer; sprinkle with a saltspoon of salt, then cover with a layer of chopped tomatoes (the solid meats of a can of tomatoes will answer). Bake again fifteen minutes, sprinkle over it two tablespoons of grated cheese and place in oven long enough for cheese to melt nicely. There will be a thick rich gravy on it, deliciously flavored with the onions and tomatoes. The steak will be very tender.

Spanish Stew.

Melt two tablespoons butter, slice two small onions and mix with a bowl of meat cut into pieces, brown all together. Then add one teaspoon flour, four or five tomatoes, two carrots cut lengthwise, two tablespoons of Worcestershire, one tablespoon of chili sauce, one seeded red pepper cut fine, one tablespoon salt and two or three cups of stock, and let simmer slowly until thick and done. Serve on platter and garnish with twelve large red peppers which are stuffed with the following: one cup tomatoes, two crumbled crackers, one level teaspoonful of salt and sugar, one lump of butter mixed. Fill peppers and bake slowly for twenty minutes.

Spanish Stew.

Take two pounds of round steak or lean stew meat cut in inch pieces and stew until very tender in small amount of water. While the meat is cooking, clean a dozen large ripe chili peppers by removing seeds and all the veins, excepting about seven or eight veins in all, (the veins are the hot part), then cover and let come to a boil; remove from the fire and when cool enough to handle, scrape with a knife the soft red chili, leaving this skin to throw away. Then fry 3 medium sized onions in suet; add two small tomatoes and the chili you have just removed from the skins; add a little water, half a teaspoon of sugar, and salt to taste; let cook until very soft, then rub through a strainer; add to the cooked meat and let all come to a boil; thicken with a very little flour rubbed smooth with milk. If the tomatoes are not tart, add a teaspoon of vinegar.

Beef Tamales.

Boil one pound of beef and pour over it some hot beef fat. Scald thoroughly one quart of meal, adding one teaspoon of salt and a tablespoon of lard. Cut off the upper end of corn shucks and put to boil in cold water; let scalded meal and shucks cool off; chop the beef fine and season to taste with the salt and chili powder. Put a thin layer of meal on shucks (leaving shucks enough to turn ends and sides under); then put a small quantity of meat in center. Put a few shucks in bottom of a pot to prevent scorching and pack in the tamales, placing a weight on top. Cover with boiling water, adding one tablespoon each of lard and chili powder.

VARIOUS USES OF BORAX.

No one known article within our reach possesses the virtues of borax for general use in the household. As an antiseptic and disinfectant it stands preeminent.

As a washing powder it is excellent. For the dining room and kitchen it is equally effective.

Added to dishwater it brightens the china and glassware and cleans the silver.

Coffee pots and tea pots in which borax water is boiled two or three times a week are purified and entirely freed from musty taste or odor.

As a simple household remedy for the many ailments of the family borax is unrivaled.

If the eyes are weak or inflamed a daily washing with a solution of borax will strengthen and cure them.

For sore throats a small quantity of powdered borax dissolved in the mouth and swallowed is very effective.

A cold in the head may be relieved by snuffing powdered borax.

The bites of insects, as well as summer rashes, will cease to give pain if bathed in borax water.

A TWENTY CENTURY OLD EXAMPLE.

"We will never bring disgrace to this our city by any act of dishonesty or cowardice, nor ever desert our suffering comrades in the ranks; we will fight for the ideals and sacred things of the city, both alone and with many; we will revere and obey the city's laws, and do our best to incite a like respect and reverence in those above us who are prone to annul and set them at naught; we will strive unceasingly to quicken the public's sense of civic duty; that thus, in all these ways, we will transmit this city not only not less, but greater, better, and more beautiful than it was transmitted to us."

This is the oath which the young men of Athens took upon assuming the duties of citizenship. As the editor of The World's Work says in the August number: "Certainly it is as pertinent on the lips of a young American today as on those of a young man in the city by the Acropolis twenty centuries ago. Only it must be remembered that to the ancient Greek the 'city' meant also the nation."

PROOF.

"Do you believe, Doctor, that man is made of dust?" asked the student.

"I don't know about man," returned the professor, "but I am sure girls are—they make such a dickens of a lot of trouble when they get in a fellow's eye."—Harper's Weekly.

The everyday cares and duties, which men call drudgery, are the weights and counterpoises of the clock of time, giving its pendulum a true vibration, and its hands a regular motion.—Henry W. Longfellow.

You've got to put your see'ers on,
An' go an' hunt it up."

San Francisco and Los Angeles Produce Markets

Los Angeles Markets

LOS ANGELES, Aug. 24, 1910.

Butter.

Large receipts for past four days has caused a weakness in the butter market and on Tuesday a decline of one cent from last week's quotations was made. Receipts on that day aggregated 39,256 pounds.

Price to trade 2½c in advance of the following Produce Exchange quotations:

Extras	33½
Firsts	31
Cooking	23½

Cheese.

Northern fresh	17@17½
Anchor, large	18
Oregon Daisy	18½
Imported Swiss	28@30
Domestic Swiss	22@24

Eggs and Poultry.

Eggs stand at same quotations as last week. The prime factor in the market remaining stationary is the large receipts of Easterns.

Paying price f. o. b. L. A. is:

Local ranch candled	37
Case count buying price	33
Eastern fresh	30
Eastern storage	27

Dealers pay for live poultry f. o. b. L. A.:

Hens, per lb	15@17
Roosters	9
Broilers	16@17

Hay.

Arrivals of hay for the week have totaled the immense amount of 7200 tons, which is about 2000 tons more than we received the previous week.

An occasional offering of fancy hay readily commands our topmost quotation, but there is so little of such quality available that it cuts only a trifling figure in the market. The bulk of hay that is arriving is selling here at from $8.00 to $10.00 per ton, and the quantity arriving is so great that it is under the utmost difficulties that same has been placed.

There has been some hay shipped along the Coast right along, but not in large quantities, and foreign shipments have been very moderate.

Alfalfa hay continues decidedly firm at the advanced figures and quantities of this article have bten bought and a number of shipments this week directed toward the North. Alfalfa hay, at this time, is located on an entirely dieffrent basis from hay of any other variety, on account of the extraordinary demand in the North, which developed suddenly, and the fact that the large dairying interests had not prepared for their winter stocks.

Fancy wheat	12.50@13.00

Deciduous Market

SACRAMENTO, Cal., Aug. 20, 1910.

The following circular of the California Fruit Distributors gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, August 19, 1910:

Peaches.

Two hundred and one cars: Salways have made their appearance and a few cars have gone forward. There will not be a great many to offer this coming week, but after that the supply will be ample.

Plums.

Fifty-seven and one-half cars. There has been no particular change in the plum situation since our last report. Shipments will continue to decline.

Pears.

One hundred and eighty-two and one-fourth cars. As predicted one week ago, the pear shipment is considerably smaller than for some time past. There will be a further decline during the coming week. Some winter pears are moving out, but the crop is very light and shipments will be limited.

Grapes.

Two hundred and sixty-four and three-fourths cars. There is no particular change in the situation on grapes since last week. It is expected, however, from this time on, that shipments of Malagas will decline and shipment of Tokays increase. There are but few Thompson Seedless moving forward now. Black Prince are going forward from the Lodi section and are reported to be of good color and proper ripeness.

Weather conditions continue very favorable and all crops are maturing nicely.

ALMOND SALES.

As soon as we quoted out prices one week ago our "friends, the enemy," began at once to underbid us, but some of the "trade" recognize that we are here to stay and have begun to make friends by buying from us. The first week we have booked orders for forty tons and have negotiations about ready to close for 60 tons additional. You may look for orders right along now and we expect to begin shipping just as soon as we can sort out cars.—California Almond Growers' Exchange, J. P. Dargitz, Secretary and Manager. Sacramento, Cal., Aug. 20, 1910.

Citrus Market

LOS ANGELES, Aug. 24, 1910.

With large receipts of all kinds of fruits the general Eastern market is showing a light demand for Valencias. Regular sizes that are well colored, however, are commanding $4.00 to $4.75 f. o. b. Eastern points. These prices are somewhat under those of a few weeks ago, but probably still a dollar in excess of last year this date. This, considered with the lower grade fruit which is going out this year, makes a condition which is almost phenomenal. Unfortunately much fruit is going out small in size and green in color. These shade the prices given above, often by $2.00 or more.

Lemons are practically cleaned up. This, with the light receipts of foreigns, insures the few which will yet be cut good if not exceptional prices. Everything which can be cut now is going forward almost direct from tree.

Shipments.

Shipments of citrus fruits to date since November 1, 1909, 38,563 cars, of which 24,279 were oranges and 4,284 lemons. To same date last year, 35,553 cars, of which 29,863 were oranges and 5,690 lemons.

NEW YORK, Monday, Aug. 22.—Twelve cars oranges and one car grapefruit sold. Market weak.

POULTRY AT THE STATE FAIR.

Considerable interest is being manifested among the poultry breeders of the state in the forthcoming exhibition to be held in conjunction with the State Fair at Sacramenta, September 3 to 10, 1910. Entries will be received as late as 6 o'clock p.m. Friday, August 26. Judging will be done September 3. In the selection of judges the management is to be commended, first for the high character of the men selected, and second, for the fact that they represent the state as a whole. Northern California finds its representative judge, Henry Berrar, in the saddle; Robert J. Venn of Fresno, has probably done more than any other one man to sustain a healthy interest in Standard-bred birds in the great San Joaquin Valley, and he will call out strong exhibits from Central California; while S. Tyler, the veteran of 50 years in the show room will sustain Southern California's reputation at the Fair for progress and thoroughbred birds. Breeders contemplating exhibiting can secure premium lists by either sending to J. A. Filcher, Secretary, Sacramento, or to the Chamber of Commerce, Los Angeles.

Business Notes

WILL SAVE DOLLARS FOR YOU.

The new catalogue of Draper's Cut-Rate Mail Order House just off the press is ready for free distribution. Every reader of the Cultivator should send his name in for a copy. Draper's combination offer as advertised in this issue of the Cultivator is a money saver for everyone. Write for particulars to Draper's, 514 South Main St., Los Angeles, Cal.

A HUGE WORKSHOP

Nature is a wonderful chemist. Constantly at work down in the bowels of the earth, her seething cauldrons are going day and night.

Gold, diamonds, and other beautiful stones and precious metals are all from Nature's laboratory and attest to her artistic skill. Iron, copper, coal, salt and asphalt are among the innumerable products which show the endless variety and practical forethought for man's needs. Nature works her wonders carefully and well.

For centuries nature's wonderful alchemy has been forming this natural asphalt and mutely waiting for the time when man should have need for it and recognize its value.

The Barber Asphalt Paving Co., Philadelphia, were the first among the people of modern times to recognize the immense value of Trinidad Lake asphalt and adapt it to commercial uses.

Genasco Ready Roofing is the product of their experience and skillful use of this natural asphalt and is the best possible roofing for all purposes. It defies storms, heat, cold, and every other weather condition.

Genasco is adapted to every building on the farm, from your residence to the chicken house.

It is easy to apply and saves the expense of experienced roofers, and can be laid by any handy man about the farm.

Valuable information on the subject of roofs is incorporated in The Good Roof Guide Book issued by the Barber Asphalt Paving Co., Philadelphia. They will send a copy to anyone for the mere asking.

A thirty-two page nursery catalogue filled with meat from start to finish has been issued by the Leonard Coates Nursery Company, Inc., Morganhill. The catalogue begins with a bit of the history of the company from its beginnings in 1878 in the Napa Valley to its securing of its present location in Santa Clara county. Mr. Coates, the manager, makes a particular feature of pedigreed stock, also of growing most of his stock without irrigation.

NO HOOF, NO HORSE.

Statistics show that 80 per cent of all horses are lame, and that 80 per cent of the lameness is caused by hard and contracted hoofs. Especially are the long, dry spells of this section productive of these troubles. Owners of horses should realize this, and give proper attention. They should be kept soft, and at the same time toughened and nourished. In selecting an application for this purpose, it should be remembered that a horse's foot is from 60 to 70 per cent water, and that grease and water will not mix. This is the reason why it is really worse than useless to apply ordinary ointments. They not only will not penetrate themselves, but they keep other moisture from penetrating, and any horseman knows what this means. For some time there has been on the market, in the East, a wool fat preparation for this purpose that has given great satisfaction. Wool fat is not a grease, but readily mixes with water and is penetrating. It is not only a medicine of itself, but it acts as a vehicle to carry to the afflicted parts other medicinal properties that may be contained in an ointment. There has recently been organiezd a company in Los Angeles for the manufacture of preparations with refined wool fat as a basis, and for several months past they have been introduced to horsemen in this part of the country. As the sale for them is growing very fast, it would indicate that they are meeting a long felt want. They seem to have the utmost confidence in their remedy, as they offer to send a package without any money, to be paid for only if satisfactory. Read the advertisement of the West Coast Manufacturing Company on another page of this paper, and send for a trial package, or send for one of their folders with some good testimonials.

WESTERN DEEP TILLAGE
Disc Plows
The Pluto, Jr.
The Plow that Does the Business When All Others Fail
Specially renowned for their great strength, durability and the simplicity of their various adjustments. Constructed on correct mechanical principles.
You don't have to send a master mechanic to the field with 'em. Specially constructed discs that will not break.
High Grade Implements and Farm Machinery
Look at the Construction
Why should the frame of a disc plow drag on the ground when you want to plow ten inches deep any more than that of a mouldboard plow? Who would buy a mouldboard plow if the frame dragged on the ground?
Then why buy a disc plow that does this when you can get the PLUTO JR., which has more clearance under the beams when the discs are in the ground, even deeper than it is possible to put them on the other type of plows before their discs have even entered the ground.

LOUISVILLE KY.

RELIABILITY.

Has passed through another most successful season's run, this being the fifth since starting.

There is no experiment in buying a POMONA PUMP. All the parts have been tried out and fully perfected. They will do the work, we know, and do it well.

We have records of plants that have made three seasons' run without one cent for repairs of any kind.

ECONOMY.

May be driven by a steam engine, gas engine or electric motor and in any case will give you the cheapest water and pay dividends on your stock.

Any Water Company going into the Irrigation business will run no chances in buying the POMONA PUMP. They are built heavy and strong. All the wearing parts are Bronze Bushed or Babbited and will last a life-time with the smallest outlay for repairs.

We can refer you to customers who are operating their POMONA PUMPS for less than one-half cent per inch per hour on 200 feet lift. This is less than half what their water costs with other pumps. The same make of engine being used in both cases.

Send for illustrated catalogue to—

The Passing of the Man With the Hoe

Taken from an Article by EDWARD A. RUMELEY in August World's Work.

Great Advances in Agriculture Made Possible by Use of Power on the Farm.

IF George Washington should come to life in Pittsburg now, should visit the steel mills, the Westinghouse plant, or a hundred others, he would be hopelessly bewildered. It is all beyond the philosophy of a man who lived a hundred years ago. There is hardly a process which he would understand.

If a contemporary of Moses, who was a good farmer, should come to life and visit the ordinary American farm, he would recognize practically every process.

The industrial revolution, the steam engine, electricity, everything that goes to make up the "steel age," have in fifty years created a greater difference in the production of the world—except in agriculture—than had been made since the days of the Pharaohs. The corresponding revolution in agriculture has unobtrusively begun.

Ten years ago, at the University of Oxford, our lecturer on political economy laid it down as axiomatic that science and invention, the division of labor, the law of diminishing returns, could do little to save human labor on the farm; that the conditions of its toil were nearly unalterable, its processes predestined to be slow. Yet these few years have seen immense advance, and today no forecast can predict the progress of the future, for man is clearly shaking off the heavier shackles of manual toil. Pipe and tabor no longer lead the procession of harvest home, but drudgery goes as well as romance, and a business air sets the thresher to factory pace.

American agriculture must develop enormously along new lines if it is to save the nation from hunger. Within ten years a million new farms have been created, and our farm products have more than doubled. But consumption is still so rapidly overtaking production that our exports of agricultural products last year fell fifty-six million dollars below those of 1899.

Better methods will do much to save us. Science is making the land more productive. It is molding plant life to serve better and more profitably our daily needs—trebling the amount of sugar in the beet, quadrupling the possible corn-yield of an acre. But machinery will do more. By its quick, reliable work it has already vastly improved the quality and quantity of the harvest by confining crop operations within the period when the most favorable conditions prevail.

There are today more gas-engines at work on our farms than in our shops and factories—at least 600,000 of them. And it is estimated that one-eighth of all the power used on our farms s now mechanical. The eighth will soon become a quarter. Light motors are speedily growing heavier, showing that heavier and more general work is now being done by machinery. Plainly, we are seeing the beginning of the era of mechanical power on the farm.

Swift-coming changes make prophecy sure. The old-style farm-wagon is being rapidly replaced by eight or ten different machines, and ts one surviving use—that of carrying the farmer and his family—is now being widely usurped by the automobile, of which several special ypes for the farmer have just been designed. One, half-buggy, half-truck, can be harnessed to a wagon or to light machinery. A single manufacturer is now selling a thousand farmers' automobiles a week, 650 of these going west of the Mississippi.

In the near future, to escape ruin, every farm must have its own power-plant in an efficient motor. Even now, motors of myriad kinds are performing nearly every sort of farm labor—plowing, seeding, harrowing, rolling, reaping, binding, threshing grain, grinding corn. They are shredding fodder, loading hay, milking cows, shearing sheep, drilling wells, running spray-pumps to protect the fruit-trees—even doing chores by carrying water and sawing wood. This ready power on the farm will give country life many of the conveniences of the city. Nearly everywhere the farmer now has the telephone and daily mail delivery. The motor will add electric light and heat and an automatic water-system giving a pressure equal to that of the city main.

Until now, mechanical progress has seemed haphazard. Farmers have studied their own needs. Some of them have been able inventors, and the chance of a market has sharpened the wits of manufacturers. But there has been no competent direction—no one to whom either farmer or manufacturer could look for advice or help in mechanical improvements or the better planning and organization of farm work. Significant of the coming age, a new profession has suddenly been created by this necessity. Eight state colleges are now offering full courses in agricultural engineering.

As machinery multiplies rapidly for every conceivable farm need, as it cheapens in cost and grows in efficiency, we begin to understand the astonishing gist of the thing. See how enormously it increases the acre-efficiency of man, saving human labor in a day when labor is scarce. From plowing to shelling, it takes four and a half hours of work to produce a bushel of corn by hand. By the latest mechanical methods, the whole process can now be accomplished in forty-one minutes. A bushel of corn can be shelled in one minute where it formerly took a hundred. In planting corn, one man in a single day "puts in" twelve to fifteen acres better than the "man with the hoe" can plant one.

The latest harvester equals the work of forty men with sickles. Instead of eleven hours to cut and cure a ton of hay, today it takes one hour and thirty-nine minutes. And so the round of the whole farm. The saving of labor is so vital a thing to the farmer that it often pays to use a machine like the new corn-picker that saves men but not money.

The machine enormously saves animal labor, and a new question is being asked. It was only the other day that the Department of Agriculture told us:

"The comparative merits of animal and mechanical power will in the end probably be resolved into a question as to which source of power will require the least acreage for the production of fuel, owing to the rapidly growing area required to supply food for the human race."

In farm labor we are seeing the passing of the horse and mule. The new internal-combustion engine costs about $90 for each horsepower, while a horse equally efficient costs from $175 to $200. Among many other economies there is the matter of food. The latest engine costs in fuel a half-cent per horsepower-hour; a horse's food costs eight and one-quarter cents. No wonder that 75,000 gas-engines, representing the power of half a million horses, were sold to our farmers last year.

And the vital food-needs of men will hasten the passing of the horse. We are now tilling nearly all of our land that can be cultivated. Every work-horse displaced by tractor or automobile or engine represents an annual saving of more than $50 in grain and forage, which may be converted into food products for the maintenance of the human race. If half of our work-animals could thus be dispensed with, we should effect an annual saving of $600,000,000, an amount equal to our entire wheat crop.

The revolution is coming quickly. The machines we need lie mostly ready at hand. Their general use is only waiting for the cheaper power that we now have in promise. There has been but one great gap, and progress at last is coming where it was needed—in plowing, the work that consumes 60 per cent. of all the energy spent in tilling the soil. It seemed an epoch-making thing when Thomas Jefferson, Jethro Wood, John Deere, and James Oliver—all Americans—fashioned the modern plow from the crooked stick that for thousands of years was used for stirring the earth. But this tool, perfect for the use of a single man, is no longer enough. The interest of inventors and manufacturers now centres in the creation of plows that will do the work by wholesale—meeting by quick work the urgent needs of our sudden-massing populations. And we not only need plows that will break up rapidly and well the great fertile plains of the new Northwest and Southwest. There are the broad areas of the less productive lands that need not only efficient management and systematic organization, but cheaper plowing than any yet known. Foreign competition is keen and intelligent in agriculture above all, and for the future our methods must continually improve to meet it. Wholesale methods, which means mechanical methods, are the order of the day.

It is an unfortunate situation when a man of big capacity and ability to handle large propositions finds his activities restricted to a small field. So far as he goes he makes a complete success and only needs the opportunity to make a record in a larger way and add to the wealth of himself and the community. Unfortunate as such a situation may be, it does not compare with that of a small man on a big ranch. We have all seen the pitiful picture of a man without capacity to handle big things, and with small capital, failing even to make both ends meet on a proposition that calls for genuine bigness. Too many people make the mistake of buying more land than they have capacity to care for, and the result is a dismal failure. The little ranch well tilled is far better.

Citrus and Sub-Tropical Fruits

COTTONY MOLD OF LEMONS.

By C. O. Smith, University of California, Pathological Laboratory at Whittier.

DURING the past few years this trouble has been on the increase, often causing heavy losses among lemons during the curing process. The disease usually appears at the beginning of the rainy season and continues during the winter months, its abundance being determined roughly by the amount of rainfall. The increase of the trouble also seems to have followed the increased use of leguminous cover crops. The reason for this will be pointed out later in this paper. Already a considerable study has been made of the fungus, and while there yet remains much work to be done, especially on control methods, it is desired to give in some detail an account of the work thus far accomplished.

The Cause of the Disease.

As we have already suggested, a fungus (Sclerotinia sp.) is the cause of the decay, the infection of the fruit taking place from spores produced in the orchard. In the packing house only the sterile form of the fungus is found and appears as a dense, widely spreading, white cottony mold-like growth (Figure 1) that quickly spreads from the original centers of infection to the surrounding green fruit in the boxes. The fungus is very virulent, and a large mass of green fruit may very quickly become decayed. The fungus secretes a substance, probably oxalic acid, that softens the tissue and prepares the way for the mycelium to penetrate the healthy lemon. Because of the soft, mushy character of the decay this trouble is one of the most disagreeable with which the workers have to contend. After a time, in this white growth may be seen rather small, hard, roundish, black bodies, known as Sclerotia, which are attached to the lemons. These Sclerotia form a very important stage in the life history of the fungus. No spores of this fungus are produced in the packing house, and it therefore follows that this fungus should be easier to control than the blue or green molds. The mycelium is very virulent, and healthy fruit in boxes beneath those containing the disease are very often infected. Thus the disease may spread through a whole stack. The mycelium has been known to make its way through as many as a dozen thicknesses of newspaper and infect healthy fruit. It should be noted, however, that there was considerable moisture in the paper and it was probably well saturated from the decaying fruit much of the time.

Life History of the Fungus.

The life history of this fungus has been well worked out, and consists of three stages which have different appearances and perform different functions. The vegetative stage is the white cotton-like growth so common in the packing houses. This growth has no spores, but can spread very rapidly and has the power to infect healthy fruit simply by coming in contact with and spreading over it. A softening of the tissue takes place, after which the mycelium enters and grows through the tissue. In this white growth the black bodies mentioned above and known as Sclerotia are produced. These are nothing more than a very solid, dense mass of mycelium, so formed that it will resist long periods of hot, dry weather or cold freezing conditions of the eastern states. After these bodies have gone through a period of rest and the favorable wet weather of winter has come they revive and again become active. When conditions are favorable one of two things happens: The Sclerotia may send out a fresh growth of mycelium, the vegetative stage, which could easily infect a growing cover crop, or they may develop the spore stage of the fungus. This last is accomplished by sending out a small, funnel-shaped, toad-stool-like growth which has a roundish cup-shaped disk, technically called an apothecium, and a more or less evident stem (Figure 3). In these apotheca are produced the spores. See (Figure 5.) These are formed in rather long, cylindrical sacks, or asci. Hence the spores are called ascospores. These spores are very small and are easily scattered by the wind. They are very numerous and can be seen leaving the fungus as small clouds of dust. They may be carried to the lemons or may infect the cover crop. The spores on the lemons are probably carried to the packing house before any great amount of infection takes place. Germination, when conditions are favorable, will take place within twenty-four hours. Infection is thought to take place through some injury or through the button end of the fruit. When once these spores have gained entrance to the lemon through the button or some abrasion, they produce the cottony mold stage, which in turn may readily enter healthy lemons which are free from abrasions.

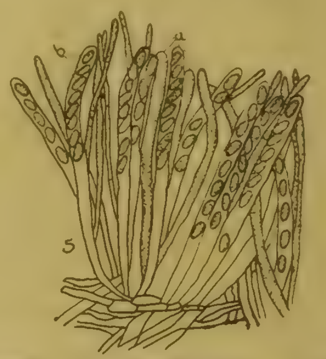

Figure 5. Microscopic section through fruit body of Cottony Mold. (a) Asci, (b) Ascospores.

The Relation Between a Cover Crop and Cottony Mold.

There is no question but that the disease has increased with the increased growing of cover crops. The same fungus not only occurs in the fruit of the lemon, but is also a parasite on certain cover crops, vetch being by far the most common host. While this fungus is very common on vetch, the injury it does to the crop as a whole is negligible. The dense growth of vetch affords a suitable place for the fungus to grow and it also occurs as a saprophyte on any dead or dying vegetable matter. Under the vetch the Sclerotia are produced in great numbers and can readily be found in infested orchards with very little searching. After a period of rest, they are ready the following season, when the winter rains

begin, to develop the spore stage, as already described.

Not only does this fungus appear on lemons as a watery rot, but it is also an active parasite on the twigs and branches of both lemon and orange trees. This is well illustrated in (Figure 2,) where the hard Sclerotia are shown as roundish bodies. From these, under favorable conditions, the spore stage can be produced. Thus, the spores would have easy access to the green lemons. It is probable that these spores could stand considerable drying before they would fail to germinate. This diseased condition of the branches of lemon trees is fortunately not very common.

We have, therefore, two distinct and different methods of infection; first, from the spores that develop from the Sclerotia formed under the cover crop, and second, from the spores developed in the diseased lemon twigs. Either, or both of these sources of infection may be present in an orchard, but by far the worst and most common is that from the cover crop.

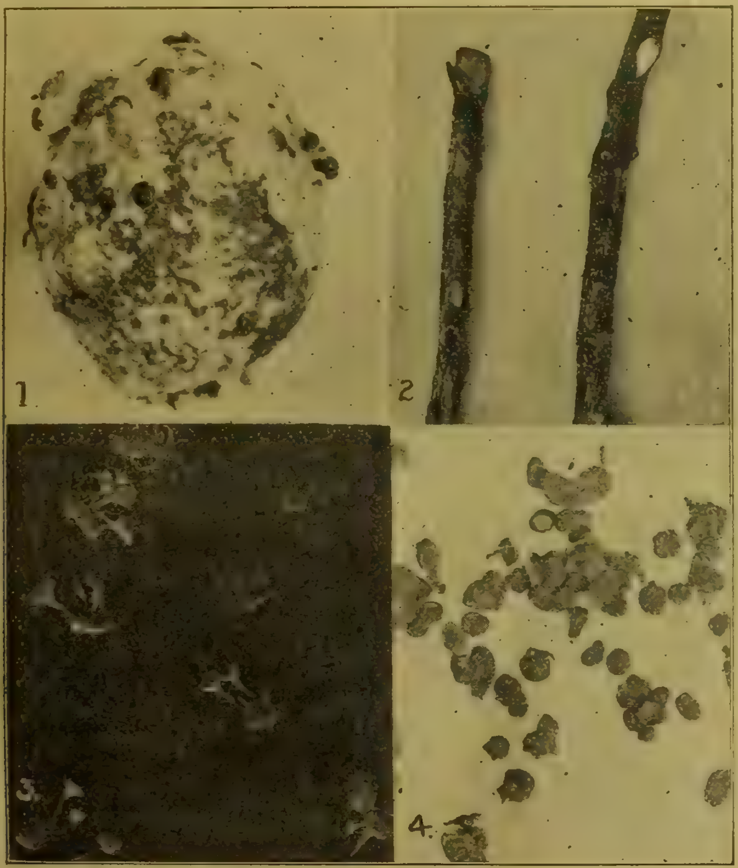

Figure 1. Lemon with Cottony Mold showing Sclerotia, or resting stage. **Figure 2.** Lemon twig showing Sclerotia. **Figure 3.** Ascosporic stage of Cottony Mold. **Figure 4.** Sclerotia taken from a diseased lemon.

Its Relation to Similar Parasites.

The cottony mold (Sclerotinia) belongs to a well known group of fungi, many of which are active in causing plant diseases. Some of these fungi attack various berries and fruits (the dreaded brown rot of the peach and plum being a member of this group), while others are found on various cultivated plants, especially small seedlings. Many and varied plants belonging to widely removed families may serve as hosts for different members of this genus. In our work, we have found this disease on celery, tomatoes, cucumbers, egg plant, alfalfa and fruit and twigs of lemons and twigs of oranges. It is not known definitely whether the fungus from these various sources is one or several distinct species, as the classification of this group is very obscure. Further study, however, is expected to determine this fact.

Laboratory Experiments.

Research work upon this fungus in the laboratory has established the following facts:

First.—Repeated inoculations have proven that the cottony mold is caused by the sclerotinia fungus and no other.

Second.—The white cottony filaments of the vegetative fungus are able to enter and destroy a perfectly sound lemon at any point of contact, no abrasions being necessary.

Third.—Every attempt to inoculate the healthy, uninjured skin of a lemon with the spores from the perfect stage of the fungus has failed. When spores were applied to the entire fruit with an atomizer, they germinated and entered the lemon only through the button. The buttons of green lemons were infected much easier than those of tree ripes or tent cured fruit.

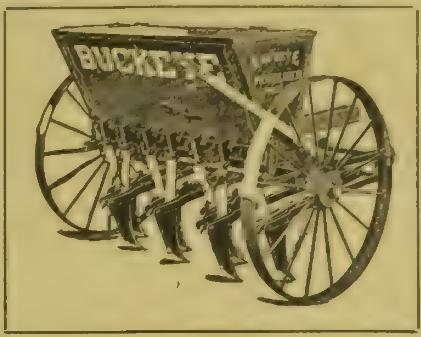
Fourth.—This fungus has repeatedly been carried in pure culture through its entire life history from ascospore to ascospore in the laboratory.

Fifth.—Ascospores developed from pure cultures, isolated from a diseased Valencia orange branch, produced the typical cottony mold when inoculated by punctures into lemons. The same results were secured with the ascospores isolated from the Sclerotinia from diseased tomatoes.

Control Measures.

On account of the nature of this fungus, it is necessary that control measures should be carried out largely in the packing house, for we certainly cannot afford to give up our vetch cover crops. The logical point to fight the trouble is the washing tank. The disinfecting copper sulphate solution, as commonly used in fighting the brown rot, may not be effective against the cottony mold, for two reasons: The cottony mold spores are more resistant to blue stone than are the brown rot spores, and the solution may be weakened more than is realized by a slight alkalinity of the water. We have demonstrated in the laboratory that a solution of blue stone, one pound to two hundred and fifty gallons, will not injure lemons, while one pound to a thousand gallons is commonly used for brown rot control. To control the cottony mold it is necessary to use a solution of copper sulphate strong enough to kill both kinds of spores. This will mean a wash water approaching more nearly the limit of lemon endurance. In order to accurately mix and to prevent the copper sulphate solution from being weakened by the alkalinity of the wash water, it may be necessary to first neutralize the water before adding the blue stone. This can easily be done with a little acid without affecting the metal tank, provided the exact composition of the water is known.

The Laboratory is now working on a study of these waters and hopes to be able soon to give more explicit directions in regard to particular types of wash water. A further study of control methods is to be undertaken this coming winter.



For Use in Orange Groves and Vineyards
there is nothing better than the

Buckeye Fertilizer Drill

Set of Plates Furnished FREE with
Each New Drill if Desired

For Sowing Vetch and Peas

We have sold a great many carloads of these drills in Southern California and the Buckeye is now recognized by orange growers and fertilizer men as the best drill made for handling commercial fertilizer. Its low wheels, proper sized box, and large feed openings giving great capacity when desired, make it especially adapted to orchard use. This drill also made to successfully handle tankage.

APRICOT SCALES.

By E. O. Essig, Santa Paula.

IT is now a matter of fact that the apricot grower must take some definite steps towards insect control, for inspection has shown that not only are trees in many orchards suffering from scale pests, but that a great deal of fruit was this year nearly ruined by black smut caused by these insects. It is very important that the dried fruit be clean in order to get the highest market price, and it is also important that all orchards be cleaned up in order to realize a good crop. In citrus districts many, if not all, of the orchardists are making a campaign against Black Scale. Apricot growers must do the same thing. But among the apricot orchardists there must exist a co-operation in this very work. I am informed that in a certain district, which is strictly an apricot growing section, that a few progressive growers have endeavored to persuade their neighbors to join in the work of spraying for scale pests, and that their efforts have been disregarded to such an extent that they have become discouraged in the undertaking. It is the duty of this office to take up the matter of just such a case and see that all infested orchards are cleaned up and that the efforts of those who desire to do this are not in vain. If one man sprays and his neighbor does not, it simply means that the one who sprays must continually do so because of reinfections from his neighbor's orchard. Far better is it that the growers comprehend the evil in time and co-operate willingly and intelligently in the work of subduing scale pests. It is upon this supposition that I write this article, and offer these suggestions for the best methods to be used in this work.

Scale Pests.

Three serious insect pests exist in large or limited numbers in nearly every apricot growing district of Ventura county. There are other pests which exist elsewhere in California, and are being kept out by strict quarantine methods.

Black Scale (Saissetia oleae) is common in nearly every orchard bearing fruit of any kind. It works upon citrus, olives, apricots, plums, apple, peach, prune. Also on oleander nightshade, rhus (schumac), ceanothus, buckhorn, pepper trees, and many other cultivated and wild shrubs. It is, therefore, a constant nuisance and becomes especially serious to citrus and apricot growers. Some have said that there is little use to fight it in an orchard because it is in all of the mountain brush. This is a serious menace, but we can keep it down in our orchards, and because it can be done, we are compelled, and it pays big, to do it.

Courtesy Porterville Chamber of Commerce.

A Tulare County Big Tree.

Citrus trees can be profitably fumigated, but the stiff branches of the apricot trees makes it almost impossible to cover them with a fumigator's tent without tearing it to pieces. Then, too, the apricot being a deciduous tree, it is much more adapted to spraying than the evergreen citrus tree, for two reasons: First because the fallen leaves are no hindrance in getting the spray all over the limbs and body of the tree. Second because the tree is more or less dormant during the winter months and can stand a much stronger solution than the foliage of a citrus tree.

This scale is easily told by its color when fully grown and by the more or less distinct "H" upon the back of the young, which vary from a light yellow to a reddish-brown color.

Apricot Scale (Eulecanium armeniacum) is limited in its distribution in this country, but wherever it occurs it has become a greater nuisance than any other apricot insect pest. It is a soft-brown scale, rather flat and often overlaps its neighbor. It attacks all parts of the tree, but usually prefers the last year's growth. When fully grown it is about one-quarter inch long and two-thirds as wide. At present it is known only in the Santa Clara Valley.

Prune Scale (Eulecanium pruinosum). Also commonly known as Walnut Scale, and more properly known as Frosted Scale, because of its frosted covering, is of little consequence at the present time. In shape it resembles the apricot scale, but is a great deal larger and is covered with a whitish-powdery wax. Many of the adults lose this covering and appear dark brown. Its work is similar to that of the other mentioned forms.

Similarity.

These three scales are very similar in general appearance and in manner of growth and food habits. All belong to the family Coccinae which includes all unarmored scales. Their coat is simply a thickened epidermal layer which hardens as the insect ages. In methods of eradication it is therefore necessary to take this in consideration, for the spraying must be done before the coat becomes too hard and resistant.

All lay eggs beneath the shell and as the young hatch they first settle along the midribs of the leaves. The broods are usually somewhat even so that at one season of the year all are of a certain age, but this is not always the case especially near the coast. Whenever the brood is uneven it is sometimes necessary to spray twice the same season in order to get all of the insects at the right age for successfully killing them. The young appear with six legs and move about very freely, settling at first on the leaves, but before these begin to fall the young move in on the new growth and settle down to one place. In case of the Black Scale, the young gradually lose their legs as they grow and the adults are entirely destitute of any locomotive power. But in case of the apricot and prune scales they retain their legs throughout their entire existence and move at will, although they are wont to remain in one place all of the time. Males alone have wings and can fly, but they do not feed at all and do no damage.

Destructiveness.

All scale pests live directly on the sap of the tree, and thereby greatly reduce the vitality and bearing power of it. They also secrete a honey dew which is exuded over the foliage and fruit of the tree. This honeydew is the feed of a black fungus, and it grows wherever it is found. The smut then depends upon the amount of honey dew, or more directly upon the number of scale insects upon the trees. In many orchards this smut has greatly reduced the selling price of the fruit—and by stopping up the breathing pores of the foliage has threatened to destroy the crop. The only remedy is to get rid of the scale.

Modes of Distribution.

These pests are usually distributed by the aid of some natural or artificial means outside of themselves, for only the males fly and in many species the females lose their legs when young. Most always this is accomplished, when the young have the power of locomotion, by the wind, birds, and ants, and also by means of boxes, pruners, pickers, cultivators, etc. The young crawl on anything and have been found upon the legs of birds, and even upon ladybird beetles. Due to their extreme smallness the wind blows many of them from tree to tree, so that they are rapidly distributed from one orchard to others.

Boxes or pickers from other orchards carry the young, and cultivators and horses distribute them over the entire orchard. It takes only a few individuals on a single tree to infest, not only a single orchard, but the entire community.

Methods of Control.

Under these methods we may sum up all under two heads as follows:

Spraying.

For these scale pests a contact insecticide is necessary. There are many such [These will be given in a later issue in a spraying calendar now in preparation.]

Time for Spraying Scale Insects.

The important thing in spraying for these scales is that it be done before the insects get too large. The smaller they are the better the results and the less often it will be necessary to spray. But it is also important that all the eggs be hatched before the spraying is begun in order that none appear after the application. This matter is very well regulated by nature. As soon as the leaves fall is the time to spray. In some orchards all of the leaves are not off until November. In such cases do not wait until all of the leaves are off. Spray before the first of November at the latest. Any time after the first of September is all right, and the sooner after this date the better.

Essentials in Spraying.

One of the most important factors in spraying is pressure. Without it the work can only be done unsatisfactorily. With it all portions of the tree, including every small crevice may be drenched in such a way as to do effective work on the scale. Good work cannot be done without at least 150 pounds and 200 pounds will give much better results. By this it is clearly seen that a power pump is almost necessary, but the work can be done by hand power, although it is very much slower and less efficient. Wherever possible it would pay a number of orchardists to get together and buy a good power pump. The cost would be about $300 and on a large acreage this would be saved the first year.

In all work a good agitator is desirable and necessary in most operations, especially so when using dis-

tillate, Bordeaux Mixture, or Lime-Sulfur Sprays. It can only be had on a power pump to fit all cases.

The cost of labor is an important factor in spraying work, often equal to many times the cost of chemicals, and in doing poor work this is just as great as when good work is done. See to it that the men handling the nozzles are thorough and regular in methods of application. This can be ascertained by keeping a careful record of the number of trees each tank will spray.

The work cannot be done when the trees are damp or when a strong wind is blowing.

Parasites.

For Black Scale we have the African Fly (Scutellista cyanea) which has been distributed over the entire county for a number of years. It is an egg parasite and due to the fact that a greater part of the year the scales are not laying eggs, the parasites die off for the want of food. For this reason this parasite can do effectual work for only one or two years and then the scale gets bad again. After many years of trial, it is generally conceded that this parasite can never cope with Black Scale and too much stress should not be laid upon its value as such. Spraying deciduous trees and fumigating citrus trees are much more effective and lasting.

This year we are introducing two new parasites for this pest, both of which work upon all stages of the scale. It is the belief that if these can be established they will do excellent work, but it will take several years to demonstrate this.

For the Apricot Scale we have only one efficient parasite which is known scientifically as Comys fusca. The adult female deposits her eggs into the young scales as soon as they hatch from the egg.

In the worst infection in this county 500 colonies of this parasite were introduced from the State Insectary. From this point it will naturally spread with the scale. Other colonies were liberated in the apricot districts of the county, especially at Moorpark.

The success of all our efforts depends largely upon the co-operatiou and support of the growers themselves.—E. O. Essig, Commissioner, Ventura County.

VOLCANIC NITRE ROCK FERTILIZER.

THE Fertilizer Control again finds it necessary to call attention to the pernicious activity of vendors of worthless fertilizing materials. We have at hand a business card of the St. George Placer Mining Company, of Oakland and San Francisco, entitled, "Natural Volcanic Nitre Rock Fertilizer," (non odorous) with the aditional statement: "Carrying a high percentage of soluble salts, i. e., nitre, potash, phosphates chlorides, bromides and iodides." On the reverse side are several chemical analyses said to represent the natural volcanic nitre rock taken from the properties of this company and from adjacent fields.

We have examined a sample of this material received from a prospective purchaser of stock in this company and find it to be not worth the cost of spreading on the fields as fertilizer, to say nothing of the purchase price.

We learn from Mr. W. C. Riddell one of the chemists quoted that of the three analyses only the first applies to a sample taken from the lands of this company. Of the remaining two it should be said that because of their high content of sodium chloride they would probably do more harm from a fertilizing standpoint than good, if applied in the raw state. As to whether these latter could be economically manufactured into high grade nitrate of soda and complete with the comparatively cheap nitrate from Chile cannot be definitely stated. Furthermore, it is of no present interest as to whether or not they could, but it is quite certain that the only material from the lands of this company represented by analysis could not be economically used as a fertilizer either before or after refining.

Mr. Riddell further informs us that of several analyses made by him of samples submitted by this company, the only one containing more than 1.5 per cent nitrogen was the one published and that such publication is necessarily a misrepresentation of the deposit as a whole.

So far we have heard of no actual sales of this material as a fertilizer and are inclined to believe that operations have been confined to selling stock in the company.

All persons are, accordingly, warned that the evidence presented as to the value of these deposits is, to say the least, misleading and that investments in such an enterprise should only follow an investigation by a properly qualified expert in the employ of the investor.—John S. Burd, Chemist in Charge, Fertilizer Control, University of California.

PRUNE OUTLOOK.

By J. W. Jeffrey, State Horticultural Commissioner.

I am informed upon the best of authority that the world's supply of prunes this season will be very short. This information comes from both growers and dealers, and there seems to be no doubt that to every civilized country on the globe, California prunes will find their way during the next year. Consequently, a rare opportunity is offered to demonstrate the superiority of our product.

Motives of self interest, as well as state pride in enhancing the value of a product for which there is a world's demand, should prompt the grower—the man makes the crop—to give every essential detail of production the greatest consideration. Every step in the handling and curing should be taken with great care and intelligence in order that results may be satisfactory, and place California in a position to compete for the trade at prevailing high prices. The maintenance of good prices should be the aim of growers, and the only certain way to realize these hopes is to keep up the standard of quality to the very highest degree, and this stand is deserving of careful consideration.

Growers whose intelligence and progressive spirit can always be relied upon in real business emergencies need no urging in the way here suggested. But many prune growers do not come under this progressive category and their policies this season, if continued, may do lasting harm to the trade. Should the reputation of the California prune this year receive a set-back as the result of careless or indifferent methods of curing, it will undoubtedly have permanent injurious effect upon the industry.

To accomplish the best results, growers are urged to exercise the utmost care in handling their prunes, seeing that the fruit is carefully lye-dipped, then rinsed before put upon the trays. The fruit should be thoroughly and properly cured before being taken up, and all slabby and defective fruit should be discarded. In most cases the growers use too much lye, which results in making the prunes red in color and more or less puffy. The quantity of lye should be limited so that the fruit will show no checking except perhaps in the very hardest prunes. Most growers shake their prunes off too green. The best prune is that which drops of its own weight from the tree. The keeping quality is much improved by rinsing after the lye dip.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

HIS ROYAL HIGHNESS.

By Mrs. Minna E. Sherman.

WITH what arrogance the head of the dairy herd rules the barn yard when unrestrained of his freedom! It is not worth the risk of human suffering to let him roam at will, for a sire that will not fight wickedly, lacks prepotency. The best of them, from a breeder's standpoint, is the worst of them, from the standpoint of making him a pet and companion. He is a gentleman of great dignity and we must be equally reserved if we are to handle him with firmness. It is a case of severe justice tempered with mercy.

Beware.

The pictures that appear sometimes in the agricultural press of children perched on the back of some great brute, should never be printed. They merely encourage some foolish unthinking person to try to risk the precious babies for an idle whim. The animal that today is gentle, tomorrow may gore his master. The supposedly gentle sire and the supposedly unloaded gun have cost too many lives. Do not be pigheaded enough to suppose you have the only gentle, affectionate, trustworthy animal, for none of them are safe. Like the good Indian the absolutely gentle sire is dead.

Separate Quarters.

Wallace speaks of the former practice of killing the males on the Island of Jersey when they were three years old as a precautionary measure for safety of human life. While today we do not sacrifice a sire at three years of age, if we are wise we confine him in special quarters. At an earlier time one way was to handle this unruly member of the herd by putting him to work on a treadmill. He could cut or grind feed or run a separator. Still earlier he was yoked up with an ox to haul out the manure. These things we have had to give up as the ordinary hired man does not have the necessary experience to handle them. He rarely stops long enough to learn very much of any one thing.

Controlling.

The youngster should have a ring placed in his nose when a yearling, with a halter on the head and he should be handled with the staff the same as an older animal. The halter for the younger animal has a snap that fastens into the ring, on the end of a strap that passes directly up the center of the face to meet a strap coming around the crest under the horns. The three strap ends are joined on to a heavy iron ring directly on the forehead. When the animal reaches the age of three his horns should be taken off completely. The halter that he then wears should be made like a cow's halter with the addition of the heavy strap down the center of the face, having the snap on it to fasten into the ring.

Pens.

After the age of two His Majesty should be kept in a yard with a sleeping and feeding shed in one corner. The yard should be good-sized and have a strong board fence around it. He should be fed there and kept there all the time. One man should attend to him as far as possible. When it is necessary to change him to some other place avoid rushing him around. More animals are made vicious by running them with a rope swinging over them than in any other way. Even a two year old, if he is any good, will turn on a man on horseback if he is hustled along faster than he cares to travel.

Moving.

Open the door of the small yard and come away a short distance. In a few minutes out he will come, and the first thing he will do, will be to drop to his knees and throw dust over himself. Let him play the dunce generally for a few minutes until he is tired of it. When he stops for a few minutes open the next gate and when he trots out have some one gently shoo him from the wrong direction and he will go readily where you desire. When necessary to drive him any distance a couple of cows turned out with him, will make it easy to drive the bunch along.

Precautions.

The man that is handling a mature animal should always have a good strong pitchfork at hand to discourage promptly any tendency to playfulness on the part of His Majesty. The strong bull staff with a heavy clip is necessary to handle with safety any mature animal. While it is often recommended to have a good blacksnake at hand, I think them little use if the animal is really vicious. The only control possible is to keep him from striking by having something with which to hold him at bay. Never trust His Majesty by turning your back to him. If he does not come at you that time, just remember he is like a note at bank, accumulating interest for the next time.—M. E. Sherman.

There are too many people raising pigs for market today who forget that the most profitable porker is the one raised in four to five months and sold without fattening, at a weight of 100 to 150 pounds.

PREVENTING SWINE DISEASE.

Every feeder who has taken care of hogs knows by experience that it is easier to prevent a disease than it is to cure one that has already attacked your animals. Every pig and hog is supplied by a natural force for resisting disease. The vigorous, healthy hog, with all of its organs in proper order for performing its necessary functions, is least liable to take a disease and will throw off most troubles which the weak hog falls an easy prey to.

Part of the trouble comes from allowing the hog to get out of condition. The hot weather dries up the pasture and when the juices of the plants are meager or deficient, constipation follows very frequently, and with this trouble they are free to invite most any kind of disease that comes along.

Therefore one of the necessary preparations for preventing disease is to stop constipation. How will you do this? says one. If they are in bad shape before they are observed, it may be necessary to give them a dose of salts, but if it is just starting in or if it has not commenced, feed a small portion of oil cake meal in their slop, or if you have sweet corn ready to cut, give them stalk and all; it will keep them in good condition. Care should be used to give them only a small ration at first, until you have gradually increased the quantity thrown to them to as much as they will eat after a few days.

A change of food should always be introduced gradually, to prevent trouble of the bowels, as it would be easy by overfeeding to start up scours, which would cause loss of flesh and injury. It often occurs that hogs are required to take their water from a creek or pond that dries up during the hot spells and is not noticed when the farmer is busy with his crops and harvest, and this causes constipation. There is no success attainable without watchfulness and work. You cannot expect the best results unless you give good service to your animals. It pays you to do it, and it ought to be done by every progressive breeder and farmer.

Look after the pigs closely and it will pay you well.

Be careful in making a purchase not to introduce a new pig into your herd until he has been quarantined, as this is often the way disease enters a herd. The pig may have been perfectly healthy when he left his owner, but during the passage he may have taken in the germ that results in disease, and, therefore, care should always be used in thus protecting the balance of your herd.

The excessive heat that has prevailed over the country the past month has been pretty hard on the hogs and pigs, especially where no proper shade is provided. The hog, as we have frequently said, should be taken care of and provided with shade, and if there are no trees or bushes, it should be arranged by temporary sheds. As a preventive of disease it is partial insurance to keep the hog in strong, vigorous, healthy condition, with all of his organs doing their natural work, and nothing is so fatal to this as constipation. It is the forerunner of so much trouble that it should be avoided by all proper means. It usually comes through inattention during this season of the year, when farmers are busily engaged with their harvest and other farm work.—American Swineherd.

Cream Separators, all sizes and prices. O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.

KIDNEY WORM.

The disease that is sometimes called "kidney worm" and is supposed to be caused by small worms in the kidneys which weaken the hog so that he loses control of his hind parts, is more properly called rickets. This disease is caused by improper nutrition. There is a deficiency of mineral matter in the feed. Prevention then for such troubles is properly to feed the hog. It is gradually beginning to be recognized that the mineral constitutents are just as important in a ration for swine as are the protein, carbohydrate, fat and water. Furthermore, a hog should have various kinds of mineral water. The cure for this disease is said to consist in feeding lime or lime water and injecting 1-30 of a grain of strychnine hypodermically on the inside of the thigh. In the case of swine, however, one ounce of prevention is always worth more than 10 ounces of cure.

It is possible that our inquirer by treating his hogs with soft soap introduced into the system the necessary mineral ingredients that were lacking and thereby cured the disease. The writer's recommendations are that hogs should at all times have free access to various mineral substances such as salt, charcoal, air-slaked lime or ground lime-stone, bonemeal or rock phosphate, and wood ashes. Besides these, a hog will also relish coal cinders, clean soil and various other things that may be picked up if the opportunity presents itself.—Breeders Gazette.

HORSE NOTES.

Teach a team to pull a light load right and they will pull a heavy load right.

Never scold a team for breaking an evener.

Load light at first, and heavier afterward.

Never pull a team when they are out of breath.

Do not allow a team to stop at will but stop them soon afterward.

Short stops and often, is the rule for resting horses.

As a rule, when horses are overdone it is done inside of a few hours.

A horse will seldom run away if he will stop when told to do so.

It is all right for your horse to have speed if you never find it out.

Move a little yourself to get started, instead of asking your team to make up lost time.

A horse, like a boy, should be taught to mind because he wants to instead of because he has to.

The heavy, well muscled jaw is a sign of strength in a horse.

A horse is no better than the feet he stands on.

The way to get a good, fast walking team is to not overload and not trot them. Two 1200-pound horses, on a fourteen or sixteen inch plow are overloaded. They are loaded too heavily to walk three miles an hour. Three horses on the same plow will make the work lighter and reduce the cost of plowing.

ONE REMEDY.

"My wife is getting awfully strenuous," remarked Whiffles. "Yesterday she broke a plate over my head. What would you advise me to do?"

"Well," replied Sniffles, "you might buy cast-iron plates."—Judy.

No Hoof, No Horse

U. S. statistics show that 80 per cent of all horses are lame and that 80 per cent of the lameness is caused by hard and contracted feet. As a hoof softener, toughener, nourisher and grower there is nothing equal to

Eshelman's Wool Fat Hoof Healer

A horse's hoof is from 60 to 70 per cent water. Grease and water will not mix. There is no grease about Wool Fat. It mixes readily with water, is very penetrating, and while a great medicine of itself, it also acts as a vehicle to carry to the afflicted parts the other medicinal properties of the HEALER. It is absorbed into the skin and gives natural stimulation and nourishment to the hoof. There is nothing that can compare with it for this purpose, nor as a remedy for contracted hoofs, split hoofs, quarter cracks, mud fever, corns, grease heels, and for all kinds of sores and cuts anywhere on any stock. If you have tried it, you know that this is true. If you have never tried it, it will surprise you with its power as a healer and restorer. It is not a new remedy, but has been on the market in the East for many years, where it has given the greatest satisfaction.

4 oz. package, 25c; 12 oz., 50c; 32 oz., $1.00; 5 lb. pail, $2.00; 10 lb. pail, $3.50. It is easy of application. Directions with each package.

TRIAL OFFER.

We will send you a 2-lb. can, use it 15 days, and if satisfactory, send us $1.00. If not, write us to that effect, and you need pay nothing. We take all the risk, you just try it. Send for it today.

Small Fruits and Vegetables

THIS MONTH.

NEARLY everything may be planted in the garden this month, but especial attention should be given to onion sets, peas, wax or green beans, cabbage, cauliflower, celery and rhubarb roots. If planted now these will give vegetables in time for holiday eating. A little extra care will need to be taken in the planting for September will have hot days which will crust the soil so that some of the smaller seeds, especially lettuce and radishes may fail to break through. A mulch of fine strawy manure or a protection afforded by coarse sacking material thrown over the ground, with a little care as to regular sprinkling, will bring success.

INTRODUCTIONS FROM THE ORIENT.

A bulletin recently issued by the U. S. Department of Agriculture says the Orient still remains almost unexplored and unknown as to its agricultural treasures, and economic exploration rather than scholarly research is needed to make that land known and its value appreciated, and to secure for the United States most useful agricultural introductions. There are to be found some of the best cultivated varieties, developed by the combined efforts of man and nature for thousands of years; and there, also, are almost all of the wild types which our prehistoric ancestors utilized in producing the cultivated crops of our time.

The report under review deals especially with the useful plants which should be introduced into the far West and Southwest from that portion of the Orient known as Palestine. Already the Smyrna fig and Thompson's seedless grape, among other fruits, Kherson oats and hard Russia and Turkey wheats, among cereals, have been introduced into the United States and made it possible to extend cultivation to regions heretofore untilled, and it is believed that what has been done in this direction is but a splendid beginning of a most promising future possibility.

This land closely resembles California except as to the extent of area; in fact, is practically a California reduced to about one-twentieth in size, but markedly similar in general topography, climate, vegetation, and agricultural and economic possibilities. Like California, Palestine is longest from north to south; it, too, has very high mountains, and very deep depressions. Passing from west to east in either, there is the littoral region along the coast, the zone of hills and plateaus, then the long valley in each, while still farther east are fertile plateaus, finally turning into arid or desert lands. Each, too, has a dry warm season, and a humid and more temperate one. Palestine is even more favored than California with regard to winter temperature, for although as in California, the thermometer rises high in summer, it rarely drops in the winter to the freezing point. Snow is rare even on the plateaus and farmers in almost all parts of the Holy Land are safe from any damage by frost.

Curiously enough, the list of flora of this small territory of Palestine includes approximately the same number of species as that of California—about 3,000. In both sections evergreen shrubs predominate. The same forms of vegetation, often the same genera, are found on Mount Tamalpais, California, and Mount Carmel, Palestine; the maquis formation of Palestine is to be compared to the chaparral and chamiso of California; and the forms of vegetation of the Lebanon and the Hermon mountains are much the same as those of the western slope of the Sierras. This analogy of the flora of Palestine with that of California justifies the expectations of the best results from their introduction into the last named state.

Among the large number of wild species and varieties found in Palestine is the wild emmer, from which our cultivated types of wheat and related cereals seem to have been derived. The author of the paper found large areas on the slopes of Mount Hermon covered with this cereal and it was found growing near an eastern branch of the Jordan, 500 feet below sea level, and upon the slopes of the mountain, 6,300 feet above sea level, or in the zone of alpine plants. By selection and crossing of this wild cereal, which prefers poor, rocky, shallow, dry soil, and thrives without any cultivation, it is thought possible to produce new races which will be very persistent and very hardy, and to extend the cultivation of wheat to regions where, on account of the low quality of the soil and the severity of the climate, it is at present impossible to produce it.

The study of this and other wild types of our cereals does not confine itself to a merely botanical and historical end, but becomes intensely practical as an economic, even social problem, as its ultimate aim is to produce a little more bread at a little less expense, and to render this production possible where, up to the present time, it has been impossible.

GOOD ROADS REDUCE DISTANCE.

The good road moves the remotest farm right next to the market. A farm twenty miles from the market on an all-the-year-round good road is nearer market than a farm seven miles away on a bad road.

In the Dakotas and Minnesota and Manitoba they haul their product thirty and forty miles; but they can haul it only when the roads are dry in the early fall; and at that season the price is lowest. The farmer along the good road can command the best price by hauling only when the price is best; and he can also raise the produce that gives biggest net returns. If you would learn why a whole family can live and live well off an acre in Holland and Belgium and France, when a family often fails to live well off a hundred and sixty acres in America, study that table of farm averages in relation to the good roads.

The Armsby Company's cannery at Yuba City, Sutter county, is running later than usual this year.

The Ornamental Garden

THIS MONTH.

BULB planting time for winter blossoms is here or nearly so, and preparation for the event should be thorough. If the ground devoted to bulb culture has been thoroughly mulched it may now be spaded up and put in the best of tilth. Easter lilies and many others are not yet in the market but the earlier varieties may now be had. Early blooming gladiolus should have been taken from the ground and properly ripened before this time so they may be planted at once. Plant two or three inches deep, and after covering with soil a covering of pulverized manure is valuable. Freesias and some other lilies, if planted now, may possibly give a Christmas growth. Amaryllis belladonna may be divided as soon as the bulbs have had time to rest after blooming. Belladonna Minor finished blooming some time ago and the Major is just now in full bloom in many gardens, but during the month and before the green leaves start, they should be divided.

Golden glow and goldenrod are now in their glory and need plenty of water and a bit of fertilizer to give the largest bloom.

Roses which were deprived of water during August may now be cut back heavily and a fairly strong application of blood meal made and they should be irrigated thoroughly. If this is done Thanksgiving and Christmas bloom will be assured.

Violets may still be started though it is a little late.

Eucalyptus, cypress, acacia and pine seed should now be planted. The blue gum might better be planted later in the month for owing to its strong growing proclivities it might be too large before the spring setting unless transplanted to pots or cans before put into the field.

For fall and winter blooming sow the following annuals; pansies, stocks, cosmos, coreopsis, centaureas, cinneraria, and sweet peas. Other annuals which were sown last month may be potted or put into open ground now.

POPPIES EARLY ANNUALS.

Among the earliest and most satisfactory of our annuals are the poppies, in all their wonderful variations. They are perfectly hardy and germinate freely. Sow them thinly where they are to grow. They should not be closer than three to four inches each way. They last for three weeks or more and can be followed by aster plants, working the beds over and applying a little fertilizer when transplanting the asters, and a little more just before their season of bloom. There are many grand new strains of asters that rival the chrysanthemum, and they are one of our most satisfactory annuals. Seeds should be sown indoors in March, but it is better, where possible, to obtain the plants in season, from the seedsman or florist.

Among the hardy annuals that can be readily grown from seeds are asters, ageratum, alyssum, coreopsis, calendula, candytuft, cosmos, lobelia, mignonette, marigold, nicotiana, pansies, nasturtiums, phlox drummondii, petunias, pinks, salvia, stocks, salpiglossis, sunflowers. Plants of all these can be purchased in season and give more satisfactory results, coming on quickly.

It is best to patronize your local seedsman, who has studied the conditions and requirements of your own section and whose success depends on his painstaking care in listing stocks that are known to be adapted to the soils and climate of his section. For let it be understood that everything will not grow to perfection even in our ideal climate, and we should confine our efforts to those varieties that offer the greatest assurance of success.—Portland Oregonian.

TWO BLADES OF GRASS.

Recently about every one who can spare the time from the illusive race of garnering enough round dollars to meet current expenses has been devoting energy and brain to solving the problem, "Why is it that it costs so much to live?" The Congress grappled with it in very much of a grand stand play—but "High Cost" never batted an eye. The many remedies suggested remind us very much of the countless cures for rheumatism—they work in some cases, but this particular case is different.

Right off the bat salaried people want their wages raised, so that we can pay the increased cost of living. But plainly this would not help the situation ultimately, because if we further increased the cost of manufacture the manufacturer must again raise his prices, and we would be back again to where we started.

A tangible ray of solution has been sprung by Mr. William C. Brown, president of the New York Central Railroad, in a recent issue of The Independent, wherein he suggests that the remedy for the present high cost of living is to get more out of the land. "We have been failing lately in agriculture," says Mr. Brown.

WATERING PLANTS.

Wrong watering.—All plants like to have their leaves sprinkled, but to sprinkle the soil about them as a means of giivng the roots a drink does very little good, and a thorough soaking once a week is infinitely better than a slight daily wetting. When flowers or vines are planted near a house they are in especial danger of suffering from lack of water and should have much more than in other situations. Among the plants which are heavy drinkers are dahlias, heliotrope, forget-me-nots, Japanese iris. Nasturtiums and poppies, both will starve and go thirsty contentedly, only blooming the better.—Harper's Bazar.

Do nothing in an aimless or haphazard manner. No matter how small our grounds or simple our plans, we should always work with the understanding of what we expect to accomplish. Good seeds and plants are not expensive, and only named varieties should be grown, and these marked so that we may profit by our experience.

Nearly every honey producing section of the southern part of the state reports almost total failure of the crop.

Protection of Citrus Fruits.

Fruit growers, especially citrus producers, have felt much concern over the remark of Senator Cummins of Iowa in which he expressed himself in favor of a new tariff which he has declared will be the nearest to free trade this country has ever had. He particularly referred to woolens and citrus fruits as subjects for reduction. How correctly Senator Cummins is reported we have no information, but on this question California fruit growers should be alert. The California Fruit Growers Exchange through its manager, Mr. B. A. Woodford, has sent warning to the members of the exchange, and we doubt not this active body will take a hand in any revision which may come within the next few years, but on the basis claimed by even the most progressive of the insurgents we cannot see where a reduction in tariff on citrus fruits could be secured. The claim has been made regarding the Payne-Aldrich tariff that it did not arrange its schedule on the basis of difference in cost of production here and in foreign countries, but if that basis is adopted in future bills there can be no cause for apprehension on the part of citrus growers. Unfortunately the effort of the railroads to take advantage of the increase in the lemon tariff has embarrassed the situation, but if citrus growers continue to make a strong fight, as they have in the past, we believe the present tariff, which is necessary to the best interests of the citrus growers, will prevail.

Good Roads.

But little has been said recently of the eighteen million dollar bond issue which will come before the people at the next election. Presumably the effort to carry it through has been dropped, for its promoters must see the hopelessness of the situation. Especially is this the case since the meeting of the California Good Roads Association which unqualifiedly condemned the move At that time it was shown that through a juggling of the wording of the bill San Francisco county is exempt from interest on the entire issue. As dealers in that city would largely benefit by the issue of the bonds this has been deemed such a rank injustice that voters in other counties will doubtless vote to a man against it. The interest during the fifty years the bonds are to run would amount to more than the bonds themselves. In addition to this there are many other unfortunate features of the bill which should cause those who are looking to best interest of good roads to vote and work against it. The Cultivator is in favor of good roads, and we know our readers will do everything in their power to advance that cause in this state, but the carrying through of this measure would be a mistake.

More Black Scale.

Inspectors and others who have made close examination of the orange groves report a greater prevalence of black scale this year than for sometime. On the other hand the activity of the scutellista, and in some sections of the rhizobius, in destroying scale is very marked. The progressive orchardist who is determined to have clean fruit the coming season is planning for a vigorous campaign with fumigation or spraying, though fumigation is more generally preferred. This is declared to be an excellent season to make a killing of the pest for the reason that the broods have hatched more nearly at one time and earlier than usual. While orchardists have heretofore preferred to begin treatment after the middle of September, this year many have already begun and are securing excellent results.

A Fifty Million Dollar Show.

San Francisco is talking large these days on the subject of the Panama-Pacific Exposition. While New Orleans was struggling to raise its first million and barely succeeding in that, and is now falling back on the state to bond itself to make up the seven millions required by Congress, San Francisco called a meeting and in two hours raised four million dollars. By this time she has seven and a half millions and says "ten million dollars more will be secured at the special session of the legislature called by the Governor for this purpose." She boasts that this will mean the greatest exposition the world has ever seen. San Francisco astonished the world in her power to recover from an awful disaster and there is no reason now why she should not be equally as resourceful in this great work and honor the state and the nation by her effort.

To raise the productivity of our soil 50 per cent would be an increase greater in value than the entire volume of our foreign trade.

Be Patient.

Farmers sometimes look with impatience at the time necessary to accomplish results on scientific investigations. When the scientist takes up the study of a disease or trouble which is confronting the producing class, it would be most desirable if the next day or very soon the answer could be handed back and the entire matter controlled. There have occasionally been cases of this kind which were almost miraculous. In fact, the citrus growers look at the work of G. Harold Powell in giving information as to causes of citrus decay as an example of the kind of results they would always like to secure. There are other cases like that of the Anaheim disease of grapevines which now after a score of years of investigation still baffles scientists. Many deciduous growers are hoping that the investigations of pear thrips will lead to something explicit and if possible, immediate, but this likewise is another case which will take time and intelligent cooperation on the part of the producers to solve. It may be conceded that investigators do not always do all that they should, but there is nothing gained by discrediting their work, and if the Department is willing to put the men into the field, let us assist them by every possible means and await developments.

Spreading.

California is not alone in its desire to unite its fruit growers in co-operative marketing ventures. We are favored with an Eastern exchange which has extended account of a movement by fruit growers of the famous Shenandoah Valley. This is the beautiful valley which was devastated during the Civil War and afterwards came back to its former beauty and a part of its prosperity. Now it desires more of the latter, and to that end has organized the Shenandoah Valley Fruit Growers' Association, Incorporated, which proposes to market its own crops. Success to the new organization.

U. S. Live Stock Sanitary Association.

The annual meeting of the U. S. Live Stock Sanitary Association will be held in Chicago December 5, 6, and 7, 1910. This organization is largely composed of federal and state officials all interested in live stock sanitary work, but it is not an official organization, being a voluntary association for the purpose of securing more effective carrying out of the interests of live stock people. Special attention will be given at the coming meeting to the consideration of bovine tuberculosis.

Orange Way.

Referring to the "Apple Way" proposed by fruit growers in the State of Washington, which is to be in the nature of a state boulevard lined for its entire length with apple trees, the Florida Fruit and Produce News suggests that a similar feature for Florida, excepting that it be an Orange Way, would be a valuable advertising asset.

The State Board of Health makes the statement that typhoid fever is being reduced in this state so that last year there were 2000 less cases of typhoid than in 1906. This means that there were approximately 200 less deaths. The board also figures out that the average cost of sickness from typhoid fever is $300, and that the state is consequently $60,000 ahead because of the efforts at reduction of this dread disease. More and more our communities are realizing the profitableness of sanitation in its results on good health.

"Two hundred and fifty million dollars a year are wasted on bad roads in the United States. Added to loss on haul the storage and extra food rates make the total expense one billion dollars a year. This means a tax of $12.50 on every man, woman, and child in the country. Corners in the grain markets are frequently the direct result of bad roads. In four bad-roads states three hundred and seventy-five thousand people out of seven million cannot read or write; in four good-road states out of six million population there are twenty thousand illiterates."

Agricultural News Notes of the Pacific Coast

Northern California

Knight's Valley, Sonoma county, is finishing hay baling operations.

Yolo county people will hold an agricultural fair at Woodland this fall.

Dry yards working upon pears in Santa Rosa are finishing the season's work.

Raisin buyers in Yolo county have been busy offering four cents for bleached Sultanas.

Sonoma Gravenstein apple producers report slightly less returns than on last year's crop.

Levee District No. 2, Sutter county, is preparing specifications for raising and improving its levees.

Healdsburg proposes to observe a Harvest Festival in celebration of ingathering time of Sonoma county.

Farmers of Napa county are petitioning the supervisors to raise the ounty of $10.00 on coyote scalps to $25.00.

Santa Rosa Grange is urging the change in date of the annual session of the State Grange from October to December.

The proposition of deepening Sui un Slough at a cost of $3000 is be ng discussed by the Board of Trade f Suisun.

An expert of the Department of griculture, is in Sonoma county to nvestigate the ravages of hops by ed spider.

The management of the State Fair eports a more lively interest on the art of exhibitors than in any pre eding fair.

Vacaville, Solano county, reports he shipping of approximately 800 ars of fruit, or about 100 more than ast year at this date.

The beginnings of what is said to e the greatest irrigation project on e Pacific Coast are evident in Lake, olo and Solano counties.

The Western Pacific depot at Oro lle has received from the Chamber Commerce an exhibit of fruits and ner Butte county products.

A mass meeting is in session in ebastopol today to discuss the mat r of incorporating the Sebastopol ravenstein Apple Association.

Sonoma county hop pickers have und that extra care in picking so as have hops as clean as possible has ded materially to quoted prices.

One commission firm in San Fran sco offered the management of the bastopol-Gravenstein Apple Show 0,000 for the entire bunch of fruit hibited.

A fruit grower who has inspected une growing conditions in the Biggs d Dredgerville sections of Butte unty reports that the crop will be rger than anticipated.

Sacramento and Yolo county horti ltural inspectors and the fruit owers are uniting in a persistent ht, which it is hoped will be effect , against pear blight.

Humboldt county creameries paid butterfat for the first fifteen days August: Capital, 34½; Libby, Mc ll & Libby, 35¼; Grizzly Bluff, 34; meer, 31½; Swift & Co., 35½.

Central California

Thompson Seedless raisins are commanding 3¼ cents.

Kings county has 12,000 acres of muscat raisin vineyard.

Lindsay shipped 113 cars of green fruits during the last month.

Poplar, Tulare county, had a field fire last week destroying much standing grain.

The Department of Agriculture has two cars for precooling of fruit installed at Lodi.

One of the finest herds of Holsteins in the state is said to be at Porterville, Tulare county.

Raisin buyers are exhibiting anxiety to secure raisins and it is much easier to deal with them.

Peach growers at Kerman have sold peaches to the California Canners Association at $17.50 per ton.

Dry fruit packers are offering to purchase all exhibits of dried fruit made at the Fresno county fair.

Santa Clara Valley expects a visit from Dr. Howard, Chief of the Bureau of Entomology, next month.

A Santa Clara Valley pumpkin grower has raised a sample pumpkin this year which weighs 265 pounds.

The annual State Fruit Growers Convention will be held this year in Stockton sometime early in December.

The packing of dried peaches is practically finished at Wasco. Green grape shipments are now going forward.

Dried fruit buyers at San Jose are manifesting a keener desire for peaches, and from 4¼ to 4½ is freely offered.

Fresh Thompson Seedless shipped from Fresno are topping the market in fresh shipments now, often running to $1500.

One company at Hanford is sending out several cars of dried fruit daily, principally peaches; apricots are practically cleaned up.

County Horticultural Commissioner Morris of Santa Clara county is urging upon orchardists a persistent fight against pear thrips.

A live stock and farming company has been formed at Turlock and the company proposes to stock a large ranch with O. I. C. and Mulefoot hogs.

The grain industry in the Alpaugh section, Tulare county, is a great factor, often as much as eight cars of grain being forwarded daily. Some ranches have reported as much as 40 sacks to the acre.

There is contention between raisin growers and the California Dried Fruit Agency. Payments have not been made as promptly as possible and growers declare contract has been violated and they will not deliver this year's fruit.

Wine makers are offering grape producers in San Joaquin county to contract for their crops for from five to ten years at a price reported as $8.50 per ton. Some claim that independent buyers will make similar contracts for $10.00 per ton.

Southern California

Southern California bean growers met at Oxnard last Saturday.

Beaumont, San Bernardino county, is shipping largely of apples.

A farmers institute was held at Mound, Ventura county, last week.

The Ricland Walnut Association has ordered 8500 sacks for this years' output.

A Santa Barbara walnut grower claims he has a sure cure for walnut blight.

Valencias have shown an unfortunate greenness in nearly all orchards this season.

Mentone, San Bernardino county, is growing beans the pods of which are two feet long.

One rancher at San Jacinto, Riverside county, is harvesting 125 acres of Blackeye beans.

An effort is being made to secure a viticultural experiment station in the Imperial Valley.

Lancaster, Los Angeles county, is arranging for a farmer's institute to be held September 28, 29.

Hemet, Riverside county, claims to have a better honey output than any other section of the state.

A beet sugar manufacturer says that 56 per cent of the sugar used in Southern California is beet sugar.

The directors of the Richland Walnut Association report a crop shortage, approximating 75 per cent of last year's crop.

Redlands proposes to have an orange clearing house through which accounts of growers and shippers may all be audited.

The Rialto Orange Co. has paid growers for the second June pool on Sweets $1.94. The St. Michael pool averaged $1.71.

The California Fruit Growers Exchange has issued a circular giving information as to an effort to reduce tariff on citrus fruits.

Buyers of dried apricots in Ventura last week offered 10⅝ cents. A few growers sold at that. Others are holding for 12 cents a pound.

Imperial Valley irrigators are still working along the line of the formation of an irrigation district to take over the holdings of the C. D. Company.

Settlers on the Yuma Reservation in northeastern Imperial county are discussing the matter of erecting a schoolhouse for which bonds will be issued.

The call for increased work and investigation on the part of the Southern California Pathological Laboratory is greater than ever and some have declared its services invaluable to Southern California.

The bulk of the dried apricot crop of Orange county has passed into the hands of the buyers at 10 cents a pound. A little went for less. Some growers are holding for more, as high as 15 cents. The membership of the Orange County Dried Fruit Association has started on its second hundred. There were about fifteen original signers.

The Coast

Threshing is finished earlier than usual at Dayton, Wash.

The cannery at Toppenish, Washington, started August 20th.

Fruit is supplanting the timber industry at Bristol, Washington.

Hay at Ellensburg, Washington, is commanding $20 to $21 per ton.

The use of cover crops is becoming general in the Hawaiian Islands.

Great Falls, Montana, has sold over two million pounds of wool this season.

A wool grower at Great Falls, Montana, sold his 7000 pound clip at 16¾.

Fruit growers at Green Bluff, Washington, have formed a marketing organization.

There will be over 1200 cars of prunes in the Boise and Payette Valleys in Idaho.

The Yakima peach crop is proving lighter than expected, but more than double that of last year.

A drainage system costing $250,000 is being installed in the reservation near Wapito, Washington.

Government crop reports place Arizona at the head of the list in percentage of normal citrus crop.

Weiser, Idaho, shipped its first car of prunes August 20th. That section will have an output of 20 cars.

River boats to handle the grain output along the Columbia will be put in commission about October 1st.

The little town of Cottonwood, Idaho, has sent out during the last twelve months over 500 cars of cattle.

Every available water power site along the Snake River in Idaho from St. Anthony to Lewiston, has been filed upon.

Park county, Montana, reports exceptional crops on dry farming lands, some ranches reporting wheat yielding 45 to 50 bushels.

Fruit growers at Green Bluff, Washington, have perfected a co-operative organization to have charge of marketing their fruits.

Prune pickers beginning work in one orchard near Walla Walla, Washington, picked seventeen trees which averaged $18 return per tree.

A dry farmer at Dayton, Washington, certifies to a yield of wheat averaging 63 bushels per acre and running 64 pounds to the bushel.

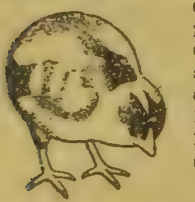
New crop wheat being delivered at Douglas, Washington, nearly all tests as Number 1. There are now stored in the warehouse 287,000 bushels.

The drouth in Eastern Washington which has been the principal cause of the great forest fires has also done fearful damage to nearly all crops.

Arrangements are being made by the state agricultural college at Pullman, Washington, for the largest series of farm demonstration trains and work ever undertaken.

Representative grain growers near Pendelton, Oregon, have formed a district organization and made arrangements to secure grain quotations daily from market centers.

Baby Chicks, Laying Hens, Pullets, Etc.



On hand every day of the year. Free 32-page catalog gives prices, descriptions, etc. We ship to every town in the West. Our prices are lower than any other dealer, as we buy more and sell on less margin of profit. We can fill orders for White and Brown Leghorn hens, 10 months old, Barred Rock, Rhode Island Red and Black Minorcas 10 months old. We have Black Minorca, Rhode Island Red and Buff Orpington pullets 2, 3 and sometimes older. Send today for catalog. State what yo wish—kind, age and quality, and we can name the price.

We can fill orders for Reds and Barred Rock chicks ever Tuesday at present.

Pioneer Hatchery Co., 112 E. 8th, Los Angeles

Coulson's EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying power and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Get it at your dealer's; anyway send for our Catalog which tells about the famous Coulson products and gives valuable information about Poultry Raising.

Profit in the Poultry Yard

SOME MOLTING POINTS.

IT is surprising to an old poultryman to be asked why hens lose most of their feathers soon after midsummer. Yet that is the question coming from a poultry raiser in Missouri. Still this querist is no more ignorant of some common matters than many who pretend to know it all. I recently visited a man who has raised poultry about 15 years, and he told me that he had lost about 20 hens the past month, and he believed the cause of their death was salt. He had seen in a "secrets" book that salt promoted laying, and also prevented early molting, so he had tried it, with the result stated. He will know better hereafter, but without a doubt hundreds have been misled into sustaining the same loss. When I visited him he was mixing some kind of "appetizer" with his poultry food. I asked him what it was composed of and he said he did not know, but it was said to be mighty good for fowls. Did he show any more wisdom than the party asking why hens lost most of their feathers after midsummer?

I notice that there is a good deal of ignorance displayed about the management of fowls when they are molting. Many poultry raisers are fond of declaring that they never have a molting fowl. That they dispose of every hen just as soon as she begins to molt. That is the chatter of the "smart." I have been in the poultry business 30 years, and can prove that I have made more money from plain poultry than any ten "smarts" that ever lived, and I have made a good deal of it from molted hens. In every flock of 50 hens it is possible to find a full dozen or more that are each worth five to ten ordinary pullets. I have had hundreds of hens that up to the end of their second and third business year were high-class money makers, both as layers, incubators and brooders. I have had single hens that made me as high as $20 their second year. They were not fancy stock, but plain, business market stock, and their eggs and the chicks they hatched were sold in the open market. I am well aware that there are plenty of wiseacre poultry raisers standing on one foot to question this statement. But there are lots more who understand the possibilities of a thoroughly well managed hen who are just as ready to accept it without question, because they know there is nothing extraordinary about it.

To carry a hen over in good shape, get her through the molt and at business again of course requires sensible management. If properly fed she will continue to lay all right until most of her feathers are off, but as soon as the new ones begin to grow it is practically a physical impossibility for her to produce eggs, because the very material that enters into the formation of eggs goes to produce feathers, and her system is unable to supply more than what is required for either purpose at one time.

When a hen begins to grow a new outfit of feathers, and ceases to lay, most poultry keepers think it is not worth while to waste any feed on them, and that is right where they miss it badly. Just at the time the hen needs quite as good feeding as when she is laying to enable her to quickly produce her new coat she is about half starved, and the formation of her new plumage is delayed and the molting process is naturally slow and continued into cold weather, often until well on to Christmas. Then, very often she does not begin to lay again until the toplofty prices for fresh eggs have gone glimmering.

In the case of the hen that is supplied with the material required for the manufacture of feathers, she keeps her flesh, strength and vitality unimpaired, and as soon as the coat of feathers is completed she begins to lay, because her system is charged with egg material, and the formation of eggs is a simple change from the formation of feathers. A hen so treated and cared for will, if given a fair show, produce enough eggs to buy herself two or three times over before spring.

But her owner should remember that she should not be loaded down with fat. The food she needs is not such as produces fat, but flesh and bone—a nitrogenous rather than a carbonaceous food, a food that contains a good deal of lime and fills rather than fattens. A small quantity of corn is all right, but bran, middlings, oats and foods of that character should constitute the chief food. I consider the process of forming a new coat of feathers a greater drain upon the vitality of a hen than the process of forming eggs. I have seen hundreds of poor, ragged birds standing shivering in the raw November winds and without a morsel of food in their crops, and their owners were just as keen for dollars as anybody, but they were too stingy to provide their hens with the stuff that makes dollars. Carry your hens through the molt in good shape and they will amply repay you for the food given them. Neglect them or stint them and they will be a dead expense on your hands most of the winter.

Many an amateur has written me that his hens are not laying, though they look fat and fine, and he wants to know what is the matter. Usually he states that he has fed them lots of Thingumbob's egg maker, hen persuader, panacea and other compounds, but is still shy on eggs. Nin times in ten his hens have not full completed the growth of their feathers, and until that is done he will ge no eggs, whether they be hens or pu lets. The aim of the poultry-raise should be to get the crop of feather matured as early as possible; th earlier this is done the earlier the will begin to lay. And once get thei fairly started and it is an easy ma ter to keep them going.

Don't sell off your best hens b cause you have been unable to i duce hens to lay when eggs were good price, but feed and manage the right and you will find them mo profitable than pullets. Now is th time to give them special care. Th better the care the more profitab they will be.—Fred Grundy in Co mercial Poultry.

A horse should fear the whip rath than feel it.

FLIES FOR POULTRY.

The Cultivator recently chronicled the catching and storing of grasshoppers for next season's meat supply for poultry, and now we notice the following in "an exclusive dispatch" in a daily paper sent us by Mr. Geo. H. Ennis of Los Angeles:

"The Ward Line steamer Merida brought here today tne strangest item of cargo that the purser has ever nad upon a manifest. It was a consignment of thirty-eight five-foot bags of dried flies. The flies, many of which are now ground into powder, were shipped by A. G. Vimbert of Santa Cruz to Schroeder & Bros., Hamburg.

BUTTERCUPS ARE AN OLD BREED WITH A NEW NAME.

We quote the following from a writer in the Country Gentleman:

Is the "Buttercup" a new breed? is a question which can be answered with an emphatic No. J. H. Haynes says that Capt. Cephas Dawes brought them to this country in 1877, which would be about a third of a century ago, and, of course, they had to be in existence in Sicily some time previous to that date. The breed probably has existed half a century, perhaps much longer than that.

For some years back a certain Massachusetts breeder has been advertising Buttercups. Long before this breeder's advertisement appeared, the writer bred, advertised and sold the capcombed Sicilian fowl as Sicilians. And years before that, in the columns of the Poultry World, then published by H. H. Stoddard at Hartford, Conn., descriptions of the fowl appeared. That the Buttercup is the same fowl as that bred by the writer, and earlier described in the Poultry World, is obvious from the similarity of the description given by Mr. Haynes with that of the fowl kept by this writer, and that which appeared in the aforesaid poultry journal, as well as from the fact that the Massachusetts breeder referred to advertised his fowls, at least in his earlier advertisements, as "Buttercups or Sicilians." I find that the hens were excellent layers of medium-sized eggs; that in figure and shape they reminded one of both the Leghorn and the Game, not being, perhaps, midway between the two, but still possessing a likeness to or suggestion of both breeds; that the hens are not what I should call fawn, but rather buff, in color, with black and irregular markings; that their principal peculiarity was the character of the comb, nearly round, hollowed out in the center, and forming a cup or crown. If one will take a rose-comb, remove the spike, and dig out the center, one will get a fairly good idea of this comb.

I have had White Leghorn pullets lay when 14 weeks old, and I have never known Sicilians or Buttercups to lay at an earlier age. Such early laying, in any breed, is exceptional and does not fairly indicate the average laying age. Like the Leghorns, too, the Sicilians were fairly prolific layers, but I never knew a Leghorn or Sicilian to lay 300 eggs in one year. I do not deny its possibility, but I always feel when I read of such records that there must be a mistake somewhere. There are so many opportunites for mistakes to occur that such a record as this needs to be strongly fortified by proofs. It really seems to me that I couldn't believe it, if I had told it myself; I certainly couldn't unless I knew all the circumstances, and knew, also, that every chance for mistake had been eliminated.

But if it is the fact, if a Sicilian or Buttercup hen has really laid 300 eggs in one year, we must not forget that it is the record of an individual, but not of the breed. My father once owned a gray gelding that could trot a mile pretty near to 2:30, and so he bought another colt from the same sire and dam, but the second one could not trot a mile in four minutes. The statement of phenomenal performances of individual hens, without any qualifications, is apt to be misleading . If a Buttercup hen has laid 300 eggs in a year, it does not follow that the breed is exceptionally prolific, though I have no doubt, unless it has fallen away in this respect from its former state, that it is a good-laying breed. As a layer it will compare favorably with the Leghorn; at least those I owned did.

To sum up the whole matter, the Sicilian or Buttercup is a smallish fowl, with a cup comb, in appearance reminding one of the Leghorn and the Pit Game, with the markings of the female somewhat irregular, of a maturity and prolificacy similar to those of the Leghorn and with similar faults. It is not, in my opinion, likely to revolutionize poultry keeping or egg-farming, nor to displace other heavy-laying breeds, but it nevertheless is a good layer and "for those who like this sort of a thing it is probably the sort of thing they will like."

LIME.

The lime which goes into the shells of the eggs will not be lacking if the food is varied, as nearly all foods contain lime in some form. Experiments in that direction show that the use of oyster shells does not insure a sufficiency of lime, though oyster shells will serve the purpose to a limited extent if the food does not provide the necessary lime. It is claimed that a hen may be confined on a board floor, allowed only flint gravel for the gizzard, fed plenty of green food with a small allowance of grain and meat, kept warm and comfortable in winter having ample opportunity for scratching in litter of some kind, and she will lay perfect eggs with proper shells, without even the least proportion of oyster shells or lime near by her. The lime will be derived from the food, and in a proper condition so as to be easily digested and assimilated and in a state in which it becomes immediately available as a constituent of the egg. There are hens in some sections that are far from the sources of supply of oyster shells, yet they equal those in other localities as egg producers. Nature prompts the fowls to select the food best adapted for their purpose, and if given a variety they will balance the suppply so necessary for the production of eggs.—Coleman's Rural World.

DESTROYING VERMIN.

A subscriber wants to know how to get rid of lice, mites, etc., in his hen house. This can be easily done if the building is tight, so that by closing doors and windows all fresh air may be excluded and then fumigate with sulphur. If the floor is of wood, place stones or bricks in the middle and on them put a pot in which are live coals, and when all is ready, throw on the coals a pound or two of sulphur and leave the building at once before breathing the fumes. Do this early in the morning as soon as possible after hens are off the roost, and leave the hen house closed till four o'clock, then open and let air before the fowls go on roost. Lice, mites and bedbugs will be dead.—Rural World.

POULTRY MANURE.

It is believed that the following brief summary of information on the preservation and value of poultry manure prepared by F. W. Morse, of the New Hampshire Station, will be of general interest:

As is well known, when the poultry droppings accumulate under the roosts and when they are left in barrels there is a strong odor of ammonia noticeable. The development of such an odor is a sure sign that gaseous ammonia is escaping into the air to be lost for the present. How to prevent such a loss is to prevent the development of the odor. Several chemicals of more or less fertilizing value in themselves may be added to the droppings from time to time with good effect, both in stopping waste and in making the atmosphere of the henhouse more wholesome.

The best materials for this purpose are gypsum or land plaster, acid phosphate, and kainit, a cheap potash salt. Each of these chemicals has the power of forming new compounds with the ammonia as fast as it is set free from the original combination. Wood ashes and slaked lime should never be used, because they can not combine with ammonia while they do force it out of its compounds and take its place.

Plaster is apt to produce a dry, lumpy mixture when used in large enough quantities to arrest the ammonia, while kainit and acid phosphate produce the opposite effect of a moist, sticky mass.

In Bulletin 98 of the Maine Experiment Station is described an experiment in which sawdust was used in addition to the chemicals. By this addition of an absorbent, the kainit and acid phosphate could then be used with excellent results.

Using their results as a basis for calculation, the weekly droppings of a flock of 25 hens, when scraped from the roosting platforms, should be mixed with about 8 pounds of kainit or acid phosphate and a half peck of sawdust. If one desires a balanced fertilizer for corn and other hoed crops, a mixture of equal parts of kainit and acid phosphate could be used instead of either alone.

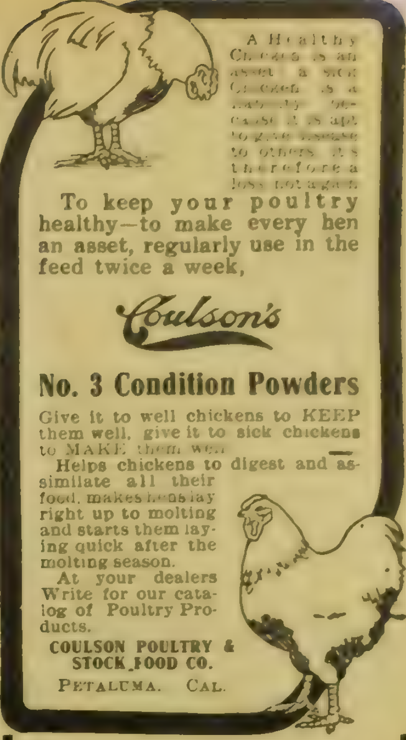
Good dry meadow muck, or peat, would be equally as good as sawdust, if not better, to use as an absorbent.

In the experiment mentioned more than half of the ammonia was lost in hen manure without chemicals, when compared with that which had been mixed with them.

Fresh poultry manure at the present values of fertilizers would be worth 60 cents per hundred pounds. Figures from different experiment stations would give the product of 25 hens for the winter season of six months as 375 pounds from the roost droppings only.

Poultry manure is especially adapted as a top dressing for grass because of its high content of nitrogen in the form of ammonia compounds, which are nearly as quick in their effect as nitrate of soda. A ton of the manure preserved with sawdust and chemicals would be sufficient for an acre, when compared with a chemical formula for top dressing.

On the same basis of comparison, 100 fowls running at large on an acre should in a summer season of six months have added to its fertility the equivalent of at least 200 pounds of sulphate ammonia, 100 pounds of high grade acid phosphate, and 60 pounds of kainit.



A Healthy Chicken is an asset, a sick Chicken is a liability because it is apt to give disease to others, it is therefore a loss not a gain

To keep your poultry healthy—to make every hen an asset, regularly use in the feed twice a week,

Coulson's

No. 3 Condition Powders

Give it to well chickens to KEEP them well, give it to sick chickens to MAKE them well.

Helps chickens to digest and assimilate all their food, makes hens lay right up to molting and starts them laying quick after the molting season.

CAN YOU SAW AND HAMMER?

If you can, you can fit out your poultry house with 1910 conveniences. Other poultry keepers who work at their regular trade or business make hoppers, ordinary and trap nests, fireless brooders, fresh-air doors and windows, portable fences, and even fresh-air and portable houses, during their spare time, and you can do the same. Probably you have never been told how these conveniences can be built—everyone doesn't know these things—but you now have an opportunity to learn from the builders themselves.

Simple descriptions and 146 illustrations of everything the builders have found "just what the doctor ordered" are contained in a new book **Built and Used by Poultrymen.** This is the only book that tells you how to make these things just as though you were talking face to face with the builders themselves. Mr. Jensen tells you how he built two kinds of fireless brooders (one is shown above), and so on through the *fifteen chapters.* Read their titles and see the large number of subjects treated.

Modern Breeding Houses. Modern Colony Houses. Modern Brooder Houses. Houses for Indoor Brooders. Houses for Males and Small Pens. Adapting Barns for Poultry. Movable Fences and Fencing. Nests and Trap Nests. Brood Coops, Runs and Pens. Modern Fireless Brooders. Hot-Air Brooders. Shipping Day-Old Chicks and Eggs for Hatching. Food Hoppers and Fountains. Methods of Sprouting Oats. Other Useful Devices.

This valuable 100-page book, bound in a handsome colored cover and filled with helpful reading matter and 146 clear illustrations, will be mailed to you for **one-half** the publishers price, if you accept **our Special Offer.** Act promptly and profit by these new ideas.

California Farm Names

FARM NAMES.

COVERING a period of several months, a year or more ago, the Cultivator ran several lists of farm names adopted by people all over the State of California. Occasionally now there comes to this office inquiry as to these lists and as to possibility of securing exclusive right to a name in this state. The last legislature passed a law governing trademarks in which the privilege was extended to cover trademarks of names of farms, orchards or packing houses. This law requires payment of a fee of $5.00 in order to secure exclusive right to use of name for any ranch in the state. Anyone wishing to secure this exclusive privilege should write the Secretary of State for blanks and information.

We give below list of names formerly appearing in the Cultivator. There are two in this list which are duplicates, but widely separated as to location. Excepting for that one case, we believe there is no duplication, though other names come remarkably close to each other, for example, "Highland Farm" and "Highland Home." Where the name is not trademarked, it is a safer proposition to coin a word, as will be seen in some cases in the list given. To do this requires some skill to secure a euphonious and pleasing name as well as one appropriate to the ranch.

Should this naming of the farm appeal to others, we would appreciate it if the name be sent in spelled plainly, together with any facts which may be of interest to our readers. Please note that we say "spelled plainly" because in the ordinary running hand a name is easily mistaken. For example in the old list appeared the name "Soywild." This was plainly a mistake though no stranger than some other names chosen. The name should have been written "Ivywild." Therefore, in order to indicate to newcomers who may wish to have names published, we use this one instance to point out the difficulty mentioned.

The following are farm names which have been sent in for publication since the former lists appeared.

Ivywild. Owners, Mr. and Mrs. M. B. Olds and Miss Ella Dillon, Ceres, Stanislaus county. "We have lately purchased this farm of 20 acres. It is three miles east of Ceres and one and a half miles southwest of Hughson. It is under the Turlock Irrigation Ditch. It has 12 acres of alfalfa, also grapes, fig trees, family orchard of all kinds of fruits, grounds about the house supplied with shade and ornamental trees, and a very comfortable six-room house. We are greatly pleased with our new home."

Golden State Ranch. Owner, C. H. Carlson, Hughson, Stanislaus county.

Rancho Mirasol. Owner Carl C. Curtis, Pasadena, Los Angeles, county. This is a beautiful little ranch given over largely to production of white leghorn poultry. It is next to the Sierra Madre foothills, with beautiful view and one of the neatest little bungalows we have ever seen.

Earl Poultry and Fruit Farm. Owner, G. W. Earl, Gilroy, Santa Clara county.

Umbra Oak. Owner, C. V. Wickham, Pasadena, Los Angeles county.

Valley View. Owners, Pickering Company. Manager, L. A. Pickering, Whittier, Los Angeles county.

Morningside. Owner, J. E. Dunn, Gardena, Los Angeles county. There are 80 acres in this valuable ranch which is near the city limits of Los Angeles in the rich alfalfa section of Gardena, and is an exceptionally valuable property.

Orion Place. Owners, Mr. and Mrs. Bird Thomas, San Gabriel, Los Angeles county. This cosy ranch home is fifteen miles from the city of Los Angeles just off the Duarte Road on the great Baldwin Ranch. From the place is a wonderful view of mountain and valley, and it is indeed an ideal home spot. There are ten acres planted to fruits. The name is taken from Mr. Thomas' given name, and also means star or constellation of stars. Mrs. Thomas writes, "We hope to make it a star place soon."

Florence Villa. Owner, G. D. Tofanelli. Mr. Tofanelli writes: "The name of the ranch is Florence Villa. I came from that city and my business is making olive oil and pickled olives. You know that Florence is the capital of Tuscany, Italy, where the olive trees, and in consequence the olive oil, are the best known in the world, so that I wish to give to my ranch the same name because I manufacture fine olive oil the same as that of Florence, Italy."

Star Wano Ranch. Owner George M. Needham, Rumsey, Yolo county. Mr. Needham writes that his ranch consists of 20 acres on which he has 1200 trees consisting of almonds, peaches, apricots, pears and oranges, also some hay land, pasture and a garden, all of which are irrigated from well belonging to Mr. Needham. The water is raised by a gasoline engine, and stored in round cement tank.

Names formerly published in the Cultivator are given below:

Farm Names.

Acacia Farm, C. B. Marks, Dos Palos.

Alberta Orange Grove, A. E. Rudell, Rialto.

Alfadena, L. E. Dahling, Yuba City.

Alpha Dune Ranch, J. J. Smith, Brooks.

Alta Vista Ranch, L. F. Sternman, Wrights.

Anchorage, Capt. and Mrs. Oscar Kustel, Ontario.

Arbor Ville Ranch, W. H. Condart, Holtville.

Argyle Orchard and Farm, Robert Adams, Beaumont.

Bellflower Ranch, Mr. and Mrs. E. G. Nelson, Chino.

Belle View Ranch, M. C. Kelly, San Dimas.

Black Mountain Ranch, Warriner and Son, La Mesa.

Calazona Ranch, F. S. Webster, El Centro.

Canyada Verde, A. M. Otis, Whittier

Carson Heights, Mr. and Mrs. Fred E. Judson, San Pasqual.

Central Grapery, J. L. Winniger, Compton.

Cypress Avenue Fruit Vale, Mr. and Mrs. D. S. Conyer, Los Alamos.

Deveron Grove, E. S. Ingram, Pomona.

Dogwood Ranch, Arthur S. Fell, El Centro.

Dos Alisos, G. S. Storrs, Duarte.

Dunwoodie, James Scott, Los Banos

Early Vale Orchard, H. Kettenburg, Winters.

Edgeland Acres, Edgar S. Miller, Elk Grove.

El Alamo, C. H. Francis, Loomis.

El Guernsey Rancho, E. G. Webb, Fresno.

El Modello, Charles F. Collins, Dinuba.

El Verde, Mr. and Mrs. Fred J. Smith, Pomona.

Enterprise Jersey Farm and Nurseries, Tribble Brothers, Elk Grove.

Far View Berry Ranch, J. S. Bates, Highland.

Forest Oaks Ranch, A. E. Bennett, Tustin.

Glendell Grove, Monroe Miller, Lakeside.

Green Mountain Farm, G. S. Trauzettel, Ukiah.

Greenwood Ranch, C. E. Garrett, Hynes.

Hazlecroft, Mr. and Mrs. H. J. Painter, Glendora.

Palma Vista, John A. Whetstone, Escondido.

Palmetto Orange Ranch, Mr. and Mrs. C. R. Rice, Lindsay.

Palomitas Vineyard, Mr. and Mrs. W. N. Sherman, Fresno.

Paulheim Ranch, E. V. D. Paul, Ukiah.

Paradise Ranch, C. H. Carlson, Hughson.

Paramont Ranch, J. H. Miller and Sons, Ritchey.

Quail Hollow, William Richards, Eddles.

Rancho de la Rosa, Mr. and Mrs. C. A. Rose, Le Grande.

Rancho de Martinez, Thomas R. Hanna, Martinez.

Rancho Kielyenso, Wm. Kiely, Lawrence.

Rancho Santo Antonio, A. J. A. Frietas, Hanford.

Rosehill Bee Farm, August Soderquist, Turlock.

Roselawn, John F. Digmun, Norwalk.

Shady Oaks,. S. D. Phillips, Bachelor.

Entrance to a Porterville Orange Grove.

Highland Farm, H. R. Ives, El Cajon Valley.

Highland Home, John Carlson, Selma.

Home Orchards, Frank Femmons, Ahwahnee.

Indian Hillock, J. T. Law, Loomis.

Kanova Ranch, Mrs. P. J. O'Mealey, Miss Bee Josephine O'Mealey, Mr. J. S. C. Richardson, Anderson.

Keystone Ranch, Dr. and Mrs. W. N. Sherman, Fresno.

Kiwelattah Farm, David Wood, Arcata.

Lemora, L. G. Joslin, Chula Vista.

Linda Vista, J. W. Mills, Marysville.

Lindoford, Mr. and Mrs. N. Woodford, Chico.

Locust Farm, H. P. Brown, Bakersfield.

Loma de Luz Orchard, O. M. Prickett, Alma.

Maygrove Ranch, A. T. Kenyon, Charter Oak.

Medawin Ranch, E. W. Blakeman, Holtville.

Merlin Villa, Mrs. J. Lenert, Chino.

Minnetonka, Chauncey S. Sheldon, Lordsburg.

Minnewawa Vineyard, Dr. and Mrs. W. N. Sherman, Fresno.

Mistletoe Ranch, B. Howard Whitcomb, Holtville.

Moen Ranch, E. O. Eggin, Hemet.

Mountain View Ranch, Roy E. Swigart, Macdoel.

Myrtlehurst, Mrs. Alfred J. McClatchie, Montebello.

Muscatel Orchard, Mrs. J. B. Leininger, Fresno.

Nuthurst, J. F. Unruh, El Monte.

Orange Crest Ranch, Mr. and Mrs. F. A. Thornton, Camanche.

Shasta View, J. H. Walker, Olinda.

Spring Vale, Frank Tunnell, Los Olivos.

Steladelma, G. W. Scott, Madison.

Sunnyside Ranch, P. N. Warner, Sanger.

Tanglewood Farm, Mr. and Mrs. J. H. Goodier, Corning.

Tereticornis Rancho, Rev. L. D. Temple, Hemet.

Teson Rancho, A. S. Bradford, Placentia.

The Four Waters, Captain H. Anlauf, Santa Paula.

The Gables, Frank Mead, Sutterville Heights.

The Louisiana, F. A. Louis, Lankershim.

The Love Ranch, D. C. Love, Fillmore.

The Nutshell, Mrs. Mary A. Powell, Elk Grove.

The Oaks, C. E. Moore, Yuba City.

The Oaks, F. M. Leasure, Tulare county.

The Orange Hague, P. Ting, Plano.

The Poplars, D. D. Palmer, Modesto.

The Swastika Ranch, H. C. Porter, Alpaugh.

The Virginia, Joseph Clarke, Redlands.

Villa Alois, A. Podrasnik, Uplands.

Vineclad Farm, Geo. D. Lee, Compton.

Vista Grande, C. Le Roy Kennedy, Mountain View.

White Cliff Fruit and Vegetable Farm, W. A. Mayo, Ventura.

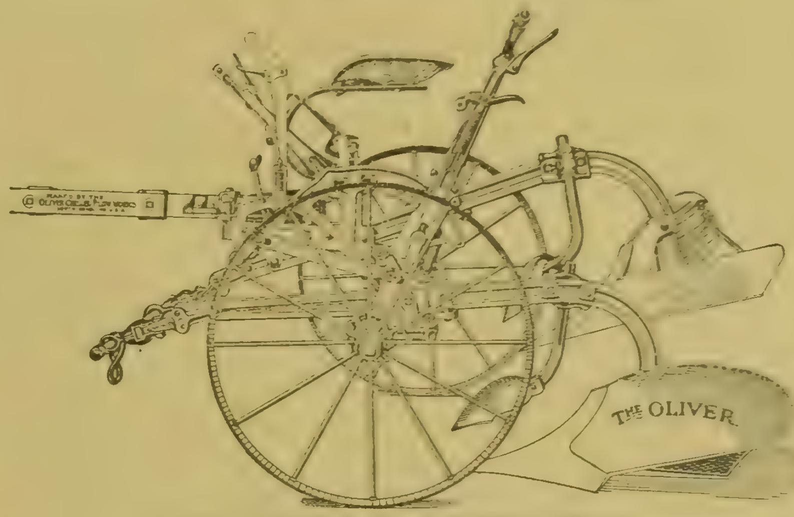
Wildoe-Astoria Villa, J. K. Wilson and G. Thornton Doelle, Nestor.

Willow Dairy, S. S. Farnsworth, Tulare.

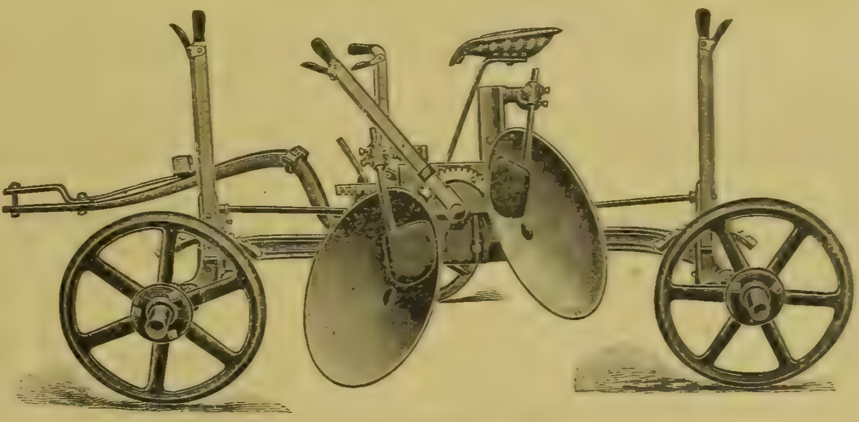
Woodside Ranch, H. D. Williamson, Santee.

Reversible Plows
For Plowing Side Hills and Level Land

No. 508-Oliver Walking Plow



No. 23-Oliver Sulky Plow



Sunshine Disc Plow

Our Plows are guaranteed to plow perfectly and leave the land without water furrows. Send for full description and prices.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Pickling Olives.

Please give formula for pickling olives.—M. F., Orland.

The Cultivator now has in manuscript ready for the paper an excellent article on olive curing written by Mrs. Minna E. Sherman. This will appear in the Cultivator in the next two or three weeks in abundant time for this season's pickling.

Renewing Alfalfa.

Can I thicken a new seeding of alfalfa which has pig-weed and tumble-weeds in it, and when would be best time to sow? Is it wise to disk oats in a late stand of alfalfa the last of November? Would it injure the alfalfa? If not, how many bushels of oats should I sow to the acre?—P. R. J., Pomona.

The new seeding of alfalfa we would give a thorough disking well towards spring, seeding also with clean alfalfa seed. The disking will aid in the stooling out of the roots now in ground, providing the disks are set so as to cut very straight. We would not put oats in on the later sown alfalfa, but treat that in the same way, that is, disking and seeding with clean alfalfa seed. In your section, especially if the land is not irrigated, it might be wise to do this in November rather than wait until spring. As to sowing with oats, we believe the benefit would be more than overcome by the loss, but should you wish to do so, you can sow say, two bushels of seed to the acre.

Bees in Tank House.

How can I get rid of bees that have been in tank house for more than a year? Have tried to kill them with poisoned honey; have smoked them with sulphur smoke, but they still remain; have filled up all holes and they still get in.—A. B., Redlands.

This is quite a question and one for which there is no explict answer. If any of our subscribers have had experience and have succeeded, we will appreciate suggestions. The subscriber says that he has stopped all the holes, and it seems that would be sufficient. We have heard of similar cases where crude black oil was used, being smeared over the entrance, but in this case we cannot see that this would succeed.

Yellowing Oranges.

I note that Valencia growers sometimes sweat their oranges to secure return of orange color. Mine have turned green. How can I secure more desirable color?—Subscriber, Oroville.

The oldest and probably the simplest method is to put the oranges in a heap, turn the hose on and thoroughly wet the whole pile, then cover with heavy canvas and leave for a couple of weeks. This is also the most satisfactory way if time is not a factor. The natural heat generated colors them and the stems do not drop out as is the case with artificial sweating. Artificially they are colored more quickly by placing in a tight room and raising the temperature by use of oil or gasoline stoves over which cans of water are placed. By this means the room is quickly raised to a temperature of, say, 95 degrees, and held there for a few days when the color will be satisfactory, but, as noted, many of the stems will drop out, causing a lowering of grade of fruit.

Storing Sweet Potatoes.

Will sweet potatoes packed in sawdust or shavings keep over winter? Would they influence flavor of the potatoes?—Robert Werner, Loma Linda.

Any method which will keep your potatoes at a uniformly cool temperature and dry is good. Some leave in the ground, when it is a dry, sandy soil, until needed. We would prefer use of dry sand to shavings or sawdust. They probably would contain more moisture and be more inclined to heat than would sand. In any case we would not dare to use shavings of a piney or pitchy nature because of possible effect on flavor of potatoes. Of course cold storage is best. If the idea is to store for better prices we believe we would prefer marketing at once for the loss is usually large.

Cover Crop.

What is the best cover crop to plant in young Muir peach orchard? Do you consider cover crop as good a fertilizer as sheep manure?—Subscriber, Porterville.

The best information on cover crops to which we can refer you is the issue of the Cultivator of September 9, 1909, but in a word, the best leguminous crop which will give the greatest tonnage in your section is the one to use. Vetch is generally favored in the orange orchards, but in your section if burr clover will give a much heavier crop we would choose that. No cover crop will give as good or as quick results as will sheep manure; cost is the factor which decides in favor of cover crops. The manure would carry not only nitrogen, but potash and phosphoric acid into the soil, while the cover crop, except as it appropriates the nitrogen of the soil air, only makes available what is in the soil, and improves its mechanical condition.

Paspalum Grass.

Is anyone in California growing Paspalum dilatatum, and with what success? Also is Arabian alfalfa successful in this climate, and is it preferred to the Chilean?—Subscriber, Tipton.

Paspalum has been tested at the experiment grounds at Berkeley and we think also at the grounds at Tulare. By writing the director of the state experiment grounds at Berkeley you can secure definite information. In a general way we may say that it has not proven of exceptional worth here; in Australia and under moist conditions it has proven remarkably profitable.

Arabian alfalfa has been tested too short a time to show its permanent value. It makes a very high grade of hay; its growth is exceedingly rapid and many claim it gives an extra cutting, or even more, per year over the Chilean. The same bulk of Chilean will weigh heavier than Arabian. Others have found it short-lived and in need of re-seeding after two or three years.

Soap Without Boiling.

Please give me recipe for makin soap without boiling.—Mrs. H., Waukena.

We are unable to find such a recipe and ask help from subscribers.

Nitroculture.

Please give information regarding inoculating seed with nitrocultures. Also how is seed treated with blue stone to prevent rust or smut? Wheat and oats are so treated in Canada.—L. E. A., Hemet.

See article on page 187 of the Cultivator of August 5th, 1909, also on page 402 of issue of October 21st 1909. In a word we may say that the best plan is to secure soil from an alfalfa field already inoculated and growing well. A barrel of soil will be enough for 100 pounds of seed. Have soil slightly moist and mix with seed. A slight sprinkling as the material is shoveled over is advisable. Keep out of strong sunlight, sow and harrow in as quickly as possible. Instructions for use of commercial nitroculture will be found on the package.

For treating wheat and oat seed for rust two dips have been recommended, both almost perfect in their action if care is taken. The oldest is corrosive sublimate 2 ounces and water 15 gallons. The other is formalin, 1 ounce, water 2 gallons. Immerse for 30 minutes. Blue stone is also used.

Silkworm Culture.

Can you give me any information as to silkworm culture? Can it be made profitable in this section? Where may I secure worms for a start?—Subscriber, Lodi.

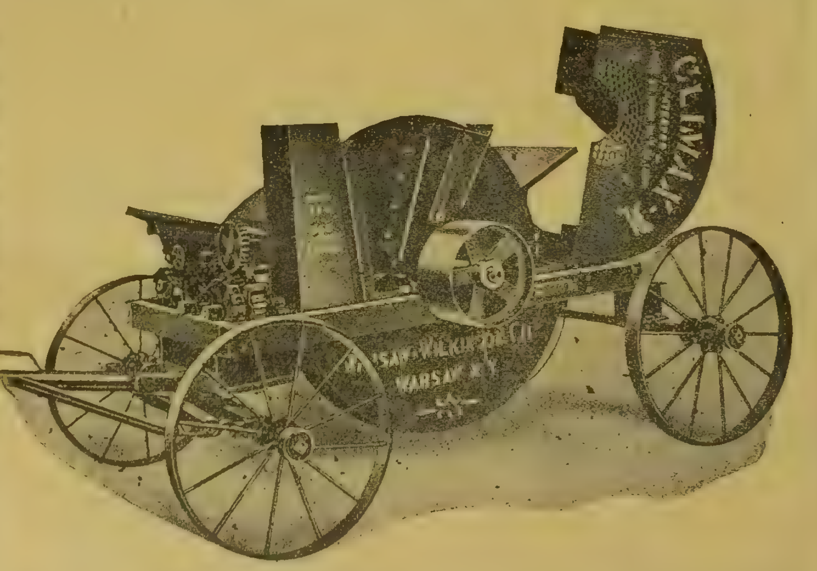
We believe there has been no example of success in sericulture in California, at least on a commercial basis. There have been one or two small plants which as a novelty in tourist towns have proved satisfactory. It has been claimed that as a commercial proposition labor is altogether too high to permit of the success of the industry. The mulberry grows here to perfection and leaves may be had in practically every month of the year so that in theory this seems to be a favorable location. The time may come when there will be a better opening.

FARMER'S CONGRESS.

The thirtieth annual session of the Farmers' National Congress, opens in Lincoln, Neb., October 6. The governor of the state is much interested and will tender a reception to the delegates. Hon. W. J. Bryan will deliver an address. The delegates will visit the Beatrice creamery, the largest in the world, located in Lincoln. George M. Whitaker is secretary, 1404 Harvard street, N. W., Washington, D. C.

R. R. Snowden the soil expert has a change in his advertisement in this issue. Look it up, and write him for terms, etc.

Climax Ensilage Cutters



In the Climax Pneumatic Ensilage Cutter both the cutting and elevating are done by a large wheel which carries the knives on one side and the elevating fans on the other. Both the cutting and elevating, therefore, are done at one operation, in much simpler manner and with an expenditure of much less power than in those machines where the elevating device is a fan attachment added to the cutter.

The convenience of having an ensilage cutter of large capacity on its own road wheels is obvious. We confidently assert that no other ensilage cutter is so easy to work and easy to move and set up as ours, or has such large capacity for power used. They are unequaled in simplicity, strength, durability, convenience and safety in operation, and the excellent quality and uniformity of the silage. We received at the

St. Louis Fair the Only Award

for ensilage cutters of the side-wheel type, 5 to 50 tons of green corn per hour, where cut in one-half lengths, other feed in proportion. For further particulars, call on or address

O. J. Weber Co. 225-227-229 East Sixth Street
Los Angeles, Cal.

Vetch

A few tons of imported German seed remaining in warehouse at Los Angeles, also at Redlands. Will make close price to clean up.

Redlands Fruit Association
Redlands, Cal.

Veterinary

Answers in this column by Dr. R. T. Whittlesey, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Warts.

My horse has a big brown wart on side of his jaw above the corner of his mouth. It first appeared as an ordinary wart but has spread to two inches in diameter.—W. R., Calistoga.

The best way to treat this is to cut it out, a very simple operation. Then treat with a solution of sulphate of copper and water. It should heal in a few weeks. If you cannot have this done, use the following: Mix a little dry arsenic with twice its bulk of flour; scrape the surface of the wart until raw, then rub the mixture into the surface and tie the horse so he can not rub against the stall. It will dry up and in a week or ten days fall out leaving a hole which should be treated with the copper solution. If the first application does not take out all the wart, repeat, but do not forget at any time that you are handling arsenic.—R. T. W.

DR. WHITTLESEY'S VETERINARY REMEDIES.

These are not ordinary mixtures but are from well tried formulas, used in an extensive practice in Southern California for nearly a quarter of a century. Dr. Whittlesey's Sulphur Arsenical Salve for deep fistulous or ordinary chronic, indolent sores such as. "Poll Evil," "Fistulas," "Quitters," "Thrush," "Scratches," "Warts," "Collar Sores" or "Sit-fasts," $1.00 per package postpaid. Printed directions. Dr. Whittlesey's Antiseptic Healing Powder forms a coating over raw surfaces, excludes air, flies and floating germs. Makes a cheap and convenient dressing for the many sores that occur to stock on the ranch. $1 full pound can postpaid.

DR. R. T. WHITTLESEY,
Veterinary Hospital, 714 East Seventh St., Los Angeles, Cal.

OUTPUT OF APPLES.

Dr. Berneike of Santa Ana calls our attention to the estimates of the coming apple crop given in last week's issue by the Secretary of the International Apple Shippers Association. This estimate divides the country up into groups showing a production this year ranging from 15 to 300 per cent of normal crop and of a quality ranging all the way from poor to good. Most of the estimates were, however from 100 to 300 per cent of normal, while the Crop Reporter gives the conditions on July 1st as averaging the country over 49.6 per cent. Last year at same date the Reporter gave the condition as 54.6 per cent; 1908, 57.6; ten year average, 69.9. There is no effort in the quotations from the Shippers' Secretary to give the average the country over, but a glance at the conditions in the various states would lead one to think the apple output this year is excessive. We presume the output in the Pacific Coast states this year will be materially increased over last, but sure it is reports from private sources over the Middle West and in many Eastern sections, indicate almost a complete failure of the crop.

APRICOTS ADVANCE.

The Orange County Dried Fruit Association announces that beginning today—Sept. 1—the minimum price on dried cots of the association will be 11 cents.

"Corrections and improvements in government, as in all things, may not be done at once, but only patiently and gradually, and - - - charitably, explaining and teaching as you go."—Mayor Gaynor.

Money Making Little Liners

In this department we will insert your advertisement under a classified head for 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for our many thousand readers.

MACHINERY.

For Sale—Second-hand windmills, tanks, engines and farm machinery that will do the same work as new at half price. Domestic and irrigating windmills and tanks. 2000-gal. tanks at $18.50 or $20, f. o. b.; 2-H. P. Fairbanks, 4-H. P., 6-H. P. Fairbanks, 9-H. P. Moore, 10-H. P. Lambert, 20-H. P. Fairbanks like new; 25 H. P. engine and mining hoist; 2-H. P. steam boiler and engine, also complete wood sawing outfit, mounted on iron trucks with a 9-H. P. engine, complete for $225. Farm and light express wagons, surrey $35, baler, header; gang, disc, road, riding, and walking plows; weeder, cultivator, feed rack, wagons, tanks, fruit crusher, bone grinder, wheelbarrows, pipe, Fresno and Slip scrapers. Most anything a rancher wants second-hand. Demmitt Co., upstairs, 120 N. Main St., Los Angeles, Cal.

For Sale—Gasoline Engines of all sizes. New Alamos, none better on the market. We also have a good stock of second-hand engines taken in exchange and we guarantee these like new and still save you money. An investigation will pay and convince you. Bailie & Brandt Company, 943 and 945 N. Main St., Los Angeles, Cal.

For Sale—11-H.P. Distillate Engine. Used a short time; priced accordingly. In perfect condition. Our guarantees goes with it. Machinery Exchange, Main and Bruno Sts., Los Angeles, Cal.

TREES.

Fine Large Eureka Lemon and Valencia Orange trees, fine for replanting. Choice lot of fine Washington Navels. Order quickly. They are going. Home 'phone 1731. John R. King, Whittier, Cal.

Fruit Trees—Get our advance prices. Choice 4-inch pot roses, 15c. Our tree specials won't last long. Get wise. Ballou's Nursery, Pasadena, Cal.

Marsh Seedless Grapefruit—600 large trees for sale. E. S. Thacher, Nordhoff, Cal.

For First-Class Valencia and Navel Orange trees and Eureka lemons, see A. G. Snow, Oxnard, Cal.

Wanted—Contracts for citrus trees in large amounts, 10,000 or more. O. E. Hyde, Nurseryman, 72 Mary St., Pasadena, Cal.

HORTICULTURAL PRINTING.

The Kruckeberg Press, 123 South Los Angeles St., Los Angeles, Cal., makes a specialty of Horticultural Printing and Engraving. Cuts and illustrations of all standard, economic and ornamental plants on hand and subject to the use of patrons without cost. Samples and estimates cheerfully furnished. Remember, we design, write, engrave, bind and print; in brief, do the "whole thing," at no additional expense to the customer. Correspondence a pleasure.

POULTRY SHOW DATES.

Sacramento, September 3-10, 1910. Annual Poultry Show held in connection with the State Fair. E. F. Mitchell, Director, Sacramento.

North Yakima, Washington, Sept. 26-Oct. 1, 1910. Washington State Fair. John W. Pace, Secretary, Harry H. Collier, Superintendent.

Stockton, Cal., Nov. 8-12, 1910. First Annual Exhibition of the San Joaquin County Poultry Association. Eugene P. Sabin, Secretary, Stockton.

Aakland, California, Nov. 22-27, 1910. Annual Exhibition of the Alameda County Poultry Association. E. K. Healey, Secretary, Alameda, Cal. tary.

Seattle, Wash., Dec. 5-10, 1910. F. E. Barth, Secretary.

Portland, Oregon, Dec. 5-10, 1910. J. C. Murray, Secretary; M. W. Coates and Harry H. Collier, Judges.

Petaluma, Cal., Dec. 8-11, 1910. Fourth Annual Poultry Show of the Petaluma Poultry Association. H. R. Campbell, Secretary, Petaluma.

Ashcroft, B. C., Dec. 23-31, 1910. W. Maxwell, Secretary; H. H. Collier, Judge.

Tacoma, Wash, January 3-11, 1911. Frank L. White, Secretary, South Tacoma; Miller Purvis, Judge.

San Diego, Jan. 4-5-6-7, 1911. San Diego Pigeon and Pet Stock Club. A P. A. rules. W. C. McDougal, Secre-

Los Angeles, Cal., Jan. 5-11, 1911. Annual of The Poultry Breeders Association of Southern California at Chutes Park. A. H. Memler, Secretary, San Gabriel.

Colfax, Wash., Jan. 10-14, 1911. H. Rosenkranz, Secretary. H. H. Collier, Judge.

Walla Walla, Wash., Jan. 17-21, 1911 H. Dickinson, Secretary; H. H. Collier, Judge.

Jerome, Idaho, January 24-28, 1911. Wm. N. Hardwick, Secretary.

FARM LANDS FOR SALE.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station, climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

The Wonderful ALADDIN Lamp

Wonderful because it produces a luxurious, soft, white light, excelled only by sunlight. Burns ordinary kerosene or coal oil, the cheapest of all illuminating fuels.

Burns *Less Oil* than Any Other Lamp of Equal Candle Power

Aladdin Lamps are most durable in construction—easiest to take care of—simplest in operation. The light is brighter and easier on the eyes than gas or electricity.

Occulists declare the **Aladdin Gives The Best Artificial Light Known.** Users declare it is not only the best light, but the best **Lamp** known. **There is No Equal.** The Aladdin is superior by test and best by comparison. It appeals to those who want superlative excellence for its own sake—appeals to those who consider economy a first essential. **Odorless, noiseless, simple, safe and clean**—*The Ideal Lamp* for the multitude.

Don't be bamboozled by an imitation. There is **only one Aladdin.** Insist on having it. The name is on every burner.

FREE Write us for particulars of "How to secure an Aladdin Lamp FREE." **Agents Wanted** for open territory

B loved thau shalt B, and all else B thine.

—Ward's Scrap Book.

DEACON BRADY'S OXEN.

DACON SILAS BRADY, farmer, living a mile outside of the village of Spoonserville, had been known as a good man for more than 40 years. Then charges were suddenly preferred against him in the church where he had held his deaconship for two decades.

The charges were startling and were made by Widow Turner, who was a neighbor of the deacon's and a member of the same church. On a certain day, at a certain hour, and in a certain field, Deacon Brady had used such profane language as caused the widow to shiver, shake and flee into her house and shut the doors and windows, to keep out his further words.

The churchmen and laymen of the village were at once aroused and public opinion was divided.

It took several explanations to make things look clear, and following the explanations the deacon pleaded guilty to the charges and said he would bear his sentence as best he could.

He had been a widower for two years. For over a year Widow Turner had been on his trail with a lasso ready to throw over his head. He had traded a cow and an old horse for a yoke of oxen, and it was while following the plow after the oxen in a field near the widow's house that the language alleged had been used.

Yes, he had been profane. He had no intention of belittling the occasion by protesting that "O, sugar!" or "Darn it all!" was the extent of his profanity.

He had used words that would have done credit to a lightning rod man with a balky team to drive up hill. He had used them in heat and was sorry for it, but he wouldn't promise not to do so again under the circumstances.

The church committee didn't want to bring Deacon Brady to trial. It was known that the charges were made through spite and jealousy, but they couldn't be passed altogether unnoticed.

The minister had been a farmer's son and driven oxen in his boyhood days, and he remembered that profanity and oxen were very closely connected.

Before proceeding to put the deacon on trial it would be charitable and Christian like to gauge the amount of provocation he had had. The tenets of the church forbade swearing at all, but here was a minister who could recognize the difference between a man swearing while telling a story on the steps of the postoffice or when suddenly and unexpectedly "lifted" by a bumble bee as he crossed a meadow.

A hint was dropped to the committee of three, all deacons, that they should try their hands at the oxen before making a report on the charges.

When Deacon Brady was informed of this his look of anxiety faded into a smile that was hopeful and bland.

The committee was invited out to the farm and Deacon Harper was invited to take the handles of the plow. He had looked the oxen over from head to tail and seen nothing wrong about them. They were sleepy and complacent. They chewed the cud of innocence and contentment. He felt that he could follow that plow around a 100-acre field and never utter a "By hen!"

Alas, for the deacon's trust in them that bear the yoke! He started in with a wide and deep Christian furrow, but it was not yet five rods long when the oxen started off on a run, and he was jumped over stumps, bounced over hummocks and lifted over thistle patches, and finally flung into a blackberry bush with one boot missing and his spine out of plumb.

He got his breath and he murmured. He got some more of it and he sat up and talked. He rolled clear of the bush and then swore. They were intended for swear words, and they were solid all through.

When the other deacons had looked at Deacon Harper in pity and reproach and Deacon Brady had felt a warm glow steal all over him, the oxen were brought back to the furrow and Deacon Smith spat on his hands and took hold of the plow handles.

He thought he knew what ailed those cattle. Deacon Brady had bought them of a man who had wickedness in his heart and was in the habit of surprising them with an oath and a blow of the gad at the same moment.

As they started off the deacon began humming the air of a hymn to secure their confidence. Plowing and humming lasted for 200 feet, and the plower had just looked back for an appreciative word, when the oxen turned the yoke, faced the plow, and next instant Deacon Smith was being run over and mashed into the yielding earth.

All the cuss words that had lain dormant for 30 years suddenly bobbed up and overflowed and floated around on the air. Deacon Spooner, who was third on the committee, groaned and looked horrified, but Deacons Brady and Harper, who had had their experience, smiled and shook hands and almost winked at each other.

Before the third and last trial, which was to be made by Deacon Spooner, the minister arrived from the village and Widow Turner put in an appearance from her house.

She had a right to be present at the trials. If there was to be any profanity it was for her to hear it and judge of its weakness or strength.

She wanted her garden plowed. If she hadn't got into a row with Deacon Brady the matter would have been suggested to him days before. If there was to be any further plowing let it take place in her garden.

The minister and other deacons thought well of the suggestion, but expected Deacon Brady to object to the cheeky proposition. To their surprise he grinned with pleasure. He was exhibiting the true spirit of a good man. The oxen he had sworn at should plow the field of his enemy and make it bring forth four-fold. The oxen and plow were accordingly transferred and duly followed.

Deacon Spooner had had the experience of the others to go by, and when he grasped the plow handles he had dignity in his bearing and a surety of victory in his heart.

He would neither hum the air of "Going Home Tomorrow," nor yet wickedly call out : "Gee-up, there, or I'll break your durned necks!" Easily he would do the trick. A firm hand on the plow and neither too fast nor too slow. An ox was not an ass, to be hit with a fence rail because he pondered and lagged; neither was he an eagle, to be yelled at when he wanted to spread his wings in flight and tear up the earth.

At the back end of the widow's garden were four hives of bees. She knew it and deacon Brady knew it, and the minister and other deacons had only to look to see them there.

All eyes and thoughts were on the oxen, however—all but the eyes and thoughts of Deacon Brady. His were on the hives and the insects floating about by the thousands, as he began to make a slow retreat and grin from ear to ear.

While Deacon Spooner was rolling up his sleeves, moistening the palms of his hands and getting ready to conquer or die, the widow looked around for the man she had charged with profanity and sighed and said:

"The day I heard Deacon Brady swearing at them oxen, and then saw him pounding them with fence rails, I told him that the poor critters was sighing for woman's influence. It's as plain to my mind as the nose on the minister's face. If the ass knoweth his master, why shouldn't the ox know his mistress? I want to give 'em a few pats and a few kind words before they start out this time. I want 'em to feel that some human being cares for them. If any of us was an unloved ox I think we would bust out the same as these do."

The oxen not only stood quiet while being petted, but they had evidently been crying for it. Their meekness and docility would have fooled a sharper man than Deacon Spooner. He let the petting go on for five minutes and then announced that he was ready to prove that driving oxen and taking the name of the Lord in vain did not necessarily go together.

The widow called attention to the wonderful change already worked by woman's influence and then stood back. Never yet did a yoke of oxen move off in more seeming content. For five minutes they switched their tails and humped their backs, and the deacon at the plow-handles had just called out that a Christian man who would hurt the feelings of a faithful and patient ox by swearing at him deserved the censure of all mankind, when there was a bellowing and a flourishing of tails, and away went the beasts of the field.

They rushed the plow against an apple tree and became detached from it. They almost ran down the minister and the widow. They drove Deacon Smith into the currant bushes and Deacon Harper over the hollyhocks, and Deacon Spooner was thrown over the plow to land on his head and feel no further interest in the proceedings.

Whether by accident or design, the oxen made straight for the beehives and upset the whole four of them at one rush. By this time Deacon Brady was far away, sitting on the fence, and that bland smile of his had become cream and peaches.

The others stood with open mouths until it was too late. A honey bee whose castle has been upset can fly 200 feet a second, and he requires only another second to start the pitchfork and buzzsaw business.

There were shouts and yells and gymnastics. Some of the plowers rushed into the house and up into the garret, and some down cellar among the pickled peaches, and the frisky oxen frisked as they never had before, and started for the next county, and arrived there to be taken for half-grown elephants.

It was an hour before Deacon Brady slid off the fence and approached the widow's house. He was met by sighs and groans and lamentations. The bees had used up all their pitchforks and gone back to the overturned hives. The minister was sitting on the kitchen table with a towel around his head and just able to see out of one eye, and the deacon softly approached him and softly said:

"My dear pastor, has something happened?"

"There has," was the reply. "When Deacon Spooner took hold to do his plowing, he forgot to swear at those infernal oxen, and none of us have been stung in less than forty places as the result."

"And the charges, pastor—the widow's charges that I blessed the horns and hoofs and tails of those critters and sent all the crows flying for the swamps?"

"Laid under the table. Brother Brady, and I wish you could get some hot vinegar to rub these swellings with!"—Portland Oregonian.

PRETTY PERSONAL.

In one of the large cities a streetcar collided with a milk-cart and sent can after can of milk splashing into the street. Soon a large crowd gathered. A very short man coming up had to stand on tiptoe to see past a stout woman in front of him.

"Goodness!" he exclaimed. "What an awful waste!"

The stout woman turned round and glared at the little man and said, sternly: "Mind your own business!"—Harper's Magazine.

(When writing please mention this publication.)

"There's very little heat. But try this with an ordinary lamp and see what happens."

LIGHT—NOT HEAT

The Angle Lamp gives less heat than any other method except incandescent electricity. Will *not* scorch or discolor your ceiling, etc. Eliminates possibility of fire. Gives well distributed shadowless light without dangerous and unpleasant heat—delightful to read or work by.

The Angle Lamp

is the simple, economical, convenient and perfectly satisfactory method of burning common kerosene. It *never* smokes or smells whether burned at full height or turned low. *Lighted and extinguished like gas.* Filled like a water bottle. Requires filling about once a week.

The Cheapest Form of Light

Being fully ⅓ to ½ more economical than even the ordinary lamp it soon saves its cost. It is made in 32 varieties. Come in and see it or *write for catalog.*

Hay.

Arrivals of hay for this week have been 7600 tons. The total amount of hay that we have received so far this month makes the immense sum of 26,000 tons, which amounts approximately to about 6000 tons more than we received during the same period last year. With the demand at the present time apparently considerably less than in former years, has caused to be accumulated a surplus of hay here in the city as the result of these immense shipments.

Under present condition of the market it is perfectly natural that no buying is being done in the country for the reason that purchases cannot be made in the country for shipment to the city at this time on any satisfactory basis. Everyone is receiving such large quantities of hay here that a decrease in shipments is desired so that an adjustment of conditions can be effected thereby.

There has been very little hay shipped away recently, with the exception of alfalfa hay, which had been sold some weeks ago for shipment to the northern country. Alfalfa hay is firm at the recent advance, and what has been arriving has been readily placed for shipment and otherwise.

What straw has been arriving recently has been difficult to place at any figure that could be called satisfactory, and the trade on this article at this time and under these market conditions is very limited.

Fancy wheat	12.00@13.0
No. 1 wheat or wh and o	9.50@10..5
No. 2 wheat or wh and o	$8.50@9.0
Choice tame oat	8.00@9.5

Shorts	26.00@27.00

Deciduous Market

SACRAMENTO, Cal., Aug. 27, 1910.

The following circular of the California Fruit Distributors gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, August 26, 1910:

Peaches.

One hundred and eighty six and one-half cars. Peach shipment has been much better maintained than was expected one week ago. It is, however, below that of last week. Salways are now going forward in liberal quantities and will continue for the coming week, after which time there will be but few to offer. Levy's clings will also go out in considerable quantities next week and we hope for a wide distribution which will put this popular fruit into general consumption throughout the great Western and Southern territory.

Plums.

Twenty and one-fourth cars. Shipment of this fruit has now dwindled to insignificant volume and will undoubtedly be considerably less during the next seven days.

Pears.

One hundred and ten and one-fourth cars. A little more than half as many pears were shipped this last week as during the preceding one. It is expected there will be a still further decline during the week to come. There are practically no Bartletts moving, shipment being confined largely to fall and winter varieties.

Grapes.

Three hundred and one and one-fourth cars. Gradual increase in shipment is shown, but as predicted last week, the output of Malagas has declined and will continue to do so, while that of Tokays has increased. Florin is now forwarding her Tokays in fairly liberal quantities and the Lodi section will be shipping freely next week. Thompson Seedless are nearly out of the market. Black Prince will be available in such quantities as may be desired during the next ten days.

Weather conditions have been favorable since our last report.

ALMOND MARKET.

Manager Dargitz of the California Almond Growers' Exchange reports:

New York market on spot Tarragona almonds seems to be firmer at 15½c for selected lots. Offerings for October shipment at 16c. Every quotation for October shipment is higher than for present.

France has suffered severely this year in all her crops of nuts, fruits and grains. Every sort of foodstuffs is advancing. Almonds will advance shortly too. October will see record prices.

We are making some sales and have begun shipping. Expect to shell three cars this week.

It is rumored that walnut prices will be fixed, in about two weeks, around 13c.

We have rather less than 75 cars yet to sell. Indications are that the crop will not be as heavy as has been estimated. This should help us to get the prices we have indicated.

Citrus Market

LOS ANGELES, Cal., Aug. 31, 1910.

Thirty cars a day has made exceptionally light shipments for the month of August. The coming month will probably be still lighter. In fact, the total estimated crop to go is 1000 cars. At 30 per day this would clean up the market before the 10th of October, and during October of last year over 800 cars were forwarded. This gives almost positive assurance that the small quantity of fruit to go will command top of market. Present prices are running close to $4.50@4.75 f. o. b. Eastern points. This is for good quality regular sized fruit. Offs and greens are running a dollar or more under those figures, according to the amount of greenness shown.

The fall cut of lemons is very light. The receipt of foreigns is also limited so that everything now being offered is picked up quickly and nets the grower not far from $4.50 f. o. .b. Coast. Present indication is that the cutting will be very light from now on. Whether this is due to lower vitality of the trees caused by the cold weather, or other reasons, is a subject much discussed, but immediate results of the cold should have passed so that at this time normal crop should be ready for cutting from trees.

Shipments.

Total shipments of citrus fruits to date since November 1st, 1909: 28,739 cars, of which 24,385 were oranges and 3,254 lemons. To same date last season: 35,933 cars, of which 30,119 were oranges and 5,814 lemons.

NEW YORK, Monday, Aug. 29.—Ten cars of oranges and one car of lemons were sold. The market was strong with higher prices on good stock oranges, easier on poor stock, strong on lemons and on grapefruit with higher prices. The weather was cool and showery.

FAREWELL TO THE TREES.

In the march of progress and improvement of Euclid Avenue running through Ontario and Upland, San Bernardino county, it has been deemed necessary to sacrifice the big eucalyptus trees, on the west side of the Methodist Church property, and at a sort of farewell meeting held last Sunday evening, under the trees, by the Methodist people, the following verses, composed by Mrs. L. G. Cochran, were read by her:

A Scene Near Porterville, Tulare County.

A feathery bloom 'neath a southern sun,
  A seed in a cup of brown;
The warm moist earth, then a tiny tree,
  Their beneficent life was begun.

In beauty and grace they grew apace,
  And rustled their leaves in glee,
When the murmuring breeze on summer eves
  Came softly in from the sea.

As the years went on they grew sturdy and strong,
  And towered toward the heavens, blue;
While at their feet, near the shaded street
  A thriving village grew.

Beneath their shade a church was made,
  And sentinels tall and fair.
They guard the groups of worshipers
  Who come to the house of prayer.

They whisper hope to the mourning ones
  Who pass 'neath their sheltering arms,
As they point above to a realm of love
  Unvexed by earth's alarms.

Their leafy tops give place for a home
  Such as singing birds love best,
And the vibrant air thrills with melody rare,
  As they fashion the dainty nest.

The message of love first learned in a grove,
  There verdant monarchs recall,
Since unseen by His eye, from the branches on high,
  Not even the dead leaves fall.

The Father above in his infinite love
  Made the plants and the trees to live;
Not merely to feed our physical need,
  But a nobler pleasure to give.

Who plants a tree is a friend of man,
  A blessing on all of these.
But alas! that man should wantonly plan,
  To destroy the beautiful trees.

Stately and tall, a joy to all,
  God's marvelous gift to man,
Oh, let them abide in their beauty and pride,
  Nor spoil His beneficent plan.

—Upland News.

While a Missouri woman was baking a beautiful cranberry pie last week a sack full of balloon ballast struck her chimney with a thud, knocked it down and ruined the pie. What Missouri needs is a speed limit for ballast—or stronger pie!

Riverside has shipped over 3909 cars of citrus fruits this season.

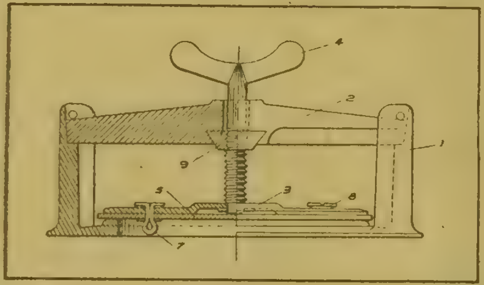
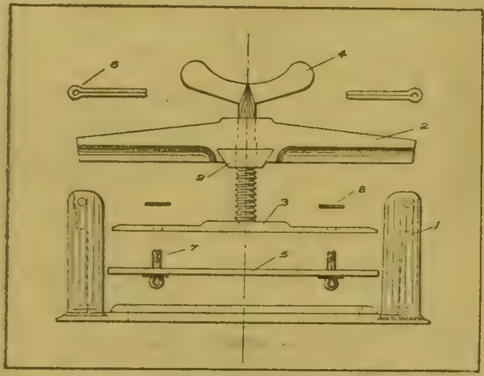
POMONA CIRCULAR VALVE





THE main object of the Pomona Valve is to construct a very cheap and simple valve, and one that requires no special tools or wrenches or experience to operate.

The Pomona Valve is constructed with non-corrosive parts, thus insuring a workable valve regardless of infrequent use. All fastening held in place by cotter pins, thereby making a very cheaply constructed valve and yet a very substantial one.

WESTERN DEEP TILLAGE Disc Plows

The Pluto, Jr.

The Plow that Does the Business When All Others Fail

Specially renowned for their great **strength, durability** and the **simplicity** of their various adjustments. Constructed on **correct mechanical principles.**

You don't have to send a master mechanic to the field with 'em. Specially constructed discs that will not break.

Look at the Construction

Why should the **frame of a disc plow drag on the ground** when you want to plow ten inches deep any more than that of a **mouldboard plow?** Who would buy a mouldboard plow if the **frame dragged on the ground?**

Then why buy a disc plow that does this **when** you can get the PLUTO JR., which **has more clearance under the beams** when the discs **are** in the ground, **even deeper** than it is **possible** to put them on the other type of plows before their discs have even entered the ground.

Built in one, two, three and four disc sizes.

Furnished also for engine plowing.

Catalogue and full information on request.
